The operations of these services cannot, on any intelligent principle, be left to free trade. Almost every American city has started by having several street railway corporations, and more than one electric or gas corporation; but the irresistible tendency has been for absorptions and amalgamation to take place until a monopoly has been established—a clear indication that the services come within the domain of natural monopolies. When, however, monopoly is reached through the stress of competition and the operations of graft, the undertakings are greatly overweighted with capital and burdened and drained by vested interests, progress is retarded, and cheap rates made impos-The obvious conclusion is that public lighting services which are monopolistic in character should be kept in control by the municipality. It should not allow privileges which the community creates to pass beyond its power.

There is little difference between the principles involved, whether the public service franchise is for gas, electricity, or street railways. Compensation can be granted to the city for gas supplies on two systems: a tax per cubic meter of gas sold, as in Paris and German cities, in which case the money goes to the

municipal exchequer and insures the city getting a share in the profits; or the enforcement of a sliding scale, the operation of which enables the corporation to increase its dividend as it lowers its price—a system which enables the consumer to benefit.

The same systems could be applied to electricity supply. Street railway corporations operating under franchise can be made to pay fees either through a percentage of gross receipts or in some other way.

It is quite feasible and practical for a city in various ways to grant public service franchises, but the system has drawbacks. Social interests enter very largely into the operation of all city services. It is in the interest of the community that light should be as cheap as possible to the poor, and it helps the police to have the streets well lighted. Efficient and cheap transportation has an important influence on health, and promotes well-being. Corporations which exist solely for making profits will not, as a rule, risk a fall in their dividends in order to cheapen a commodity or popularize a service. The corporations have always an eye on the end of the franchise period. They regulate their operations accordingly. They cease to introduce new methods, they neglect adequate maintenance, they allow their plant to become dilapidated; and naturally so, as the future is uncertain, and they want recoupment and profit.

From a theoretical point of view—assuming for the moment that there are no administrative difficulties—let us see how complete municipal ownership and operation would work. Take street railways. The City Council owns the railroad laid down in its own streets. It can regulate the time of construction so as to be least inconvenient to the people. The routes would be planned also in conjunction with street improvements, clearing of slums, and rehousing the poor. A corporation holding a limited franchise has no interest in the permanent development of a suburb.

The City Council would always adopt the best systems of transportation, as it will live to reap the benefit. It would have some regard to the appearance of

its cars. It would be a model employer. Fair wages would be given and reasonable hours observed. Its car conductors would be provided with neat uniforms. They would be smart and civil. municipality would study the needs of special classes. For instance, there would be cheap cars for workmen, morning and evening. There would be special services to artisan colonies in the suburbs, to parks and pleasure grounds. The citizens would be made to feel in every way that the cars were their cars, and that every cent they paid would go towards the improvement and development of their own co-operative property. A municipal car service can be made an excellent means for stimulating civic patriotism.

Then the municipal car system would dovetail into the work of other departments. The cars would be run at night to collect city garbage, market produce, etc., and the day load of electricity required for street railways would be welcomed by the city electricity department.

All these features of a municipal street railway system, which I say are possible, exist in British and Continental cities. But we can imagine a publicly owned street railway service and subways going much further. The system of transportation in a city is an essential element in its life. The better it is, the more it aids business, the more it adds to social amenities.

In some British cities the average fare is a little over one cent. It is only a step further to socialize the street railways as we have socialized the highways, bridges, and ferries (for the use of which in former years tolls were levied), and introduce free transportation—that is, free in the sense that the use of the streets, maintained out of local taxation, is free, and the use of elevators in high buildings (paid for in the rent of the rooms) is free. I only refer to the Utopia of free travel to emphasize the difference between private and municipal operation of street railways. While it is the aim of all cities of which I know to make their municipal railways self-sustaining and profitable, there are cases where a city deliberately incurs a money loss for the

sake of a social benefit. Huddersfield, a large manufacturing city in Yorkshire, established tramways because companies refused to do so, and ran them for years at a loss, for the general benefit to the The steep gradients and community. hilly streets which the cars had to climb made horse and steam traction both unprofitable, but the conformation of the site made transportation facilities all the more necessary. Electric traction has now turned the city car system into a profitable undertaking. In Cologne, Düsseldorf, and other cities, street railways are run several miles beyond their borders to municipal forests at such low fares that loss is incurred.

The same principles of social benefit arising from cheapness of service should operate in the case of electricity and gas supplies. Both services under municipal ownership can be managed on parallel lines by different committees. Under the Scottish municipal code, municipalities are precluded from making profit. The surplus is devoted to reducing charges and improving the services. This system is not yet general, as municipalities prefer to manage their undertakings so as to give a commercial instead of or in addition to a social profit. A commercial profit means that the surplus left after meeting all payments for maintenance, depreciation, interest, redemption charges, etc., is handed over to the relief of local taxation—thus benefiting all taxpayers. When the other system is adopted, the benefit in the form of a cheaper service is confined to con-The contrast between the two sumers. systems is most striking in the case of street railways in London. In the wealthy and crowded financial center of London and in the rich West End districts tramways are not permitted, yet the rich taxpayers in these areas get a share of relief which comes from the pennies of the poor who use the tramways in other quarters of the metropolis.

Hundreds of municipalities in Great Britain and in Continental Europe own and manage efficiently both gas and electricity undertakings. One necessary condition for cheapness of production is for the municipality to supply all the city, and not merely produce gas or generate electricity for its own requirements. It is economically wasteful, for instance, for the city of Chicago to distribute electricity all over the city only to light the street lamps.

In Continental Europe the franchise system has existed both as regards gas and electricity, although it is now being discontinued. It did not give low charges and did not make for efficiency. The sole object of the concessionary corporation is to reap the richest harvest it can during the period of the franchise, without regard to the future of the undertaking or of the city's needs. In Great Britain the franchise system was adopted for electricity supply. All companies were limited by statute to forty-two years, at the end of which period the municipality takes possession on payment of "the then value" of the plant, without compensation for good will or displacement. This system retarded development so that most of the companies have been bought up long before the franchise expired, receiving sometimes double their capital expenditure. And it has paid the community to give this compensation in order to develop the business and lower the charges.

Municipal ownership in Great Britain has been more enterprising than corporation rule; it has always considered the interests of the whole community, and has invariably meant lower charges for consumers.

The same principles of public utility which apply to street railways, gas or electricity supplies are applicable to telephones and the distribution of hydraulic power, or any other service which is monopolistic in character. Telephones, while managed successfully by municipalities in England, Norway, Sweden, and Holland, present some difficulties. Localization is not desirable and isolation is impossible. There should be only one telephone system in order to have the best facilities for intercommunication. The telephone service works most smoothly and answers public needs best in European countries where it is a State monopoly under the post-office. With the telegraph system a State monopoly, as is the case throughout Europe, it is an anomaly to have the telephones under separate management.

IV.

The general principles of municipal ownership will probably find ready acceptance as theories of civic policy, but what about their practical application? It will be pointed out as an initial material difficulty that street railway systems, gas and electricity supplies, cannot be limited by city boundaries. They should serve many areas governed by different authorities. Provided all these authorities are animated by the same ideas of civic policy, the difficulties disappear; working arrangements mutually beneficial are entered into, or joint services are established, and parochialism gives place to a wider civic patriotism, which recognizes larger communal interests. matter of fact, the large cities in England serve their smaller neighbors with water and gas, and are now beginning to do so more and more with street railways and electricity.

The most powerful and convincing arguments urged against municipal ownership are not, however, advanced on practical but on moral and political grounds. Let the municipality extend its activities and you enlarge the opportunities for patronage. Add to the number of public employees and you swell the power of the party boss. Give the municipality more money to spend in contracts and supplies and you widen the doors for grafters. Municipal ownership, in fact, means more politics, more corruption, more dishonesty in public life, and more power in all elements which degrade a city and demoralize a people. These are the last words, the final crushing arguments, of the antimunicipalists. They apply only if we grant one large assumption and make a humiliating confession. If we take it for granted that the evil elements in a community are permanent, that corruption will forever triumph, that politicians will more and more make public plunder their business, that the sense of citizenship and the moral conscience of the Nation will continue to wither and fade, then the case against municipal ownership is complete, just as it is against every form of good government.

If, on the other hand, we have still faith in the moral regeneration of the people, still believe that purity in politics and public life is possible, then municipal ownership is the greatest and final means of reform. It is radical; it goes to the root of the matter and gets rid of the mainspring of corruption. Grafters, corrupt politicians, and all the other parasites who now live by plunder could not exist if there were no franchises to sell, no contracts to give out. Let the cities keep their franchises, operate municipally their undertakings, and the chief source of corruption and the means of temptation will disappear. So long as corporations and contractors are mixed up in city administration so long will the tempter be there, and grit will interfere with the smooth working of the municipal machinery.

But, it may be urged, admitting that one evil is eradicated, others are more strongly intrenched. The patronage which falls to the City Council is increased and the power of the city employee is greater—both dangers from which we now suffer. Having extinguished the tempter, the next step is the moralization of the city councilor and the purification of the civil service neither impossible reforms. The city councilor has long since been discovered in Germany and Great Britain who is prepared to serve his city without any ulterior motive-ready to give his ability and his time freely and honestly to the service of the people. He is making his influence felt in the United States; and without this public-spirited servant, animated by a sense of citizenship, who subordinates all selfish aims, municipal ownership cannot succeed.

Its success also means that a permanent civil service for cities must be organized above party and solely on merit, which only involves an extension of the system which has been introduced successfully in various departments of the United States Government.

While this political danger from the city's employees is always heard of, nothing is said of the much more serious influence of the corporation directors,

lawyers, and stockholders. The political dangers feared from an army of municipalemployees have never yet been apparrent in British cities. To begin with, the workers benefit doubly by municipal ownership—they share in its general advantages and receive just treatment, for a municipality must always be a model employer. Then the interests of the city's employees are divergent. Workers in various departments, while having the same employer, have not common interests. Combination among all is not practicable. In the most developed of British cities, where every public utility service has been municipalized, the municipal employees have not proved a serious factor at election times, partly from the reason that they are too good citizens to attempt a systematic and combined campaign which would lead to reaction, and also partly from the fact that a large proportion of them live outside the borders of the municipality which they serve. Were combined action ever attempted against a common municipal employer, such a foolish proceeding would lead to the drastic remedy of disfranchisement, just as the civil servants in Washington are deprived of their votes, although not for the same reason. The interests and well-being of the whole body of citizens would always preponderate over the action of the city's employees, who must always be a comparatively insignificant minority.

V.

There are those who will admit the whole of these premises, but still only regard the system as an ideal to be reached in the far future. Such would argue that the time is not now opportune; we must go through a transition period; we could not get honest officials; we could not trust the people yet; they do not know how to use their votes. The enemies of reform always fly to dis-

trust of the people. The same reasons were advanced for withholding votes from agricultural laborers in England. They would not, it was said, know how to use them. They could not be trusted. People will never learn how to use political privileges until they get them, and, similarly, people will never know how to run municipalities under municipal ownership until they get the opportunity. There will at first be a period of stress, trial, and turmoil, when loyalty to the people's cause will be strained, when the old system will strive hard for mastery. This experience is gone through before all great reforms are firmly established, and has been successfully weathered by loyal service and steadfast courage.

Municipal ownership, it should be borne in mind, withdraws from public life the influence of the stockholder, who, when he goes to the poll, has conflicting aims to consider—his position as a citizen and his interest as a stockholder. When the city keeps its franchise and operates its undertakings, it becomes an industrial commonwealth, as far as public works are considered, with all the citizens as its stockholders. Once the barrier is past, once the new civic régime is inaugurated, the citizens will not be so short-sighted as to damage their own property. Those of them who hold city stock, bearing its moderate but certain return, will not like its value depreciated. They will prefer to see their city's credit stand well in the market. All other citizens are also partners in the co-operative undertakings which they use themselves or derive benefit from. As good citizens they will do nothing which is likely to impair the efficiency of their co-operative enter-Rather they will seek to develop prises. them within their legitimate sphere, and widen the benefits which they confer on the people.

A SETTLEMENT FOR THE NEG-LECTED RICH

BY A MEMBER OF THE ADVISORY COMMITTEE

O one can engage in work for social betterment in New York without being impressed with the need of some form of missionary or humane effort for the benefit of the neglected rich. True benevolence is not exclusive. It is not limited by social, racial, or sectarian considerations. It distinguishes between men and the conditions which surround and hamper them. If one has had the misfortune to be born rich or to acquire riches, why should that exclude him from the pale of human sympathy or from the operation of those forces which are necessary for his humanization?

I do not find in any directory of the charitable or social settlements of New York any mention of our Settlement. I am not surprised at this. Its work has been done quietly and without the necessity of public appeal. Whatever else this Settlement lacks, it has no lack of money. It was organized, indeed, to secure for the neglected rich certain things which money cannot buy and to establish certain relations which money does not determine. Its prime object is to establish a higher standard of living. It would have been a mistake, therefore, to establish it on a gold or silver standard. The settlements on the East and West Sides of New York have shown that a splendid type of humanity can be developed under the limitations of poverty, and the object of the Settlement in the rich quarter is to show that a splendid type of humanity may likewise be developed under the limitations of wealth.

Another reason for its comparative obscurity is that there is already too much ostentation in social life, and this Settlement, if it stands for anything, stands for an unpretentious reality. One of its fundamental mottoes is, *Esse quam videri*. Reality is a friend of simplicity. Ostentation is by no means confined to the rich, but it thrives among them be-

cause it is much easier to convert money into display than to change it into character, and because many people believe that money is made for just this thing. The new Settlement is, therefore, anything but loud. It avoids self-proclamation. I write this article on the condition that you will not ask me to tell just where the Settlement may be found. Suffice it to say, it is in a quarter where its influence seemed most needed. There was no trouble in getting the necessary building, for there are not a few rich people who are thoroughly alive to the condition of their wealthy neighbors. Nor was it difficult to get social workers, for there are many people on the East Side who are as willing to help the neglected rich as they are willing to be helped by them.

The new Settlement has been named the Half-Way House, not because things are done here by halves, but because here one half of the city is teaching the other half how to live. If the settlements in the poor districts are of great value in bringing the poor into neighborhood with intelligent and friendly coworkers, why should not a Fifth Avenue settlement be of equal value in bringing the neglected rich into friendly relation with the intelligent poor?

A careful study of the population of New York will show that the intellectual center is not on Fifth Avenue, but on the East Side. What we are trying to do is, by a selective process, to get some of the teeming intellectual activity of that side to leaven the sluggish intellectual life of what, by conventional and unconscious satire, is called the "Best Society." The establishment of study classes of every kind and variety was one of the first steps. History, literature, geography, science, philosophy, languages, are taught, and people who have been trying to banish the ennui of life by the monotony of bridge whist are

Digitized by Google

beginning to learn that there are other forms of intellectual resource. Already. I am told, the influence of the new intellectual spur is felt in a stimulated sale of standard works in the book-stores. Men who have spent large sums of money for show libraries are even beginning to read them. Some of the members of our clubs have told me that they did not dream what a wealth of learning could be found on the East Side for the education of the needy rich, till they began to come to the Half-Way Settlement. Some of the best of these teachers are found in the Jewish popula-They are men of opulent learning and intellect, who have been driven from their homes in the Old World and are earning but a precarious living in the New. I am wondering what some of the needy rich would do if reduced to similar extremities in a foreign land. Could they live on a few cents a day, and would they be found, while standing behind a push-cart on the street, reading the Ethics of Spinoza in Hebrew, or in any other language? The effect upon our rich beneficiaries has been excellent. They are learning to recognize their superiors. People whom they had looked down upon they now look up to.

One of the fundamental principles of the Half-Way Settlement is that everybody who is not defective by birth should be of some use to society. We do not put a too literal emphasis upon the word "use." We recognize that some people and some things are useful to society because they are ornamental. But what shall we say of people who are neither useful nor ornamental? are the hardest cases we have to deal with among the neglected rich. are what we call our "non-support cases." There are young men and young women who have grown to manhood and womanhood without learning how to support themselves or how to support others. They have been supported by their fathers and grandfathers. They have neither learned how to make money nor how to spend it wisely. They live lives of self-indulgent leisure. Idleness, whether among rich or poor, is the mother of vice. If such men lived on the East Side, we should call them "bums" or

"vagrants;" the fact that they live in elegant residences forbids the application of any such term to the rich loafer. He is secure in his respectability because, though he has not earned it, it has been bought for him. The legal definition of a vagrant is "a person who has no visible means of support." This definition would not apply to the rich tramp. fault with him is that he has no means of support which are *not* visible. has no moral or intellectual resources. He has become thoroughly materialized. enameled in his wealth. It is hard to find the man beneath all this armor of gold and silver; the thing seems either stuffed or hollow, like the armored knights in the European museums. "Very good sheathing," you say, "but where is the man?" Now, what the Half-Way Settlement has shown is that there is often excellent material for manhood under all this junk, if you can only get at it. We are not to be too severe with the poor tramp or the rich tramp; the difference between them is a difference of circumstances. Each has been the They have victim of a false education. not been trained into the duty or the joy of work. The rich tramp has been furnished by his parents with a free pass; he rides on a Pullman car; the poor tramp rides on the truck beneath. different course of education might have changed entirely the lives of these men. I am often more hopeful of the rich tramp than of the poor one. the rich one needs in many cases is to lose his fortune, and then he shows of what splendid stuff he is made; he loses the jewels his grandfather left him, but he finds the Shakespearean jewel in adversity. As for the poor tramp, he has adjusted himself to adversity already, and if he had a fortune bequeathed to him, he would simply take life a little more comfortably; he would ride inside the Pullman instead of on the truck.

It is part of the work of the Half-Way Settlement to teach the art of living. This many of the neglected rich have never learned. While some of them live a life of incessant pleasure, others have an unrestrained mania for work, and have never acquired the art of enjoying life as they go along, except as they find

Digitized by Google

enjoyment in their business. Hence their lives are narrow in their scope. They never take any vacation, and would not know what to do with it if they did. Hence we have started a Vacation School to teach some of our overworked millionaires that vacations are indispensable, and how to use them. Some of our neighbors have found trips to Europe rather wearisome, because they have had no preparation for visiting the countries in which they have traveled, and know nothing of art, literature, or the history of these countries, and less of the languages. For this purpose we have established what we call East Side Fellowships. Under the terms of these fellowships persons who are approved by the Advisory Board may go over to selected families on the East Side and live with them for from six to twelve months to acquire the languages, while taking courses of collateral instruction at the Art Museum and elsewhere.

The East Side is not without its æsthetic influence, too. A single instance will illustrate. The truckmen and teamsters do not dock their horses' tails. They know that during fly time these tails may be very useful to the animal, and what does it matter if occasionally the horse gets his tail over the reins and undertakes to drive himself? Laws do not need to be passed to deter their owners from cutting off their tails; they respect nature. Fashion, not nature, is the god of the neglected rich, and so they mutilate their horses for the sake of appearances. Now, in the Half-Way Settlement we have not tried to combat this merely by any humanitarian, equitable, or equitant argument; we have approached the problem from another We have had some Greeks from Roosevelt Street give a few lectures with stereopticon illustrations on Greek One of the lectures was entitled "A Greek Horse Show." The illustrations were nearly all taken from the frieze of the Parthenon. Our lecturer incidentally remarked that when the Greeks held a horse show they went there to see the horses, and he called attention to the fact that none of the Parthenon horses were docked. work of art mutilated in that way could have been knocked down to a Greek buyer; on the contrary, they would have promptly knocked down the artist, were he Phidias or Praxiteles, who should have attempted such a travesty. Some of our neighbors have begun to see that the custom is not æsthetic, and that it is even ridiculous. I predict that ere long at the New York Horse Show no horse which does not conform to the Parthenon ideal will take a prize, and I am confident that more people will go to the show to look at the horses.

As in art, so in music, the East Side has a great deal to teach the neglected rich. It is there that we find great musical enthusiasm and deep musical feeling. We are bringing some of this into our Settlement. To the credit of the neglected rich let it be said that music is highly fashionable; it is their misfortune that to a large number it is nothing more. Highly dressed, or but partially dressed, women go to the concerts or opera because they would lose social caste if they did not. Young ladies learn to drum on the piano because they are expected to, and others assume to sing. But no one who has not been in touch with the neglected rich can really fathom the denseness of their ignorance on the subject of music. friend of the Settlement found a young lady, the other day, who had been taking lessons for three or four years in singing, who had not the slightest idea of the formation of the minor scale. One of the most generous of American millionaires has done splendid work in fostering music in the metropolis. He is the president of the Philharmonic and of the Oratorio Societies, and we are wondering if Mr. Carnegie will not suggest to us some way in which the dense ignorance of this zone may be still further dissipated.

One of the most important of our classes is that on Home-making. Some of our millionaire neighbors have palaces, but not homes. We are busy now in taking a census of the homeless rich. I mean the people who have every thing out of which to make a sumptuous home, except the most essential element of all. Happiness is not a thing, and a home cannot be made out of things; happiness

is experience, fruition, and there can be no happiness without love. I know of nothing more pathetic than these loveless palaces—the mere outward shell of a home, but with no heart, no love, in them. Solomon was right—Better is a dinner of herbs where love is, than a stalled ox and hatred therewith. The only thing more terrible than riches without love is poverty without love.

One of the frequent misfortunes of the rich is that they lose too much of the simple beautiful pleasures of domesticity. It is hard to maintain simplicity in a palace. The whole standard of living is apt to be changed, and men lose the happiness which comes from the round of simple enjoyments, as well as still deeper sources of happiness. Mothers, because they are rich enough to hire nurses, yield to the fashion of turning their children over to a nurse or a governess, instead of taking care of them themselves. The result is that the child loses its mother and the mother loses her child. Sad it is to think of the orphaned children whose parents are not dead, but who have no time to learn to know their own offspring. Our committee has therefore formed a Mothers' Baby Club, the object of which is to make mothers acquainted with their children. We encourage them to nurse their own babies when physically able, to go out with them in the park and push the babycarriage themselves, instead of intrusting them to a maid. One of the pleasantest sights in our neighborhood now is to see fathers and mothers going out with their children, the man carrying the baby, and having a little picnic in the park by themselves, just as if they were not outrageously rich. Mothers have told me that they never dreamed it was so delightful to nurse their own children and to care for them themselves instead of committing them to paid nursery-maids.

I have no space to tell of our classes in ethics and good government. Some of the discussions as to the ethics of business have been greatly stimulated by recent events. As a practical result of ethical discussion I am told that some of our rich women are becoming more prompt in paying their dressmakers' bills. Subjects of hot discussion have been,

What is the relation of life insurance to benevolence? and What should be the salaries of missionaries? Another subject is, What is the ethical relation of gambling in high life to gambling in low life, between bridge whist on Fifth Avenue and craps on the East Side? Some members of the Plato Club from Henry Street have also introduced the question with which Plato's Republic opens, whether men who simply pay their debts fulfill all the conditions of justice. As for good government classes, I hope that eventually we can say that there is as much enthusiasm in civic affairs in our neighborhood as there is on the East Side.

The Half-Way Settlement has been established but a little while. It is too soon to count up results. Some of the tendencies of the experiment may be gathered from what I have written, others may be inferred. But of one thing we are positive, and that is that the Half-Way House has done immense good by bringing together people who should never be separated, each of whom needs the other. This is not a charitable movement, it is an educational one. A clear and positive and I may say a priceless result is that the rich and the poor are educating each other. Indeed, we have got so far now that we hardly apply these terms in the conventional way. A new sense of values is evident at Half-Way House. If we call a man rich, we mean in the things which make manhood and happiness; if we call him poor, we mean poverty of life.

The Half-Way House is truly democratic; it is also truly aristocratic. We are seeking to get the better elements to the top in the life of the individual and in the life of society. That is the true aristocracy of intellect and of soul, and the question of geography, whether East Side or Fifth Avenue, has nothing to do with it.

The social commingling of the poor residents and the rich beneficiaries has wrought the finest results. Each has come better to understand the other. Some of our resident workers did not at first get into a sympathetic understanding of the view-point of the rich man, nor did the people of the neighborhood

at first always understand our workers. Each was too much influenced by the circumstances of the other. This state of observation and curiosity has passed into one of true fraternity. To fraternize means to humanize. The basis of all permanent human relations must be found, not in superficial and temporary distinctions, but in the deeper elements of our common humanity. Here alone is the foundation of true brotherhood.

So it is that a most delightful relation has sprung up between residents and neighbors. The rich are surprised to find the noble qualities of our residents, and our residents are learning day by day what splendid men and women may be reared in luxury in spite of enervating influences. Over our door we have put up another motto, the words of Burns:

"The rank is but the guinea's stamp, The man's the gowd for a' that."

A VICTORIAN GROUP'

TITH a lively recollection of the charming correspondence between Thackeray and Mrs. Brookfield, published several years ago, one opens these new volumes with pleasant anticipation. The biography of William H. Brookfield fills the first part, and he appears as a handsome, talented, and already popular youth. After hesitating between the Church and the bar, he prevailed upon his parents to permit him to go to Cambridge, where began his lifelong friendships with a group of men who formed the magic circle of which Mrs. Brookfield was later the center. He was admitted into the inmost ring of the group, which included Thackeray, Tennyson, Arthur Henry Hallam, Kinglake, Venables, Milnes, and others. He became tutor to the eldest son of Lord Lyttelton, another connection that widened his friendships. He began, during his residence at Hagley, the seat of Lord Lyttelton, to record in his diary such anecdotes and incidents as he gathered from distinguished guests who were in touch with the world. A certain Hawkins Brown. who had been cured of stammering, managed to get through a sentence in a speech by singing it to a tune. "If the sentence happened to be finished a few bars before the end of the melody, still he went through the latter in order to start fair with the ensuing sentence. The effect in the Commons was most ludicrous, and some wag one day echoed the dying strain. Sheridan, in the

¹ Mrs. Brookfield and Her Circle. Edited by Charles and Frances Brookfield. Charles Scribner's Sons, New York, 2 vols. \$7.

House, called him 'his melodious friend.'" Lord Spencer told Mr. Brookfield that Bozzy used to come to the Johnson Club half drunk, and was loud and overbearing in his talk, which was chiefly of Johnson.

Through Mr. Brookfield's friendship for Arthur Hallam he met his future wife, Miss Jane Elton, who was a niece of Mr. Hallam the historian. A portrait of Brookfield in cap and gown shows a fine intelligent face, while a copy of a painting of Arthur Hallam at the age of sixteen is charming. The college correspondence of these youths is as merry and extravagant as possible, and shows them in all their gay humor. In 1836 he became curate of Holyrood, Southampton, where within a year or two the Elton family came to live. Of the childhood of Jane we have a few piquant glimpses. The little girl used to have her lessons lying upon a hard board with a hollow for the head; she also wore a "spider," a web of iron or steel covered with leather, which braced the small back from neck to waist. Stern as this system appears to us, it was owing to it that Mrs. Brookfield preserved to the end of her long life her stately figure and carriage. She was the youngest daughter in a family of eight girls, hence her second name, Octavia. Her three brothers were devoted. and all the family had a refreshing belief in one another's talents. Jane was a beauty, and a witty and delightful companion. Her father, Charles Elton, was the friend of Lamb, Landor, Southey, Coleridge, Turner, and others, so that she was born into the literary atmosphere which she breathed to the end of her life. The Elton children would sometimes note, "Nothing occurred—only Old Landor called oftener than ever." Jane writes: "One day he said he had left a drawer full of Southey's letters at home—letters he had treasured and intended to keep, but 'My wife has been so good as to burn them,' and he gave the loudest burst of laughter I ever heard."

Mr. Brookfield was twelve years older than Jane Elton, and that fact may account for the tone he adopts in his letters to her after their engagement. He was the severe mentor, yet at the same time praised the wit and drollery of her letters. Much affection was expressed, with gay descriptions of social events and occasional rebukes quite startling to modern ears. To reprimand a young lady for the "blackguard sluttishness" of her letters has happily passed out of fashion. The Brookfields were married in 1841, and began their new life in Jermyn Street, London. Their friends rallied to them, and new and old gathered at their table to enjoy the feast of wit "in a sphere more brilliant and far more exclusive than any that has existed since." Brookfield was introduced to London society at her uncle's house. Mr. Hallam was fond of his niece, who always retained a feeling of awe for the punctilious gentleman. His second son, Henry, who also died in his youth, occasionally referred to him as "the author of my days and the Middle Ages." Thackeray was a constant visitor, and at Christmas made Mrs. Brookfield his first present one of his books. During her absence from home Mr. Brookfield wrote to his wife that "Titmarsh" had sent him the following invitation:

"If you like two or three
Of your cronies to see,
There's a swarry
To-morry
At Mitre Court B."

Theological discussions raged in those days as now, and Mr. Brookfield lost some preferment because of his audacity in the pulpit. He told the story of an old gardener of his father's—an example of definite and clear belief. He held that nobody could be saved who wore

short breeches. "I said to him, 'Now, Joseph, do you think St. Paul wore breeches?' With admirable power of debate, he answered, 'I don't know what he wore, Mr. William, but I'll tell you what he didn't wear. He didn't wear shirt collars up, velvet waistcoat, gold buttons, blue satin cravats, boots and straps—strutting about like a crow in a gutter' (describing myself in the year 1830 in detail)."

An amusing tale is told of Samuel Rogers.

"Walking the other day with an absent-minded friend, Rogers told him how a lady, half recognizing him the day before, had asked him, 'Isn't your name Rogers?' 'And was it?' asked the absent one." Mr. Brookfield makes himself merry over the flowing rhetoric of Bishop Wilberforce, vulgarly known as Soapy Sam, and cleverly travesties a sermon and ridicules a speech before the House of Lords by this prelate. Mrs. Brookfield thus comments upon Browning's marriage: "Of course you know that our friend Browning ran away with a sister poet the other day? Miss Barrett-Barrett (y two Barretts?) who has been nearly bed-ridden for years; they are now in Italy away from a brutish father, (selon Mr. Moxon) who opposed the match and entailed the necessity of its being achieved in a surreptitious (gracious | what a word !!) manner. Miss Wynn lent me Miss Barrett's poetic effusions with a strong encomium from herself. I see she has a good deal of poetry in her, but her 'Lady Geraldine's Courtship' is evidently conceived in consequence of reading 'Locksley Hall,' and the whole poem recalls it, though such a laboured piece of 40 pages was never put together I suppose.'

Among the Brookfields' friends was Miss Wynn, who wrote very clever letters, often discussing the peculiar religious influences of the time. Oxford and Cambridge were in opposite camps, and the most unmitigated scorn was poured upon Oxford by these Cambridge men. Mr. Brookfield wrote seriously in answer to Miss Wynn's arguments, but his sense of fun occasionally moved him to such a declaration as, "Arthur Elton had turned Puseyite and now smokes to the East."

It was through Thackeray that the lasting friendship between Lord and Lady Ashburton and the Brookfields was commenced.

Lady Ashburton was an ideal hostess, and had the gift of bringing out her guests at their best. She gathered about her a group of literary people, among whom Thackeray and the Brookfields shone, with the Carlyles, Venables, and others. It is odd to read of these men and women amusing themselves with childish games, throwing the handkerchief and counting ten rapidly in order to avoid a forfeit. Carlyle told a story of his childhood. When he was four, his parents gave him an earthenware "thrift pot," a sort of bottle without mouth but with a slit in the side to slip pennies in. He was left alone in the house when there came to the door a beggar-man, pale, weary, worn, and hungry, dripping with wet. "I climbed on the kitchen table," says Carlyle, "and reached down the thrift pot from its shelf and gave him all that was in it—some fourpence. I never in all my life felt anything so like heaven as the pity I had for that man." Mrs. Brookfield says: "How different this from 'the inward satisfaction and pride resulting from a virtuous action."

Mrs. Carlyle was not the easiest guest to entertain. In the large parties at Lady Ashburton's she expected to take the lead, which was difficult, as her brilliant hostess was the first attraction everywhere. Clever and amusing as she was in conversation, Mrs. Carlyle had a fatal propensity to finish off every detail of her long stories, and, with her Scotch accent and somewhat exacting temper, her audiences longed for abridgment or for an opportunity to have their own turn in the conversation. Mrs. Brookfield describes her as very slight, neat, erect, animated in face, with very good eyes and teeth, but no pretension to beauty.

Mrs. Brookfield gives us a glimpse of Miss Brontë through thoroughly feminine eyes, when she says that there was a fashion for wearing a plait of hair across the head, and as Miss Brontë, "a timid little woman with a firm mouth," did not have thick hair, she wore a very obvious crown of brown silk! Mr. Thackeray on the way down to dinner addressed

her as Currer Bell. She tossed her head and said she "believed there were books being published by a person named Currer Bell, . . . but the person he was talking to was Miss Brontë, and she saw no connection between the two." The story of Thackeray's party for Miss Brontë is well known, and its miserable failure is accounted for by Mrs. Brookfield. She thinks the keen-brained little lady was unable to fall in with the easy badinage of the well-bred folk she met in London, and was "dismayed at anecdotes that gained in elegance as they lost in accuracy."

Macaulay was seated beside Mrs. Brookfield at dinner when she asked him if he admired Jane Austen's works. "He made no reply till a lull occurred in the general conversation, when he announced, "Mrs. Brookfield has asked me if I admire Jane Austen's novels, to which I reply," and then entered into a lengthy dissertation to which all listened but into which no one else dared intrude. finally describing how some time ago he had found himself by the plain marble slab which covered the remains of I. A., when he said to himself, "Here's a woman who ought to have had a national monument."

Some one cruelly remarked to Tennyson that he would be as bald as Spedding before long. Mrs. Brookfield, writing to Harry Hallam, says: "Poor Alfred brooded over this . . . and put himself under a Mrs. Parker, who rubs his head and pulls out dead hairs, an hour a visit and ten shillings an hour, besides cosmetics ad libitum. Your father's hair would bristle up at the idea of the Queen's pension being spent in this manner, but really his hair is such an integral part of his appearance it would be a great pity he should lose it—and they say this woman does really restore hair, and she is patronized by Royalty itself! Can I say more in her favour or in extenuation for A. T.?"

It is pleasant to hear that Alfred Tennyson was regarded by his friends as eminently good-natured—a quality which, when combined with high genius and critical ability, must cause surprise. He appeared late for breakfast one morning and said, "My watch has stopped;

what am I to do?" All felt concerned for a moment, when Mr. Fairbairn with gravity took the watch from the poet's hand, asked for his key, wound it up, and silently returned it to its owner! With strangers he was shy and retiring, but with his friends his conversation was full of depth and earnestness—often amusing from its exaggerated flights of humorous fancy.

In 1859 Mr. Hallam died, after sustaining the loss of all his brilliant children. Gradually the circle was invaded, and the great blow came in 1863 when Thackeray died. Nowhere outside the great writer's family was the sorrow so keen as in the Brookfield household. Mr. Brookfield records the dreadful news simply—"Thackeray is dead." Mr. and Mrs. Brookfield were to an extent invalids, but both continued their work and social pleasures. Mrs. Brookfield wrote several books, which were well received, but are now forgotten. In 1874 Mr. Brookfield died, and Mrs. Brookfield survived him twenty years. The tributes of his friends placed Mr. Brookfield high in character and usefulness. In the Church "he had his Newmanic turn and then became something of Broad Church." Witty, sympathetic, loyal to his friends, handsome and popular, while he amused in public it was said that he left evidence to prove that he was equally apt in giving serious and solid comfort to those who desired it.

Mrs. Brookfield retained to the last the charming personality that insured for her the affection and confidence of a remarkable set of men and women for fully forty years.

As the compilers of these letters say, "None are likely to deny that those Victorians were, in their mental grasp and their quickness of wit, a rare and a wondrous race."

The letters speak for themselves, and are so complete in their reflection of the times and the people they represent that the slender thread connecting them is hardly more than a placing in order. The effect of the book is not as vivid as might be expected, but it is vastly agreeable, and adds a link in the chain which binds us to the time so difficult to call the past century.

Comment on Current Books

The Abbé Constantin

Halévy's pleasant romance, together with Fitzgerald's "Omar" and Dr. Holmes's "Professor at the Breakfast-Table," are issued as new volumes of the "Arcadia Classics." This series of classics and favorites is neatly presented in pretty and small books with flexible binding and acceptable illustration. (T. Y. Crowell & Co., New York. \$1.25 each.)

The lectures or addresses The Age of the which Dr. W. J. Sollas, Earth Professor of Geology at Oxford, England, has here included under the title of his Presidential Address to the Geological Section of the British Association cover a much wider field than the title indicates. In sufficiently popular form they present the latest hypotheses, researches, and conclusions of the science on points of primary importance, together with some of secondary interest. Dr. Sollas indulges in no venturesome guesses at the number of millenniums since our planet first took form. His nearest approach to certainty is that it is at least fifty-six or fifty-seven millions of years, and perhaps much more, since the moon, after having been flung off from the earth, was revolving within thirty-six thousand miles of it. The earth is still slightly pear-shaped, and until it comes to its ultimate spherical or spheroidal form the catastrophes of the past are likely to recur. (E. P. Dutton & Co., New York. \$3, net.)

The Building of the City Beautiful

a completed work of which, while incomplete, some portions were printed for friends. In form it is a romance embodying the author's visions of the City of God that is to be, for the realization of which Jew and Christian join heart and hand. In substance it is a sketch of the social Utopia which in the coming age will be based on Jesus' foundations, as given in the Lord's Prayer and the Sermon on the Mount. Suggestions of Thoreau, of Tolstoy, of Edward Bellamy, frequently recur to the reader, but the ruling spirit is that of the Christ, as the Saviour of

man from the inhumanity of man, and from his own baser self. The spiritualized affection of a noble man for the noblest of women, a Beatrice to a Dante, runs through the whole, and "the City Beautiful" at last appears in form as transcendently ideal as that in the Apocalypse. Taken as a whole, this work, whose chapters are each introduced by an appropriate poem, is a prosepoem on the evil that is, and the good that is to come—a work which in thought and art shows its author at his best. (Albert Brandt, Trenton, N. J. \$1.50, net; postage, 8 cents.)

"Don Quichotte", Don Quixote is an immortal character. It was never to be expected that he and his inseparable Sancho Panza would remain strangers to the stage. Some weeks ago in France the stage received a notable addition to its literary and dramatic forces by the publication of Jean Richepin's" Don Quichotte," and its representation at a no less distinguished place than the Théâtre Français, generally and justly considered the first theater of the world. In the new "Don Quixote," as in the old, we have a heroic-comic work. Its characteristic features, as created three centuries ago in Spain by the genius of Cervantes, have been only accentuated by the talent of an eminent French poet and by the consummate artists of the Comédie Française, especially MM. Louis Leloir and André Brunot, who took the parts of Don Quixote and Sancho Panza, respectively. M. Richepin's text is brilliant in its incisive vivacity. The dialogue is always spirited, as should be the case with such a subject; it is full of a Figaro-like dash and touch-and-go, which seems to belong more than elsewhere in the land of mantillas and castanets; indeed, the drama fairly breathes the atmosphere of Spain. written in verse, but the rhyme rarely obtrudes unspontaneously; for the most part its jingle is graceful and appropriate. We would not part with it any more than we would with the rhyming in M. Rostand's "Cyrano." (Eugène Fasquelle, Editeur, Paris, France.)

Edvard Grieg With Mr. Henry Theophilus Finck, the author of this biography of Grieg, everything is either black or white. There is no gray in all the world. Liszt? What a god! Brahms? A dry old pedant! The white is what he personally likes; the black what he personally likes. Of course his hero in this volume is glaringly white. His admiration for him is unbounded. The reader must be prepared to be indulgent, to supply the grain of salt. Of course Grieg may fairly be called a genius of high order. His music is more

than tuneful and individual. But let us beware of suggesting it has fleck or flaw; we shall have Mr. Finck at our heels. In spite of this attitude of fierce worshiper, Mr. Finck has written a very readable as well as useful book. He has succeeded, in the first place, in filling it with personality. He quotes letters and chatty reminiscences. He relates anecdotes. He writes sympathetically of Grieg's ambitions and experiences. He has, in the second place, brought together much information about Grieg, some old and some new, which has not before been easily accessible. In spite of its amusing mixture of gush, abusiveness, and dogmatism, this is a book which people will read to their advantage and entertainment, and which is worth putting upon the library shelf. (The John Lane Company, New York. \$1, net.)

The sensational and voluminous Frenzied articles which Mr. Thomas W. Finance Lawson has been contributing to "Everybody's Magazine" have now been published in book form. We see no reason to revise our judgment of these papers and their author expressed while they were appearing periodically. The book has no literary merit, and contains little to convince the intelligent reader that the author's testimony may be accepted without careful corroboration. Mr. Lawson has been a market manipulator and stock-jobber of the most pronounced type, according to his own -jaunty confession. His demeanor on the mourner's bench and his apostrophe to penitence are not of such a character as to give assurance that his conversion is a very profound one. We may forgive him for his confessed participation in what he calls "the crime of the Amalgamated," but for ourselves we prefer to trust somebody else's advice as to where and how to invest our savings and as to the methods and principles we shall adopt in reforming the very actual and widespread evils of corporate greed, overcapitalization, unscrupulous speculation, and the unjust use of public property for private gain. (The Ridgway-Thayer Company, New York. \$1.50.)

The purpose and spirit of six institutions in the South in which negroes are educated are here described. Three of these institutions—Howard and Atlanta Universities and Tuskegee Institute (erroneously called "Tuskegee University" in the runing titles)—are described by colored men, Professor Keller Miller, Professor W. B. Du Bois, and Professor R. C. Bruce: and the other three—Hampton, Berea, and Fisk—by white men, Dr. Frissell, President Frost, and

President Merrill. Professor Miller furnishes the opening chapter and undertakes to provide the background. Unhappily, it is a background of antagonism, not to say animosity, to the white people. Unhappily, also, in this chapter and in that describing Atlanta University, explanation of college training for negroes involves slurs upon industrial training. We should advise most readers of this volume to begin with the chapter on Hampton Institute by Dr. Frissell. The education of the negro has entailed an expenditure of effort and of life that has sometimes been termed wasteful; but, as in education under other conditions, this expenditure, when directed by intelligence as well as faith, has ample justification. This book contains evidence that this is so. The chapters were originally delivered in the Old South Lectures on the History and Work of Southern Institutions for the Education of the Negro. Mr. Robert C. Ogden writes an introduction. (The American Unitarian Association, Boston. \$1.10, net.)

Ground Arms This romance of European war by the Baroness von Suttner has been compared to "Uncle Tom's Cabin" in its influence upon the public sentiment of the country in which it was written. Six editions have already been published. It is a powerful human document in its portrayal of the direct and the incidental horrors of war, and the arguments which are presented, in conversation and reflections, in favor of the settlement of disputes between nations by an international court. The story itself is of keen interest, but the argument is stronger than the story. The author has been awarded the Nobel Peace Prize of \$40,000 in acknowledgment of the book's influence in bringing about the Hague Tribunal. (A. C. McClurg & Co., Chicago. \$1.50.)

Wagner's music-A Guide to the Ring dramas may be enof the Nibelang joyed without commentary, but they will unquestionably be more intelligently enjoyed after some understanding of their structure. This handbook, by the well-known writer of musical criticism, Richard Aldrich, presents concisely and intelligibly an account of the sources of Wagner's four works, "The Rhinegold," "The Valkyrie," "Siegfried," and "The Dusk of the Gods" (Götterdämmerung), an explanation of Wagner's purpose in composing them, and an analysis of each in order. The leading motives are given in musical notation. For general use this guide is most convenient. (The Oliver Ditson Company, Boston. \$1.25.)

Historic Styles in Furniture

The title indicates the special point of view of this new furniture book." Sometimes the century made the style, as in the fifteenth century; sometimes the period, as with the Italian Renaissance; sometimes the monarch, as with Louis XV. Taking each style as a chapter division, the author, Virginia Robie, writes clearly of its development, highest type, and merger into other styles. The illustrations are admirably chosen and well printed. (Herbert S. Stone, Chicago.)

Just what is included Borderland of Wales in this large and com-In the March and prehensive volume is explained by its author, Mr. A. G. Bradley, when he tells us that the term " marches," originally meaning that land of one country which "marched" with that of another-that is, was adjacent to the boundary-long since in Wales was extended to include those slices of Welsh territory conquered soon after the Conquest by Norman barons and held by them independently of the Crown, or nearly so. Many of these spots are of historical as well as picturesque interest, and the plan allows the inclusion of many remote and rugged castles and strongholds. There are scores of line drawings, and these sketches aptly illustrate the text. For the average American reader the treatment is sometimes over-minute and leisurely. (Houghton, Mifflin & Co., Boston. \$3, net.)

In the Sixties This is the title of a pleasing volume of personal impresand Seventies sions of literary and social people of note by Laura Hain Friswell. The author is the daughter of an English essayist and novelist who had agreeable and friendly relations with Thackeray, Cruikshank, Thomas Cooper the Chartist, Kingsley, and other noted men of his generation, while Miss Friswell has many anecdotes of her own acquaintance, Sir Walter Besant, his collaborator, Mr. J. S. Rice, Sir Henry Stanley, William Black, and many writers of our own day. The book is cheerful reading, and, while it is occasionally trivial, is in the main a good specimen of a class of books which entertain one's leisure hours in a most satisfactory way. The volume is noteworthy physically for its novel and handsome binding. (H. B. Turner & Co., Boston.)

Lettres d'un
Curé de Campagne

was "couronné" by the French Academy—
that imprimatur eagerly sought by every
writer in France. In a series of letters written in simple, clear, incisive style, M. Yves

le Querdec, as a supposed French priest, describes his hopes and deceptions, his projects and waverings, his successes and failures. The book appears, appropriately, at a time of special searching of hearts both by churchmen and statesmen in France. The recital of the life of a curé there (and the village priest has always been a peculiarly social as well as religious power in every village) should have its due effect in giving to readers, and especially to foreign readers, a more intimate knowledge of actual, present-day conditions, as affected by recent legislation, which has now culminated in a law practically separating Church and State. As may be fancied, these "Lettres" are written frankly from the Roman Catholic standpoint. (Victor Lecoffre, Paris, France.)

Life and Religion

Religio

Moods of the Wood

A collection of verses that show the author (Ralcy Husted Bell) in command of a sufficiently varied vocabulary to express his sentiments, ranging from patriotic addresses to our country, through appreciation of friends, to impassioned love songs. An impression is left upon the mind that prudent pruning would have made the volume smaller and saved the reader from occasional commonplaces both in thought and phrase. (Small, Maynard & Co., Boston.)

"We no more understand the New Egypt Egyptians than we understand the Japanese; and, besides, there is this difference-that whereas the latter understand themselves, the former do not." So remarked a diplomatist to Mr. A. B. de Guerville, the author of a vivacious, well-translated description of "New Egypt." Of course "New Egypt" includes the Sudan, and this part of the book is of somewhat greater interest to the student of present-day civilization than is the author's entertaining but rather gossiping description of Cairo and the Lower Nile. As M. de Guerville says, "Was there ever a campaign which relatively cost so little and has brought so much as that of England in Egypt?" Seven years ago the situation in

the Sudan was especially discouraging; the country was practically ruined, three-quarters of the population had perished, and those remaining, still quivering under the crisis through which they had been passing, were actively hostile to their conquerors. Yet these conquerors were able to re-establish order, rebuild Khartûm (the capital), organize law courts and a police system, abolish slavery, regulate commerce, found schools, watch over sanitary affairs, especially struggling against the epidemics from which the country had long suffered. Above and beyond all, the conquerors convinced the halfsavage Sudanese that these things were for their good. Not only are the natives now content, but the resources of the country have been developed with unexpected rapidity. In 1898, as M. de Guerville shows, the Sudan produced a value of \$175,000; in 1902, \$2,700,000. Of perhaps equal importance is the description of the Nile in the Fashoda region. It must be pleasant reading to Englishmen to have the testimony of a French author that the mission sent out by France quickly lost its reason-of-being as far as taking possession of Fashoda was concerned. For "it was perfectly certain that, after the enormous effort which England had just caused Egypt to make in order to reconquer the Sudan, . . . she would never abandon the fruits of her victory." Despite occasional blemishes, the book is worth reading. The text is reinforced by nearly two hundred interesting illustrations. (E. P. Dutton & Co., New York. \$3, net.)

Pattie's Personal Narrative James O. Pattie was a Kentuckian of an adventurous turn of

mind who for six years conducted an expedition westward from St. Louis toward the Pacific and back through the City of Mexico to Vera Cruz, arriving in Cincinnati in 1830 penniless and broken in health from imprisonment and ill-treatment in Mexico. His story is entitled to a place in Dr. Thwaite's valuable collection of "Early Western Travels," both because of its thrilling interest as a record of hardship, captivity, and adventure, and because it gives a decidedly interesting picture of Spanish-American civilization in the Southwest and of Anglo-Saxon pioneering and frontier life. (The Arthur H. Clark Company, Cleveland. \$4.)

A Short History of Germany

Short History of Germany

Short History of Germany "—but the "Short History" was in two good-sized volumes. For the sake of those readers who are attracted first of all by brevity, we are glad

to chronicle the appearance of this valuable work in a one-volume edition. Those who are really interested in German history, however, will not be satisfied with such a condensation, admirably as it has been done. Nor will they be satisfied with the excellent two-volume edition as marking the final limit of their study. For perhaps the chief merit of Dr. Henderson's work is also the merit of every other work of art—suggestiveness. (The Macmillan Co., New York. \$2.50, net.)

Baffling as the philos-The True Doctrine ophy of prayer may be, of Prayer the precept of the highest spiritual authority supplies prayer with sufficient reason. To follow the wise is the wisdom of the unwise. In stating the Biblical doctrine of prayer Dr. Leander Chamberlain, President of the Evangelical Alliance in the United States, presents the Lord's Prayer as both the authority and the pattern for all true prayer. With his inference that no one can "truly" and "really" pray unless in full accord with Christ's desire, "Thy will be done," one must so far agree as to say that only such fulfill the ideal of prayer. But short of this a large margin must be recognized, in which prayer concentrating all the energy of a perhaps dimly enlightened soul is, though not ideal, yet a real force, hardly to be deemed utterly ineffective. We may rationally hold with Dr. Chamberlain to an objective efficiency of prayer, and that the universe has been pre-adapted to the exercise of man's natural instinct to pray, though we can hardly adopt his hyperbolical conception "that when true prayer lifts even its feeblest cry, . . . gravitation, cohesion, chemical affinity take notice, . . . that the globe, the planets, the starry systems, turn thitherward their quick attention." Chamberlain's paragraphing of his argument in an aphoristic form is well adapted to secure distinct attention to the successive considerations in which it is presented. The Biblical ideal of prayer and the failures of Christian practice to realize it need all the emphasis here put upon each. (The Baker

Who's Who in America

The new edition of this constantly useful handbook for 1906-7 is greatly enlarged as to the number of biographical sketches contained, and it has been made possible to include these without unduly increasing the size of the volume by the use of paper which from every other point of view is deplorably thin. A new and welcome feature is the

& Taylor Company, New York. \$1, net.)

printing in special type of names included in former volumes but dropped because of death or otherwise; these entries have a reference to the volume in which the lifesketch appeared. The present volume contains, apart from cross-references, brief biographies of 16,216 men and women. The editor, Mr. John W. Leonard, in a preface and in an introduction dealing with educational and social statistics, gives much interesting information, and throws light on such questions as the relative success in life of college and non-college men and the average age of men who have attained success. It could not be expected in a compilation dealing with 16,000 persons that there could be a very well defined standard of admission. but the practical value of the work is really largely due to the extent of its field, and the editor has carefully guarded against the possibility of charges of unfairness or favoritism. The book is not a collection of laudatory or effusive sketches, but is closely confined to a condensed statement of fact. It is really indispensable in a newspaper office, and is of general utility for the public at large in countless ways. (A. N. Marquis & Co., Chicago. \$3.50.)

Men who wish A Young Man's Religion think for and His Father's Faith themselves, and who find the results of modern scholarship unavoidable, can neither define their religion in terms current a generation ago, nor discover in themselves those peculiar experiences which by their fathers were regarded as necessary evidence of religious faith. There are many men, young and old, who are perplexed by this fact. Dr. N. McGee Waters has written this book in order, evidently, to persuade such men that faith does not stand or fall by definitions or even by peculiar experiences. He has a sympathetic understanding of both the older and the newer point of view; and yet he profoundly believes that faith has never found so full an expression as it has found in the terms of to-day, that God was never so well known as he is through the channel of modern knowledge, and that the Bible never appeared so great as present-day scholarship shows that it is. This book, written with the eloquence of the man who is speaking instead of writing, will unquestionably help many readers over perplexities that now stand in the way of a practical application of religion to life. (Thomas Y. Crowell & Co., New York. 90c.,

Letters to The Outlook

THE RECOVERY OF FAITH

[In the multitude of counselors there is wisdom. As there are many causes for the loss of faith, so there are many methods for its recovery. None of these answers is complete or will meet all cases. Neither will the answer given in the editorial in The Outlook of February 10 meet all cases. But in each of these answers some one may find help, and in them all many may find interest.—The Editors.]

The article entitled "The Recovery of Faith," in The Outlook for February 10, which begins by quoting a letter from one who deplores the loss of his boyhood faith, it seems to me does not deal with the subject quite fully or fairly. Is not the loss a sadder and a deeper one than your article would seem to imply? That which makes the child-faith so beautiful is the simple, unquestioning acceptance of the great fact of the Fatherhood of a Personal God, whose great love is most perfectly revealed in the Person of his Son Jesus Christ, who is the Friend and Saviour of all those who put their trust in him and obey him. For such a faith as this the heart cries out not less in mature life or old age than in childhood, and the loss of it is one compared with which all other losses are as nothing. And this faith can be retained. It was in the joy of this faith that Mr. Drummond endured serenely the years of illness that preceded the close of his life. It was in the inspiration of this faith that Tennyson, after the trials innumerable of a long and busy life, wrote before he died,

> "I hope to see my Pilot face to face When I have crossed the bar."

It was this faith that was the keynote of the hymn of the Dean of Canterbury, "Life's Answer," which ends,

"Safe to the land, safe to the land,
The end is this,
And then go with Him hand in hand
Far into bliss."

It was in the strength of this faith that Phillips Brooks wrote:

The Christ who in eternity opens the last concealment and lays his comfort and life close to the deepest needs of the poor, needy human heart is the same Christ that first laid hands upon the blind eyes and made them see the sky and flowers.

When St. Paul says, "When I became a man, I put away childish things," he does not mean that the childlike faith is incompatible with the maturity of mind that belongs to manhood and womanhood. The man of

fifty loves his mother with a deeper reverence and veneration than the heart of childhood can know, but it is the child love still in the heart of the man who gives it. It included the learned ones of His day as well as His disciples when our Lord said to them, "Except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven."

This is a faith worth having and keepingworth fighting for, if need be, and, if lost, it is worth while to lose all else in order that it may be gained again. Is not its loss most frequently due to the fact that even in childhood there is some conscious or unconscious neglect of duty, some failure to struggle with besetting sin, in which case, as one grows older, the intellectual assent to belief becomes a form, with no vital-relation to the life, and the emotional pleasure which church-going may afford will gradually cease because it does not find its rightful end in obedience. As Mr. Drummond says, "religion without emotion is religion without reflection." But religious emotion which does not find its legitimate end in repentance and obedience, or indulged in while the will or any portion of it is consciously unsurrendered, becomes a snare rather than a blessing to its possessor.

The Christian life for its maintenance requires a constant struggle with sin and temptation, and implicit obedience to the great Captain of our salvation. Does one find his faith slipping from him, or is it apparently entirely gone? Let him, with all his might, set about righting whatever may be wrong in his life. Is there an outward or inward sin to be relinquished? Let it be given up now.

Some sacrifices are not easy to make, and of some duty that is required of us the heart of man, if it is honest, may cry out, "I cannot" or "I will not," and then those who have wandered far through sin remember that it is the one way back, and as we try the strength is given, for God loves to welcome back his children, and those who, amid whatever discouragements and trials, keep up the struggle from day to day may rest confident that by and by, if not here, hereafter, the lost joy will be restored and the lost faith found again.

A READER OF THE OUTLOOK.

I have read the article on "The Recovery of Faith" with much interest. But on concluding I could but say, And yet Jesus said, "Except ye be converted, and become as little children, ye cannot enter into the king-

Digitized by Google

dom of heaven." Did you not take a misstep, and at the same time give a stone to a human soul hungering for bread? The faith of the devout heart at seventy-seven does not materially differ from that of the child of twelve, save that, while more intelligent, it is also deeper, stronger, more full of trust, love, joy.

N. J. M.

Please allow me to call attention to a very common error, as expressed in a letter printed under the title "The Recovery of Faith;" namely, the continuance by a mature mind of the method of belief necessary in childhood. The heart does not grow old. one sense, and that a true one, the man is always the boy. The error to which I am referring is that of the author of the letter referred to, who did not obey the injunction of Paul when he said, "When I became a man, I put away childish things." On the contrary, he accepted orthodox teachings when a child, necessarily. After arriving at mature and more thoughtful years, he still continues to accept the teachings of others, namely, those of the scientist and of infidels. He attempts, and poorly succeeds, to be a boy after having become a man.

The lesson here pointed is that of the desirability of obedience to that light which guideth every man, but which is too often obscured by the attention being paid to the seeming torchlight of another. A lady approaching Mr. Emerson at the close of a lecture, and thinking to compliment him, said that she agreed with every word he said. That wise man remarked: "Please do not agree with me. I settle nothing. I unsettle everything. I am only an eternal experimenter like yourself."

Much confusion and sorrow and loss of hope and faith is caused by the so general effort of trying to wear second-hand opinions.

"There is no chance and no anarchy in the universe. All is system and gradation. Every god is there sitting in his sphere. The young mortal enters the hall of the firmament; there is he alone with them alone, they pouring on him benedictions and gifts, and beckoning him up to their thrones. On the instant, and incessantly, fall snow-storms of illusions. He fancies himself in a vast crowd which sways this way and that, and whose movements and doings he must obey; he fancies himself poor, orphaned, insignificant. The mad crowd drives hither, thither, now furiously commanding this thing to be done, now that. What is he that he should resist their will, and think or act for himself? Every moment new changes and new showers of deceptions to baffle and distract him.

And when, by and by, for an instant, the air clears and the clouds lift a little, there are the gods still sitting around him on their thrones—they alone with him alone."

"He that hath ears to hear, let him hear."

I. C. C.

You appear to take for granted and give out the idea that all mankind must of necessity pass through these successive stages of erroneous childhood belief, then analysis and doubt, and with perhaps a rare chance of again emerging into the realization of the omnipresence of God. The letter you are answering portrays, as you say, "a common experience;" but, while deploring the condition, why not find the solution of the difficulty in the truthful education of children? "Whosoever shall not receive the kingdom of God as a little child, he shall not enter therein," are the words of the Christ. Cannot a child understand a measure of truth? Then why teach children grotesque dreams of heaven and an anthropomorphic God which cannot stand the test of reason? "Life will undeceive him," you say. To me that is inexpressibly pathetic; yet you omit any suggestion of regret that your inquirer did not, when a boy, comprehend as a child might that the unchanging God is Love. Your line of demarcation is so strong between "childhood faith" and the faith of manhood, yet it must be the same faith differently expressed. Nothing should be lost; nothing of good is lost. Burns's "John Anderson's" wife was not grieving over the loss of the rapture of youthful love; it was not lost, but out of it had grown the greater love. I used heartily to despise Emerson's essay on Love, where he speaks of youthful passion, the endearments, the avowals, as "deciduous," having a prospective end, until I learned this truth that nothing is really lost; and this is beautifully illustrated in Olive Schreiner's Dream, The Lost Joy: when Life and Love lost their first radiant Joy, they would not give up to reclaim it that dearer being, Sympathy, the Perfect Love.

Through childlike—not childish—acceptance of good will the despondent one come into "the kingdom" he fancies was childhood's possession and lost.

E. L.

In that most interesting editorial, "The Recovery of Faith," the core of your brotherly advice to the letter-writer lies in the last paragraph. In the very conciseness of the three sentences so full of meaning there may be danger that one who is genuine in distress and desire may fail of the doorway to inexpressible delight. It is more for him,

therefore, than to you or to your readers that these lines are written. If they may meet his eye, it matters little whether any other see them. The kernel of the whole matter, I take it, lies in the sentence: "He will best find his way to a real, manly faith by mingling in literature and in life with men of faith, and by always being obedient to such heavenly vision as is afforded to him." Yet it seems to me that there is one omission, a suppressed thought, probably to your mind to be regarded as necessarily involved in the sentence, but possibly not in the least luminous to your inquirer. To prevent his losing this thought is the object of the present writing. In many another parallel instance it has appeared that all that was needed to bring the genuine man to the joy of an assured faith was a frank, definite appeal to the far-off God for leading and light, coupled with a promise to follow wherever the light might lead. This done, in unnumbered cases, the seeker after God was speedily assured of his Perpetual Presence even before any possible association with men of faith. If your correspondent will make such a conscious, purposed appeal for guidance, and accept your advice to mingle with men of faith, and especially to follow the heavenly vision as speaking in the Book which already he accepts as the Word of God, it is a blessed certainty that light will arise for him, for even to-day it is true that God is a rewarder of them that diligently seek him.

Asterisk's letter on "The Recovery of Faith," in The Outlook of February 10, appeals to me with peculiar force, having had, to a degree, a similar experience. It seems to me that the writer is making the same mistake that I did, viz., making faith in Christ a matter of the intellect alone. Let me pass on a faithful pastor's advice: "Never mind your head, but make sure your heart is right." "For with the heart man believeth unto righteousness" (Romans x. 10); "The Lord is my strength and my shield; my heart trusted in him, and I am helped" (Psalm xxviii. 7); "Be not slow of heart to believe;" to that end, the Word

must be "hid in the heart" (Psalm cxix. 11). The writer of that letter will "best find his way to a real, a manly faith," not merely "by mingling in literature and in life with men of faith," but by looking constantly to God for guidance and help in accordance with the promise, Draw nigh unto God and he will draw nigh unto thee—not depending on faeling to prompt earnest prayer, nor allowing coldness of heart to discourage. When Christ is in the heart, it will glow with love and joy, such love and joy as he alone can inspire. Then, indeed, true obedience to the heavenly vision will follow; or, what is equally true, the vision will follow obedience.

THE GILBERT MEMORIAL

At the time of the death of the late Mrs. G. H. Gilbert, which occurred in December, 1904, The Outlook printed an appreciation of her personality and of her achievementsas an actress, commending "her art, her skill, and her personal charm, which her age only ripened and beautified." She was a member for many years of the Bloomingdale Reformed Church of New York City, which has recently built a new edifice on West End Avenue, in the upper part of the city. It is now proposed to place a stained-glass window in this new church building as a token of affection and honor to the memory of Mrs. Gilbert, "whose virtues," as the committee in charge most appropriately say, "reflected honor upon the church and stage." This committee, which is composed of the pastor of the church, the Rev. Dr. Stinson, and Mr. Daniel Frohman, Mr. John Drew. Miss Maude Adams, and others, is undertaking to raise the necessary funds for this memorial. If each one of those whom Mrs. Gilbert entertained and charmed nightly for so many years will make even a modest contribution to the fund, success is assured. Contributions may be sent to Mr. Reed Moore, President of the New Amsterdam Bank, Broadway and Thirty-ninth Street, or Mr. Daniel Frohman, Lyceum Theater, West Forty-fifth Street, New York.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

Be Fair to Your Skin, and it will be Fair to You—and to Others

A Beautiful Skin can only be secured through Nature's work. Ghastly, horrid imitations of Beauty are made by cosmetics, balms, powders, and other injurious compounds. They put a coat over the already clogged pores of the skin, and double the injury.

Now that the use of cosmetics is being inveighed against from the very pulpits, the importance of a pure soap becomes apparent. The constant use of HAND SAPOLIO produces so fresh and rejuvenated a condition of the skin that all incentive to the use of cosmetics is lacking.

HAND SAPOLIO

SO PURE that it can be freely used on a new-born baby.

SO SIMPLE that it can be a part of the invalid's supply with beneficial results.

SO EFFICACIOUS as to bring the small boy almost into a state of "surgical cleanliness" and keep him there.

BANKING

ESTABLISHED

The strength of a financial institution should be gauged by its capital and surplus, which in our case amount to Six Million Dollars.

From a small beginning in 1868 the deposits of this institution have steadily grown until our assets now amount to over Fortytwo Million Dollars. Send to-day for our booklet "V" describing our system of handling savings accounts of \$1.00 and upwards by mail, sent free on request.

An Indefensible
Vote

The Senate Committee,
by a vote of seven to
six, has refused to report to the Senate, even without recommendation, the bill reducing the tariff on
imports from the Philippine Islands.
That is, the Committee not only refuses

That is, the Committee not only refuses to give any relief to the Filipinos by opening to them, as subjects of the United States, the markets of the United States, but it refuses to allow the question whether they shall have such relief to be discussed in the open sessions of the Senate. The obstructive character of the Senate has had no more dramatic illustration lately than this action. The justice of this bill is so apparent to the Administration that it has been earnestly urged by the President, and we believe by all his Cabinet; and so apparent to the people that it passed the House of Representatives by the non-partisan vote of 258 to 71; and yet a Committee of the Senate refuses to allow the Senate to For the Committee refused consider it. to report the bill, even adversely. votes against the proposition to put the bill before the Senate for consideration but without recommendation were those of Messrs. Hale, Burrows, Dick, and Brandegee, Republicans, and Messrs. Culberson, Du Bois, and Stone, Democrats. We hope that the local press will report the facts to their constituents, and that those constituents of these Senators who believe that the honor of the country is involved in giving our Filipino subjects a fair chance for industrial life will send their protests to the Senators who have misrepresented them. The only argument a Republican can make to justify this action is that the tariff is so fragile a house of cards that a discussion of any aspect of it may bring it tumbling down. What argument a Democrat can make to justify the action our imagination is not adequate to conceive. We believe that Senator Lodge, who has the bill in charge, can move to discharge the Committee from further consideration of the bill. Precedents are said to be against such a course; but fair play is worth more than precedents, and we hope that Mr. Lodge will make the motion and give the Senate a chance to put itself on record and the country a chance to see how its Senators stand on a question so vital to our commercial interests in the East and to our honor in the civilized world.

•

Senator Foraker on Railway Rate Regulation Senators rarely pay one of their number the compliment of a full house. They did

so, however, last week to Senator Foraker, of Ohio, the galleries also being crowded, and gave close attention to a much-heralded speech from perhaps the most conservative opponent of railway rate regulation as intrusted to the Inter-State Commerce Commission. Foraker conceded that some railway evils exist; they were (1) excessive rates, (2) rebates, (3) discriminations. Under the first heading he found little to complain of; rebating, he said, was a more serious evil, and Mr. Foraker naturally traced the present railway consolidations to the fact that the Supreme Court decisions against pooling had left the railways without protection from rebates except to resort to some general understanding (like that, we suppose, upheld on the following day by the Supreme Court itself). As to discriminations, the speaker declared the power of the Elkins law to be as broad in remedying discriminations as to localities as it has been found to be in remedying discriminations as to persons. Though the Supreme Court has never passed on the question of the right of Congress to make rates, he

Digitized by Google

believed that it would decide adversely; and such a decision would be fatal to the entire scheme of railway rate legislation now before Congress.

3

An Estimate of his Argument aker's most fundamental his Argument contention, that the Supreme Court would hold the railway rate regulation bill to be unconstitutional on the ground that Congress has no power to regulate railway rates, The Outlook has simply to say that if it should so hold it would run counter, if not to its previous decisions, certainly to the trend of those decisions. For the Supreme Court has held that a State Legislature has power to regulate rates within the State, and it has also held that the Federal Government has all the powers over inter-State commerce which any sovereign nation can have over its railways, subject only to the express or necessary implied limitations imposed by the Constitution itself. It is difficult, in the light of these decisions, to see how it is probable that the Supreme Court would deny to the Federal Government the authority over inter-State commerce which it has declared is possessed by the State over State commerce. We think Congress has a right, in the light of these decisions, to assume the Constitutional power of the legislative body to enact that railway rates shall be just and reasonable, to define in general terms, as the pending bill does, what are just and reasonable rates, and to leave to the administrative department of the Government the application of these general principles to individual cases as they may arise. We certainly agree with Senator Dolliver, of Iowa, who in his reply to Senator Foraker declared it to be most important to know what power Congress had in regard to rate-making, and urged the passage of the pending measure for that purpose if for no other. The other question raised by Senator Foraker is more difficult; it is at least doubtful whether under the Constitution any department of the Government has a right to allow more favored rates to one port than to another, which is now done by the railways upon the plea that this is necessary to secure a

distribution of the traffic and a consequent distribution of the prosperity which that traffic brings. But if it is unconstitutional for any department of the Government in its railway rate regulation to allow such differentials, it is at least questionable whether it is Constitutional for the Government to allow them to be made by the private corporations into whose hands have been intrusted the administration of the National highways. Certainly, if the traffic is to be distributed by artificial methods, such as discriminations in rates between different ports, such discrimination should be made by an organization which represents all the people of the United States rather than by one which represents special interests and special localities. Under any circumstances, said Mr. Foraker, the attempt to confer upon a body asserted to be administrative in character all three powers of the Governmentlegislative, judicial, and executive-"would be alarming if its utter unconstitutionality were not as apparent as its unreasonableness."

It involves the general supervision by a political board, appointed by the President, of a business so tremendous as to be practically incomprehensible, and so complicated and difficult in its character as to be almost beyond the power of human intellect to master it, with authority to change rates with the stroke of a pen, affecting revenues to the extent of millions of dollars, and to make new regulations of every character affecting the operation of more than 200,000 miles of railways, and affecting also, because of their relations to the railroads and their dependence upon them, almost every other kind of important business conducted throughout the length and breadth of the country; and in this behalf this board, to the judgment of which these vast interests are to be subjected, is authorized to be legislator, prosecutor, judge, jury, and marshal all combined.

If, however, Congress has the power to fix rates, Mr. Foraker would still oppose any bill which would overturn the practice of granting differentials on export traffic, although he apparently admitted that the differential system violates the Constitutional provision prohibiting a preference in favor of the ports of one State over those of another State. Citing the differentials allowed, he declared them to be essential to the diffusion of the export traffic, yet they conflict with one

of the purposes of those seeking the proposed legislation, which is to secure to each locality its own particular rightful advantages of location. Mr. Foraker then proclaimed the necessity of a more specific court review provision, in which contention many opposed to him on other grounds will agree.

There are two prin-Amendments to cipal grounds for a the Hepburn Bill judicial review, when properly challenged, of the Inter-State Commerce Commission's action: (1) the charge that the Inter State Commerce Commission has exceeded its Constitutional authority in making a rate that is wholly or partly confiscatory, thus invading the Constitutional rights of the appellant; (2) that it has misinterpreted and misapplied the law to the facts in the case before it. The chief question at issue between the radicals and conservatives is whether provision for appeal in the second class of cases shall be made in the bill. A second amendment which many Senators would like to see incorporated would eliminate the thirtyday provision regarding the effectiveness of the Commission's rate. A court might hold that thirty days was not a reasonable time, and a general policy might be inaugurated through the courts of staying all rates ordered by the Commission on the ground that the time allowed was too short. Moreover, a Commission competent to fix a maximum rate should be equally competent to determine the time when it shall go into Thirdly, there is a strong movement in the line of the amendatory bill introduced by Senator Knox, of Pennsylvania, providing that when a stay has been granted a deposit or bond be given by the railways to pay the difference between the new Commission's rate and the one previously in force; a greater agreement among Congressmen, we believe, could be obtained for a provision requiring cash payment instead of a bond. The cash payment might have the virtue of acting as an additional deterrent. Senator Clay, of Georgia, has proposed an amendment prohibiting railways from dealing in coal, coke, or oil, and also

prohibiting railway ownership of such

properties except for supplying the railway's own needs. Railway officers are likewise forbidden to deal in or own such commodities or lands. Such an amendment would seem to meet Senator Foraker's criticism that the Hepburn Bill does not profess to prevent carriers from engaging in other kinds of business. Senator Elkins, of West Virginia, has also offered an amendment providing that coal-carrying railways shall not compete in the production and sale of commodities hauled over their own lines by private shippers. If these two latter amendments be made law, they might form a separate enactment.

☻

Within a week of its im-Pooling versus portant decision in the Rebating Chesapeake and Ohiocase the United States Supreme Court has handed down another decision of great moment to railway interests. If the effect of the first decision will be to restrict those interests, the effect of the second may be to expand them. 1899 all the railways of Southern California fixed a through rate of \$1.25 per one hundred pounds on oranges from Southern California points to the Missouri River and further east. In this rule the railways reserved the right of routing (or choosing the route for) the freight east of their own terminals. The California Citrus Fruit Growers' Association complained that a pooling agreement existed among the railways leading to the Atlantic seaboard under which the fruit traffic was apportioned and by which joint rates for all were fixed, and that in pursuance thereof, as shippers were not allowed to name the railways over which the fruit should pass, it was sometimes sent by roundabout routes, resulting in delay and loss. The railways declined to obey the Inter-State Commerce Commission's consequent order to cease compulsory routing. Thereupon the case was carried to the Circuit Court on the ground, as the Commission contended, that rate and traffic agreements were virtually pooling contracts, and as such in violation of the anti-pooling provisions of the Inter-State Commerce Law. railway companies justified the routing

requirement by declaring it necessary to prevent rebates and favoritism. Circuit Court sustained the Commission's contention. The case was then appealed to the Supreme Court, which now reverses the Circuit Court's decision and also the Commission's order, because it does not find that there has been, as a result of the rule, any discrimination between the initial carrier and the shippers; that an initial carrier might agree upon joint through rates with one or several connecting carriers, in which case it guaranteed a through rate, but only on condition that it had the routing; that the payment of rebates was unsatisfactory to all the railways, besides being plainly a violation of the Inter-State Commerce Act; that the routing arrangement was established to break up rebating; that it had been accomplished; that the traffic was fairly apportioned among the Eastern railways and that it went by the shortest routes; that not one of those railways knew the percentage of the traffic which it received: and, finally, that the tonnage pool was a myth. The Supreme Court's decision does three things: (1) It defines legal pooling; (2) it gives a more liberal construction to the law as applied to joint traffic arrangements; (3) it sanctions the modern practice of joint tariffs as a lesser evil than discrimination and favoritism. Thus it tends in the direction of the principle for which The Outlook has long contended, that the remedy for injustice in railway rates is not prohibition of combination, but regulation of the rates by the Government.

ക

The Secretary of State Congo and the has written an open letter United States explaining the reason why the United States cannot officially interfere or even protest against the terrible wrongs inflicted upon the people of the Congo. How terrible those wrongs are our readers have been told. strongly as we wish that something could be done by America to put a stop to these cruelties, we are quite sure that the Secretary of State is correct in his conclusions. Our Government has no official responsibility for the Congo State. It has no means for conducting an inde-

pendent investigation into the conditions there. There is no more reason why it should co-operate with other Powers in a protest against those conditions than why it should have united with them in a movement for the protection of the Christian subjects of Turkey at the time of the assassinations. But while the Nation cannot act officially, the people of the Nation can act unofficially through public appeals and public meetings. For this purpose no new investigation is necessary. The report of the Commission appointed by the King of the Belgians, of which we have given our readers some account, furnishes an entirely adequate basis for such popular protest. defense put forth by the King of the Belgians furnishes all the grounds necessary for his conviction. We are not certain that Congress might not by joint resolution express the public sentiment of the American people on this subject. The refusal of Congress to pass a resolution on behalf of Greece in 1824 is a precedent against Congressional action now, but the historic speech of Daniel Webster in favor of that resolution may perhaps be said to furnish a precedent quite as strong on the other side. emphasis which he put in that speech on the value and effectiveness of public opinion upon nations as well as upon individuals may appropriately be recalled at the present time as an incentive for arousing such public opinion in this country.

The call for a con-President Roosevelt ference of the oper-Intervenes for Peace ators of the central competitive soft-coal territory, embracing western Pennsylvania, Ohio, Indiana, and Illinois, to be held at Indianapolis on March 19, and the reconvening of the National Convention of the United Mine Workers of America in the same city on March 15, are recent developments in the mine labor situation which the public may regard as indicating that a strike of the bituminous coal employees is to be averted through a compromise of the differences between their representatives and their employers. The calling of these respective meetings followed the receipt of letters from President Roose-

velt by Chairman Robbins, of the bitun.inous operators' committee, and President Mitchell, of the mine workers' union. These letters were in substance the same, the one to President Mitchell reading: "I note with very great concern the failure of your late convention on the joint inter-State agreement to come to a basis of settlement of the bituminous mining scale of wages. You in this business have enjoyed a great industrial peace for many years, thanks to the joint trade agreement that has resulted in the action of your successive conventions. A strike such as is threatened on April 1 is a menace to the peace and general welfare of the country. I urge you to make a further effort to avoid such a calamity. You and Mr. Robbins are joint chairmen of the Trade Agreement Committee of the National Civic Federation, and it seems to me that this imposes additional duty upon you both and gives an additional reason why each of you should join in making a further effort." Shortly after the receipt of President Roosevelt's letters it was announced in New York by President Mitchell that the miners' National Convention would be reconvened in Indianapolis on March 15, and from Pittsburg Chairman Robbins made public the call of the operators' committee for their conference in Indianapolis on March 19. In explanation of this action the operators' committee stated that "said meeting has been called entirely in deference to the wishes of the President of the United States, and that no action has been taken or agreement of any kind has been made by any operator up to this date regarding any possible settlement of existing differences. No settlement is possible on any terms until after such meeting has been held and the individual views of all of the operators of the four States have been obtained." Notwithstanding this statement, it is known that prior to the receipt of President Roosevelt's letters representatives of the operators and miners had been making the usual diplomatic moves to bring about a compromise before April 1 between the demands of the mine workers for an increase of twelve and one-half per cent. increase in wages, and the

counter-demand of the operators that the present wage scale, in force since 1904, should be continued. The President's intervention acted as an additional incentive for those representatives to reach an amicable settlement, and it is believed that the coming Indianapolis meetings will result in a reconvening of the Inter-State Joint Conference which adjourned in January without renewing an agreement for the scale year following April 1.

settling the differences between the soft-

coal operators and mine workers is fore-

Texas), and in some six other coal-mining

States having State or district agree-

ments, is also to be expected, as these

separate conferences usually follow in

general the action of the central competi-

tive inter-State conference. This does not affect the wages and conditions of

employment of the 155,000 mine workers

in the anthracite fields of Pennsylvania,

whose interests for the present are in the hands of the conference of hard-coal

operators and mine employees which

met in New York on February 15, but

which has not as yet come to any decision. The status of the negotiations between

Operators and Miners
Likely to Compromise

shadowed in the statement made public at Indianapolis on February 24 by Vice-President Lewis, of the United Mine Workers. In this statement Vice-President Lewis said, among other things: "You may accept one proposition as a fixed fact—that there will be no general strike in the mining industry April 1. The operators will restore the reduction accepted by the miners two years ago, and perhaps more." On this basis the compromise agreement foreshadowed by a reassembling of the operators and mine workers of the central competitive territory will bring to the mine workers of western Pennsylvania, Ohio, Indiana, and Illinois an increase of five and onehalf per cent. over their present wages, this being the percentage of the wage reduction in 1904. A similar increase in wages to the mine workers in the Southwestern territory (Missouri, Kansas, Arkansas, Indian Territory, and

The compromise

plan likely to be

agreed upon in

these representatives of the anthracite employees and operators looking to an agreement as to wages and conditions of employment in that industry following the expiration of the Anthracite Coal Strike Commission's award on March 31 is reflected in the statement that at this writing the demands of the miners are in the hands of the operators. Since the conference on February 15, at which sub-committees of operators and mine workers were selected by each side to carry on negotiations, practically all the intervening time has been consumed by the sub-committee of the mine workers in drawing up their formal demands, and last week it was announced that these had been transmitted to the operators' sub-committee and were being discussed by its members. What these demands are the public has not been informed, and the only means it has had of even conjecturing as to the issues between the two interests engaged in the production side of the hard-coal industry are the inferences to be drawn from the letter of President Willcox, of the Delaware and Hudson Company, in reply to President Mitchell's request for the conference. This is the only letter of all the correspondence between the mine workers' officials and the hard-coal operators the contents of which have become public. Judging from the questions which President Willcox discusses in his letter, the demands of the mine workers upon the operators are for an eight-hour day for specified classes of employees, an increase in wages, recognition of the United Mine Workers of America, and a reorganization of the Anthracite Board of Conciliation. All of the representatives of the anthracite employees through whom the negotiations with the operators are being carried on are officials of the United Mine Workers of America, the significance of this statement being in the fact that, whether the operators "recognize the union" or not, it is that organization, for all practical purposes, with which they are dealing. This being plain, it is not believed that the officials of the miners' union will insist upon formal recognition, and this of course removes one of the strongest obstacles to a satisfactory ending of the present negotia-

tions. In view of these negotiations between the mine workers and operators as to the division between them of the price the consumer is compelled to pay for hard coal, The Outlook regards as pertinent the question, Why is not the consumer of coal represented in a matter of such vital concern to him? The next step in the formation of the industrial State ought to bring with it a satisfactory answer to this question.

Labor Leaders
Charged with Murder

The recent arrest in Denver of the President and Sec-

retary of the Western Federation of Miners on the charge of inciting the murder of ex-Governor Frank Steuenberg, of Idaho, opens a new chapter in the strange and thrilling history of the labor war in the mining States. Governor Steuenberg was slain at the gate of his own home on December 30, 1905. The present Governor of Idaho has issued an official statement in which he says that one Harry Orchard, the actual perpetrator of the murder, has made a full confession as to the manner and motive of the assassination, telling of the plans made and giving the names of those making them. Orchard confesses that this was his third attempt to kill Steuenberg; and it is alleged that he has also told of twenty-six murders growing out of the war between miners and mine-Among those who are implicated by these confessions are President Charles H. Moyer and Secretary W. D. Haywood, of the Western Miners' Federation, and the Idaho authorities declare that they have other evidence of guilt to confirm the confession of Orchard, while Governor Gooding, of Idaho, asserts solemnly that his only object in procuring the extradition of the accused labor leaders from Denver is to secure justice, and that there is no thought of punishing the innocent or waging war on any labor organization. The arrests have created a great sensation in Colorado, Montana, and Idaho, and have caused a revival of the recriminations as to violence, lawlessness, and oppression which marked the miners' war-for it was really little less than war. Among

the acts alleged to have been done by striking miners against non-union men were the intentional derailing of trains, the destruction of fourteen men by dynamite at Independence, the use of infernal machines, and the dropping of a cage with fifteen non-union miners in it down a 1,400-feet shaft. Secretary Haywood has often been accused of inciting violence (he is said to be really a greater power in the unions than President Moyer), but so far legal proof has not been adduced, and the charges have been strenuously denied. We need hardly say that the present accusation of murder is not to be accepted as true, and that until a jury has passed upon the evidence no one has a right to assume that these men are guilty. It may once more be pointed out, however, that the worst enemies of the labor union are those who incite or countenance violence or disregard of law and order. Not only must the non-union laborer be protected to the last point in his personal and civil rights, but the law-abiding union laborer must be protected from the public suspicion and discredit that fall upon him when violence occurs in labor troubles.

In the case of Franklin Legal Liability Union No. 4 vs. The of Incorporated People, referred to in Trades Unions The Outlook of February 10 (page 283), the decision against the Union has been, on appeal, affirmed by the appellate court. In this case the Union was incorporated, and there was evidence showing corporate acts of the Union in violation of the injunction. Whether the evidence was sufficient to make the organization responsible for the illegal acts of individual members was one of the questions in the case, and on this question the court was divided in opinion. The majority of the court say in their opinion: "We think the evidence clear and unequivocal that Franklin Union No. 4 was a party to the conspiracy alleged in the bill to exist, and it was properly found guilty of a violation of the injunction." The minority of the court, on the contrary, say: "That the evidence does not show that Franklin Union No. 4, in its corporate capacity, entered into any combination with any person or persons to do an unlawful act or to do a lawful act by unlawful means, or that the Union did anything in violation of the commands of the writ of injunction." From the imperfect reports of the case before us we do not think that any principle is decided in this case except the principle that when there is adequate evidence that an incorporated trades union—and the same principle would apply to any corporation—is proved to have participated by its corporate acts in illegal conduct, it can be held responsible by the courts and subjected to legal penalty; and in this principle there is, of course, nothing

At the last session of The Price of Gas the New York Legisin New York lature a committee was appointed to investigate the subject of gas and electric lighting in the city of New York. As a result of the report of this committee two bills were introduced in the Legislature, one fixing the maximum price at which gas might be sold to the public at eighty cents per thousand feet, and the other creating a State Commission on Gas and Electricity which was empowered, among other things, to fix the maximum rate which any lighting company in the State might charge. The former bill was defeated by the powerful lobby representing the gas interests, but the latter was passed. A bill was also passed making the price for gas sold to the city for public lighting purposes seventy-five cents per thou-The State Commission, after a sand. long and careful investigation of the conditions in New York City, has filed orders fixing the maximum rate for the borough of Manhattan for the next three years at eighty cents per thousand feet. This price was arrived at by determining the cost of the manufacture and distribution of gas to consumers, and adding to this amount enough to provide for a reasonable return to the company upon the actual value of the property owned by the company and used in the manufacture and distribution of gas. This return was fixed by the Commission at eight per cent. of the

value of the property. In determining the margin of profit which the companies shall be allowed to make, the Commission laid down two important principles: First, the return of eight per cent., which the Commission believes to be reasonable, shall be computed, not upon the capitalization of the company, but upon the actual capital employed in the manufacture and distribution of gas. in determining the amount of this capital, the value of the company's franchise shall not be included. It is contended by the companies that as they are compelled to pay taxes on their franchises, the value of these franchises should be considered in arriving at the amount upon which the companies may properly make a profit. The Commission, on the other hand, believes that these franchises, granted by the people without compensation, should not be capitalized against the public, thereby compelling the public to pay a profit upon the value of the favor granted by it. The franchise tax paid by the corporation is charged against the public as an expense of operation, and is therefore, in reality, paid by the consumer. The order of the Commission fixing the price is subject to review by the court, a provision which will undoubtedly be availed of by the gas companies. A bill fixing the same price, similar to the one defeated last year, has passed the Assembly and is being pushed in the Senate. It should be enacted promptly, for it will reinforce the action of the Commission and make it reasonably certain that the new price will go into effect without delay.

❸

The New York Leg-Removing a islature has passed Dangerous Nuisance the bill requiring the New York Central Railroad to put its freight tracks on Eleventh Avenue in New York City into a subway. These tracks have for years been an obstruction to traffic, often an obstacle to the successful fighting of fire, and always a menace to life and limb. They are a relic of days when Eleventh Avenue was a road running through uninhabited lands on the outskirts of the city, and constitute a valuable object-lesson on

the folly of granting perpetual franchises anywhere in a city. The measure provides that the Rapid Transit Commission shall prepare, in agreement with the railroad company, a plan for a subway under the present tracks, to be built at the expense of the company. In return for a franchise to operate such a subway, the railroad shall surrender all its rights to the street through which it now runs, and shall remove from it all its tracks. The plan and franchise must be approved by the Board of Estimate and Apportionment before they become effective. In case the railroad company refuses to agree upon a plan with the Commission within a year, the Commission is directed to condemn the rights and franchises of the company to operate the road, and to cause the tracks to be removed from the street. It is reported that the counsel for the railroad has notified the city officials that if the bill becomes a law, by the signature of the Mayor and the Governor, it will cost the city a hundred millions of dollars; the company will compel the city to condemn its franchise, and will be able to show that it is entitled to that amount as compensation. The right under which the railroad now uses the avenue is, however, a doubtful one, and if the matter came before the courts it is by no means certain that the company would be found entitled to any compensation.

For many years the So-The Trouble ciety for the Prevention "S. P. C. A." of Cruelty to Animals has been one of the most useful and widely honored philanthropic organizations of New York City. The principles upon which it was established, and its reformatory work, not only in the protection of dumb animals. but in the development of humane and merciful feelings in the community, have made its founder, Henry Bergh, one of the National figures that Ameri-The Society was cans like to honor. established by Mr. Bergh in 1866, in the face of ridicule and skepticism, but when he died in 1888 he had the satisfaction of seeing the Society placed upon a firm and effective basis, and of know-

ing that the laws for the protection of animals which he had been instrumental in enacting had been adopted by forty States in this country as well as in several foreign countries. It is very unfortunate, therefore, that the Society finds itself to-day the target of serious public and private criticism. The charges are that it has grown slack and indifferent in its work, that its management is autocratic and unsympathetic, and that its income, which is a handsome one—for the Society has grown very popular—is mismanaged or unwisely applied. No corporation, least of all a public and benevolent one, can afford to ignore charges of this kind when they attain such volume and are supported by such authority as are found in this case. The President of the Society, Mr. John P. Haines, is openly accused by some of the very best and most public-spirited citizens of New York of making or attempting to make the Society a close corporation in which he shall exercise despotic power. It is charged that he declines to have the accounts audited. and that he "packed" the recent annual meeting of the Society with paid employees so as to vote down a resolution calling for a complete investigation. is impossible for The Outlook to form any judgment upon the facts presented to it as to the charges of inefficiency and financial mismanagement, but it is very clear to us that Mr. Haines is seriously injuring himself as well as the Society by refusing to give the fullest opportunity for a complete and thorough investigation of the charges We have and of the Society's work. had too recent an example of the personal disaster which followed the attempts to "whitewash" some of our great insurance corporations not to see the folly of trying to stifle by strategy the desire of the directors and members to know in fullest detail how the Society does its work. As the Society receives a large income from State or city funds, it is possible that a legislative inquiry may be made. At all events, it is to be hoped that, if Mr. Haines cannot be persuaded to see that he is pursuing a mistaken course, the managers and members will take steps for a reor-

ganization of the Society. Its work is of so fine an order that public interest in it ought not to be chilled nor its successful continuance hampered by public doubt and suspicion of the wisdom, ability, and humane sympathy of its executive head.

Apparently because

Reaction

municipal reform is Against Privilege not progressing rapidly enough, Mr. Joseph M. Patterson last week notified Mayor Dunne, of Chicago, that he resigned immediately as Commissioner of Public Works. His letter of resignation is a document of some importance because it expresses a feeling that is growing in intensity, especially in the Middle West. It is a feeling of dissatisfaction with the law which Mr. Patterson's letter interprets. Mr. Patterson was bred in an environment of conservatism. He is a young man of means, educated, forceful, a natural executive. Following his convictions, he supported Mr. Dunne when, candidate for Mayor, he raised the issue of "immediate" municipal ownership. In turn, Mr. Patterson was made a member of Mayor Dunne's administration, and he proved himself to be most efficient. In spite of his success, however, he has withdrawn in disgust with the conditions he felt constrained to fight. In his letter he cites instances in which he encountered corporations impregnably secured against attack in spite of their thefts of public property. "The whole body of our laws," he writes, "as at present framed, are ridiculous and obsolete. They are designed always to uphold capital at the expense of the community." Legal delay by appeal to the courts he finds to be the effective weapon of corporate wealth. Money, he believes, has become allpowerful. He therefore concludes that "ownership from which money springs should be invested in the whole community." He is not sure that he is a Socialist; but he accepts that label, and withdraws from the municipal government. He thus retires from the active combat against unjust privilege for the sake, apparently, of a party name concerning which he himself is doubtful. Inconsistent as his withdrawal is, his letter is indicative of a condition which is widespread and threatening. Michigan, for instance, is, by its own Constitution, deprived of the power to own, or to allow its cities to own, street railways. Valuable franchises are about to expire in Detroit, but the companies seem to have the city at their mercy. The cumbrous process of amending a constitution and the inclination of courts to make decisions on technical points in favor of existing privileges are thus coming to be popularly regarded as inimical to popular rights. It is not the part of wisdom for either legislatures or courts to disregard this feeling. No one has a right to ask the courts to disregard or set aside the law; but we have a right to ask that they will give to it a free interpretation, and in the interest of the rights of the common people rather than in that of special privileged classes.

@

The violence and rioting Race Riots in of last week in Springfield, Ohio, like the lynching in the same city two years ago, are the outbreaking of a spirit of lawlessness and bad citizenship for which the people of the place as a whole must hold themselves responsible. Race hatred is an evil that may exist anywhere, North as well as South; there are certain districts in New York City, for instance, where the less desirable elements of both races are mingled, and where more than one little race war has broken out more than once—quickly quelled, to be sure, but fierce while it lasted. But a soundly governed municipality will not permanently let such an evil fester. In Springfield the locality of the riots is called the "jungles," and is described as a notorious quarter filled with negro haunts of vice and criminal resorts. The town that lets such an infested "jungle" flourish undisturbed must accept the consequence. The trouble last week began with the shooting by two negroes of two white men. An attempt to seize and lynch the negroes was thwarted, and the mob marched to the negro quarter, wrecked and burned two saloons, cut the hose when the fire department tried

to subdue the flames, chased and assaulted negroes indiscriminately, and brought battering-rams to bear on the wretched "shacks" of the "jungle." The spirit of the mob may be judged from the statement that "the original plan of the mob, according to some of the members, was to get Dean [one of the negroes accused of shooting] out of the jail, pull him at the end of a rope to the railroad yards, tie him to the rails, and let a switch engine run over him.' For three or four days the rioting, burning, and violence continued, and the reports remind one of the descriptions of the Civil War draft riots in New York. The authorities called out eight companies of militia, tried to close the saloons, and broke up by police and soldiers all large gatherings of people. Still there were frequent instances of misconduct and attempts at house-burning, and it was feared that, if one of the white men originally wounded should die, the outbreak might be renewed with increased force. The forces and associations which stand for law and order held meetings to urge a firm stand by the authorities, and it was openly declared that the present conditions in Springfield are due to politicians catering to negroes and low whites and to the non-enforcement of laws.

€

Last week the Russian The Russian Socialists raised the boy-Duma cott and decided to take part in the elections for the Duma, or Parliament. The reason for this change of front was "their realization that the Duma will be an accomplished fact" because of an additional Imperial manifesto concerning it published last week. The previous manifestoes have been sufficient to convince Conservatives. Moderates, Liberals, and Constitutional Democrats of the reality of the Emperor's proposal. If the Social Democrats had been more wisely led, they would have accepted, as have other parties, the provisions of the Czar's proposal, not only as assuring for the first time in Russian history a National Assembly to the people, but also as forming a standing-ground from which to press for further reforms. That they did not even grudgingly accept the manifesto is largely the fault of the Polish leaders of the party majority, for not all the rank and file were so fatuous. Hence for four months we have seen the amazing spectacle of a large section of the people obstructing the very reform which was to bring them freedom and liberty. With this doubtless in mind, in a recent address before the Academy of Political Science at Philadelphia, Baron Rosen, the Russian Ambassador, said:

Impartial history will take into account that, in a time of great political upheaval, men's minds are apt to lose their balance, and that, in the fever-heat of political passions long confined and at last unloosened, deeds will be done that will fill some day with burning shame the hearts of the very men who committed them. But severe will be the verdict of history on all those who, whether for selfish ends or blinded by political fanaticism, have been inflaming the passions of the easily deluded (because politically and economically ignorant) masses, thereby doing their best to defeat the noble endeavors of the sovereign and his govern-ment peacefully to lead the country into the path of constitutional liberty based on the reign of law and order.

Baron Rosen declared that the Imperial manifesto,

Opening to the Russian people the gates of freedom, never to be closed again, is an event deeply affecting the future of a country equal in size to one-sixth part of the habitable globe and the destinies of one-tenth part of the human race. By the side of the liberation of the serfs this is the greatest . . . act ever accomplished by a Russian sovereign.

The Czar's manifesto last week definitely creates a legislative and not a merely advisory body, for it provides that

No law will hereafter be effective without the approval of the National Assembly and

Council of the Empire.

The latter body will consist of an equal number of appointed and elected members, taken from the clergy, nobility, zemstvos, Academy of Science, universities, trade and

There will be two houses, both of which will have power to introduce legislation which does not affect the fundamental laws of the

The annual sessions will be convoked and

closed by Imperial ukase.

Both the Council of the Empire and the National Assembly will have the right to ask Ministers regarding alleged unlawful acts. The sessions will be public.

In this connection we note that Count Witte, the Premier, has apparently triumphed over the reactionary tendencies recently and outrageously represented by the Minister of the Interior, and has issued a circular to the provincial Governors instructing them not to interfere in the coming elections, and announcing that the activity of the police will be limited to prevent illegal voting. The eyes of the whole world are fixed with keener and more sympathetic interest than ever on the transition of the Russian Government from autocracy to constitution-

The oppression of the Jews The Jews in Russia has long been a in Russia cause of wonderment to other No Iew in Russia may buy land or farm it; he may not live in the country, and only in certain parts of a town. He may not be a schoolmaster or professor, or even a teacher in a Christian family; he may not be educated at a public school or university, unless he is included among the Hebrew "exceptions," about five per cent. of the whole student number, though in Odessa ten per cent. has been granted. He may not sit in a town council; he may not be an officer; he may hold no State appointment. He may not even move from place to place without a special passport and special permission. The Jews are numerous in South Russia in general and in Odessa in particular. According to the correspondent of the New York "Sun" who has recited the above facts. the population of Odessa is about 600,-000; according to the London "Times's" correspondent, about 430,000; the important fact, however, is that a third of the population is Hebrew. The correspondent of the London paper declares that long before the recent massacre in Odessa the central Jewish organization sent emissaries from Poland to Odessa; that many Jewish students and other Jews openly displayed revolvers, for the emissaries had brought an arsenal with them; that revolutionary meetings had. been continually held at the university; that the students had organized a School Strike Association, by

which they had been able abruptly to dissolve many educational establishments; that they had made barricades in the streets and had instigated rioting there. The excited tone of the deliberations in the Municipal Council, however, was responsible for much of what followed. A passionate majority demanded of the president that the military and civil Governors of the town should be memorialized to withdraw the guards, the Council guaranteeing to enroll a citizen constabulary to maintain order. Governors naturally replied that without superior authority they could not comply, whereupon half a dozen policemen were At this moment the Freedom Manifesto arrived (October 30), but the popular passion was not appeased. flags were everywhere unfurled, and the Russian national emblem was dishonored by having all color except the strip of red torn from it. The mob even gained possession of the City Hall, mutilated the Emperor's portrait, and then declared the dynasty abolished and a South Russian Republic established.

88

The Government's Record

Meanwhile other influences were at work in Odessa, General

Trepov started one influence, says the "Sun's" correspondent, when he urged the civil Governor, Neidhart, to allow a demonstration of the so-called Lovalist Black Hundred on November 1. Another influence was started, says the "Times's" correspondent, when the leaders of certain workmen's unions were informed by the police that the cause of all the trouble was the Jewish question the Jews demanding freedom and equality, and yet, gaining these by the Imperial manifesto, now demanding a republic; that vodka, the Russian whisky, helped to stimulate this sentiment; that police emissaries, disguised as workmen, led parties of workmen and dock hangers-on to the Jewish poorer quarters, and instigated plunder of property—an easy task, first, because of race hatred, and, second, as the "Sun's" correspondent informs us, because the fire at the time of the Odessa mutiny last summer destroyed part of the docks, entirely burning away the

wooden viaduct upon which the dock railway runs along the whole face of the port; furthermore, there was distress not only among the dockers, but among all the lower class of laborers. The average wage for unskilled labor in Odessa is only forty cents for a ten hour day, and life in that town is more expensive than in most Russian cities. The Jews defended themselves against their attackers with unexpected strength. The result was a horrible carnage. Leading Jew merchants vainly telegraphed to Count Witte, the Premier, says the "Times's" correspondent; and Baron Kaulbars, the military Governor, also turned a deaf ear. The latter is credited with having dryly remarked: "I have orders that this freedom for which you have schemed and agitated shall be tested for three days without interference from me." When the three days of unparalleled license to the assassin were over, General Kaulbars marched his battalions into the street, and order was restored. In a later issue of the "Times" Rabbi Gaster, of London, denies that emissaries had been sent from Poland. but admits that ever since the Kishinev atrocities the Jews had naturally banded together for protection and self-defense. He also challenges the statement of the "Times's "correspondent that about four hundred lews had been killed, declaring it to be nearer four thousand. In a still later issue of the "Times" the Odessa correspondent gives authority for the statement that the Jews had long been arming, and had ultimately armed between four thousand and five thousand He shows from the cemetery records that only three hundred Jews were actually killed, but declares that of the forty thousand persons rendered homeless and destitute the vast majority were Jews, and that of these a great proportion were inoffensive people. It is gratifying to learn from the "Sun's" correspondent that not only has much relief come from outside contributions, but also that the town of Odessa has already spent \$75,000 in that direction, and has voted as much again for the maintenance of the distressed. While the exact facts are still in doubt, it is certain that Odessa has suffered sorely.

Missionaries and Merchants in China The missionary disaster at Nanchang, China, is now declared to have been due to a quarrel

between a Roman Catholic priest, who, according to the treaty of 1897, was exercising civil functions as a taotai, and the natives. The latter held a massmeeting, which was succeeded on the following day by a riot, during which the property of the Roman Catholics was burned. Six priests and two members of a Protestant family were killed. The Chinese Governor attempted to check the riot and rescue the missionaries. Most of the French Roman Catholic, English Protestant, and American Methodist missionaries found refuge, many of them at Kiukiang, to which point American ships had been ordered up the Yangtse River. The cause of the Nanchang disaster, like the causes of those at Lienchau, Changsha, and Changpu, is thus seen to have been proximately Mr. Rockhill, American Minister local. to Peking, telegraphs that there are not more missionary disturbances than usual, and Mr. Bland, the London "Times" correspondent at Shanghai, says that Boxer outbreaks are unlikely, but adds that "organized obstruction appears probable:" he may refer both to the opposition now manifested by the Chinese to all commercial undertakings in the Empire by foreigners, and to the antidynastic feeling. Interesting testimony is at hand from the Chinese press itself. The "North China Herald" says that "the recent riots are but manifestations of tendencies universal throughout the Chinese Empire;" the "Peking and Tientsin Times" declares that Chinese suspected of anti-dynastic tendencies are to be immediately arrested; according to Dr. Sun-Wat-Sen, the South Chinese agitator for reforms, this will affect four-fifths of China's population. The "Overland China Mail" confirms the reports that the sluggish life of inland China has been stirred both by antiforeign and anti-dynastic agitators. While this agitation may not always affect the missionaries, there is perhaps some significance in the fact that the four missionary disasters above mentioned have occurred in southern China, where anti-

foreign feeling is especially strong and where antipathy to the reigning Manchu dynasty, which once showed itself sharply in the Taiping rebellion, has long been smoldering. A chief reliance of those who expect protection for missionaries and merchants, as well as for the Imperial Government itself, may be found in the veteran Viceroy Chang-Chi-Tung, who still holds his great power at Hankau, governing the two important provinces of Hunan and Hupe. In military reform he has been doing on a smaller scale in the Yangtse Valley what Yuan-Shi-Kai, Viceroy of the Province of Chili, has accomplished there. Chang-Chi-Tung was the one Viceroy who, because of the Boxer riots in 1900, did not lose his head, physically or officially.

Church and State

Pius X. has now taken two important steps concerning the status

of the Roman Catholic Church in France. According to a despatch from Rome, he has issued a papal encyclical condemning the law which provides for the separation of the Church and State in France because it is repugnant to the Church's divine constitution, because the public exercise of worship is intrusted to lay associations, and because the freedom of the Church is submitted to the will of public officials. A few days later, at a secret consistory, the Pope created nineteen French bishops in the dioceses made vacant by reason of the recent Franco-Vatican struggle. Thus, despite the encyclical, French Roman Catholics may congratulate themselves on being again provided with bishops. As to the recent disturbances in the churches, the opinion of some distinguished French Catholics is worth quoting. Speaking for those somewhat conservatively inclined. M. Ferdinand Brunetière, editor of the "Revue des Deux Mondes" and one of the present leaders of French Catholicism, condemns any priests who may have encouraged the recent anti-Government demonstrations. While he shares the indignation of Catholics against the separation law, he sees no infringement of their rights in the operation of the inventory, which he declares to be merely

the legal way of preparing the devolution of Church property to the "associations cultuelles "required to be formed by the State to control the Church property, unless, indeed, it is desired that it should become State property. M. Brunetière points out that the fact of an inventory having been taken must tend rather to hamper than to facilitate any meditated spoliation; furthermore, now that the Government has begun inventories, he recognizes the necessity to finish the list. Speaking for the liberal Roman Catholics, another equally eminent Frenchman declares that the vast majority of Roman Catholics in France are loyal both to Church and State; they recognize the immeasurably enhanced spiritual force henceforth to be exercised by the Church because of its liberation from the former State control obtained by the Government's right to nominate candidates to vacant sees in return for a money equivalent; they also believe that the State will gain as much in its liberation from the clerical intrigues aimed at its overthrow-intrigues never characteristic of the Roman Catholic Church in France as an entirety. As to the recent disturbances in the churches, says this personage, when such a frank monarchist as Cardinal Richard, Archbishop of Paris—the head of the Roman Catholic Church in France-shows a loval and courteous submission to the State, no ecclesiastic of lesser rank should dare do otherwise.

Professor Samuel Pierpont Professor Langley, Secretary of the Langley Smithsonian Institution, who died at Aiken, South Carolina, last week, after a short illness, was one of the bestknown scientists of the day. His connection with the Smithsonian Institution had borne fruit in many directions and had greatly increased the usefulness and advanced the authority of that institu-For many years he was a devoted student of solar phenomena; and in dealing with the special problems presented in this field his most valuable service to science was rendered. was specially interested in the endeavor to analyze the luminous cloud-covering of the sun, examining its spectrum and

making charts which were important contributions to the knowledge of the subject. In order to achieve these results he had perfected the bolometeran instrument which was of extreme delicacy when he took it in hand, and in its development, under his tireless study, recorded differences in temperature to the millionth of a degree. But while the heat spectra and other sources of radiation of the sun occupied a first place in Professor Langley's interest, public attention has been most directed to him of late years by reason of his experiments with flying-machines under the direction of the War Department. air-ship on which he had spent so much time and thought failed to realize his hopes, but the experiment was made on strictly scientific principles, and the failure was due, in the opinion of many students of the matter, to certain faults in the method of launching. What the aeroplane will do in the future remains to be seen. Professor Langley never lost faith in it, and it is reported that the machine is now in condition to be tried again, and that a trial will be made at an early date. Professor Langley was a very clear and delightful writer, with the rare faculty of dealing with technical subjects in untechnical language. The thoroughness of his knowledge and his mastery of clear and delightful English are shown in "The New Astronomy." He was a devout reader and a lover of literature, familiar to an unusual degree not only with the best English but with the best French writing. George Borrow was one of his familiar companions, and his collection of Borrow manuscripts is said to be extensive. He was not only an indefatigable worker, but a tireless writer, and his written contributions include more than one hundred titles. He was a member of many scientific societies, and had friends among scientific people in all parts of the world.

•

General Schofield A month ago the death of Major-General Joseph Wheeler removed one of the most prominent of the Confederate Army veterans of the Civil War; last week the

death of Lieutenant-General John M. Schofield removed certainly an equally important veteran from the Union side of that war. General Schofield was a West Point graduate in a class containing Sheridan, McPherson, and Hood. In the Civil War Schofield's first duty was as mustering officer for the State of Missouri. He soon became well known as an artillery officer, rising steadily in rank and remaining with the Department of the Missouri until 1864, during which period he organized the State militia and forced the Confederates south of the Arkansas River. General Grant now put him in command of the Army of the Ohio, thus placing him at the head of a force of 17,000 men forming the left wing of Sherman's army in Georgia. With this force Schofield took part in all the operations of the Atlanta campaign, and after its termination, going to the assistance of Thomas in Tennessee, found himself opposed to his West Point classmate Hood, whom he defeated disastrously at the battle of Franklin. Schofield's "gallant and meritorious service" at this battle gained for him the rank of Brevet Major-General. His forces captured Fort Anderson, Wilmington, and Kinston, and formed a junction with Sherman at Goldsboro. At the surrender of Johnston's army at Durham Station the following month Schofield executed the military convention of capitulation, received the arms, and paroled the prisoners. After the war Lincoln sent Schofield on a mission to Europe in relation to the presence of European troops on the American continent; the Schofield report had great weight in the Administration's maintenance of the firm front which finally resulted in the departure of the French from Mexico. In 1868 Schofield succeeded Stanton as Secretary of War, and was promoted to the rank of Major-General. For six years Schofield was Superintendent of the West Point Academy, and afterwards occupied various distinguished military posts. On Sheridan's death in 1888 Schofield became Commanding General of the Army. The rank of Lieutenant-General was revived and conferred upon him. As a man of sterling character and solid attainments, as an active officer in the field,

and as a military critic of acknowledged prescience and poise, General Schofield served his country long and well. He was a fine type of the scholar, soldier, citizen, and gentleman.

Last week at Nash-The Student ville, Tennessee, oc-Christian Federation curred the fifth International Convention of the World Student Christian Federation. conventions are held once in four years. Their purpose is to enforce the missionary message to the student body throughout the world; to furnish information about the physical, mental, moral, and religious conditions and needs of the various races and nations: to interview and direct those inclined towards foreign missionary service; to organize these volunteers into a band of brothers. whose business it shall be to further the missionary propaganda; to stimulate general interest in all forms of missionary activity. The Federation is composed of national student organizations such as the American and Canadian Student Young Men's Christian Associations, the British College Christian Union, the Australasian Student Christian Union, and similar bodies. Toronto convention in 1902 was attended by forty Harvard men, the largest delegation present. This year, on the basis of the University's size, Harvard was entitled to forty-one representatives. More applied, however, than could be The same interest was accommodated. manifested in other colleges. When the Convention opened, there were present nearly five thousand auditors and delegates from the many universities, colleges, and seminaries upon which the Federation has brought its agency to bear with such thoroughness and constancy as to make an effective missionary impression. Upon the stage were seated leaders in the missionary work of practically all the Protestant Churches in Christendom, and the Convention was addressed by such orators, among others, as Mr. John R. Mott, Chairman of the Executive Committee; Mr. Robert E. Speer, Secretary of the Presbyterian Board of Foreign Missions; Dr. George Robson, of Edinburgh, Moderator of the United Free Church of Scotland; Mr. J. Campbell White, of Toronto, Secretary of the Forward Movement of the United Presbyterian Church; and Dr. Thomas F. Gailor, Protestant Episcopal Bishop of Tennes-The students and others interested in the Convention subscribed towards the expenses of the Student Volunteer Movement for the coming four years about \$85,000. But the most inspiring feature of the conference was the deeply religious spirit pervading the assemblage, a spirit which, we hope, includes an increasing realization that education as well as enthusiasm must be a vital part of the missionary's equipment.

A Lenten Meditation

The figure of the Christ in the wilderness appeals even more impressively to the modern than it did to the ancient The Orientals of his age were familiar with solitude, for it is through renunciation, withdrawal from the world and separation from its fortunes that the ancient way of release from pain and sorrow lies. The first stage in escaping from the great illusion of life is to flee The "wheel of life" whirls from life. the spirit through endless series of sorrows, until it disentangles itself from all relations with time and sense, and makes itself one with the Absolute. To the modern world, immersed in great and significant affairs, and driven on by the unescapable tasks imposed upon it. the desert and the wilderness seem unutterably lonely and desolate. men of the Middle Ages avoided deep woods, the summits of mountains, and all wild and remote places, and clung to one another in a world full of imaginary even more than of real enemies, so the men and women of to-day flee the solitary places and are eager to fight their battles together. In the wide, unpeopled waste the figure of the Christ stands out in strange and appealing majesty.

He did not seek remoteness and desolation after the Oriental manner, however; for he was bent not on escaping from life but upon mastering it, penetrating to its very heart and returning to it that he might fill all its courses with a deeper vitality. He did not withdraw from life: he went a little way out of it that he might re-enter it with victorious power. It was not to get away from sadness of spirit, misery of body, hardships of condition, that the Christ left the world, but that he might pierce these outward appearances and discern, what the Oriental has yet to learn, that pain and sorrow are not evils to be escaped, but forms of discipline to be accepted from a love so much wiser than ours that it has not only perfect tenderness but perfect courage He did not flee from the horror of sin, defiling life at its fountain sources, because he thought it an illusion, a nightmare of the imagination from which one might awaken himself in the silence of the desert. He knew that sin was a great and terrible reality, and he sought the companionship of God that he might return armed and equipped for the long warfare that should finally destroy it. He did not turn away with sinking heart from the specter of death haunting every home and shadowing every happiness; he went apart that he might come back to his fellows to raise their dead, to stand serene beside all the graves of the world, to be buried after the manner of his kind, and to come forth radiant and triumph. ant in the power of his Father, and to say with the mighty emphasis of his own resurrection to the hosts of the sorrowful and bereaved, "I am the Resurrection and the Life."

The Christ went into the desert not to save himself but to save the world: not to protest against the order of life but to open the eyes of men to its divine significance; not to escape from a Wheel of Life that was a vast circle of torture, but to show life as an ascending spiral whose final curve is in the presence of God. He went into solitude and silence that he might come back to be forevermore the companion of all who suffer, are cast down, oppressed, forsaken, or The wilderness was a place sorrowful. of sore trial to his spirit because he had to drink of the cup of sorrow which life puts to the lips of all its children. There is no loneliness which he did not know, no solitude with which he was unfamiliar, no isolation which he escaped, no sense

of being forsaken in which he did not share; but in the wilderness loneliness became the source of sympathy, solitude of tenderness, isolation of a passion for fellowship, the consciousness of being forsaken for a deep and abiding sense of the unescapable presence of God. The world was not an illusion to the Christ, it was a spiritual reality; the experiences of life were not mere delusions of a creature confused by temporary relations, they were the methods of divine education; pain and sorrow were not evils to be shunned, they were the tests and trials through which the immortal was slowly evoked out of the mortal. Christ pierced the illusion that the world is an illusion and discerned its divine reality; and in the light of the spiritual order which became clear to his spirit in the wilderness he came back to life, not that he might take men out of its meshes and entanglements, but that he might make them its masters and give it to them more abundantly.

Railway Rate Regulation

The newspapers muddle the railway rate regulation situation unnecessarily. It is not as complicated as some of them seem to think, and as perhaps some of them desire to make their readers think. The varying opinions can all be put into three classes.

First are those who think that the courts can render all the relief which the public needs. If any legislation is required, it is only law to make unlawful certain practices which have grown up and to expedite legal proceedings for their prevention.

Second are those who desire to see the Inter-State Commerce Commission given power, in dealing with inter-State commerce, to determine what is a just and reasonable rate, a power which the courts do not possess and which cannot constitutionally be exercised by them; but they also desire that the decision of the Commission shall be subject to a review by the courts in proceedings which would practically make possible a retrial of the whole issue decided by the Commission.

Third are those who wish no power to be given to the courts which they do not possess under the Constitution to review all executive and administrative, acts. It is not easy to say exactly what that power is, but in general terms it may probably be said that it is not power to retry the case already tried by the Commission, but is power to reverse any decision of the Commission on the ground that its interpretation of the law has been incorrect.

Mr. Roosevelt advocates the third view, some of his advisers the second; no one of his official advisers has publicly avowed himself as an advocate of the first view. Of course there are in each of these parties differences of opinion; but if our readers will keep in mind this simple statement of the fundamental principles, they will be able better to understand the issues as they are sometimes not very clearly or intelligibly debated by Washington correspondents and in daily press editorials.

The Joint Statehood Bill

The Joint Statehood Bill, which provides for the admission of Arizona and New Mexico as one State, and Oklahoma and Indian Territory as another State, will, it is announced at this writing, come before the Senate for action on the 9th of March. This agreement probably means that the debate on this measure will then be opened and carried on without the intervention of any other business until a conclusion can be reached. In answer to some correspondents, The Outlook here redefines its position upon this bill.

We reaffirm our conviction that the question whether any Territory shall be admitted as a State and how it shall be admitted is one to be determined primarily by the Nation, not primarily by the people of the Territory. The Congress representing all the people has both a Constitutional and a moral right to determine whether such a Territory shall be divided into two or more States, or

whether, if there are two or more Territories, they shall be united into one State. Such questions are to be determined primarily by a consideration of the interest of the people of all the States, not by a consideration of the opinions of the population which happens at the time to be residing within the Territory.

But while this is true, it is also true, as a general proposition, that it is not for the interest of all the States that any Territory should be converted into a State or a part of a State against the will of the people who reside in that Their will to come in is not Territory. at all conclusive of their right to come in: but their will to remain out raises a very strong presumption that they should be permitted to remain out. The coercion into the Union of a reluctant population is Constitutional, but is rarely expedient. The right of the Congress to enact a law converting a Territory into a State cannot, in our judgment, be successfully controverted; but only extraordinary circumstances can make it wise for Congress to exercise that right against the will of the people inhabiting the Territory.

There are indications that there is a considerable sentiment in the Indian Territory, especially among the Indians and their friends, against union with Oklahoma. How strong this sentiment is we do not know, though we judge that it is probable that a majority of the inhabitants of the Indian Territory would prefer to come into the Union with Oklahoma as a State than to remain as a Territory. If so, we do not think that ancient treaties with the Indian tribes should prevent the Indian Territory from being so admitted, since, so far as we can judge, the rights and interests of the Indians can be better promoted under a State than under a Territorial organization. It is affirmed by the Arizona Anti-Joint-Statehood League that at least ninety-five per cent, of the people of Arizona are opposed to its admission as a State in conjunction with New Mexico. It is claimed that the people of that Territory would prefer to remain indefinitely a Territory rather than to be united in one State with New Mexico. The grounds of their objection to such

union have been stated in the columns of The Outlook. Whether these grounds are adequate or not, we are not able to see that there are any National interests dependent upon the immediate admission of Arizona as a State sufficient to overbear the wishes of the people of Arizona, if the Arizona Anti-Joint-Statehood League is correct in its opinion.

For these reasons, while we are quite clear that these four Territories ought not to be admitted as four States, and while, so far as we can see, the objections against the union of these Territories into the two States do not counterbalance the advantages, so that if we lived in Indian Territory we should probably vote for its union with Oklahoma, and if we lived in Arizona we should probably vote for its union with New Mexico, we are nevertheless of the opinion that the Senate should adopt the Foraker amendment, extending it so as to apply it to the Indian Territory and Oklahoma as well as to Arizona and New Mexico. The amendment so enlarged would provide for an election in all four Territories, and would admit Oklahoma and the Indian Territory as one State only in case the people of both Territories, voting separately, voted for such admission, and the people of Arizona and New Mexico as one State only in case the people of both those Territories, voting separately, also voted for their admission as one State.

In short, while we reaffirm the right of the Congress to determine under what conditions any Territory shall be admitted to the Union, we think the consent of the people of each Territory involved should be one of the conditions which Congress should require in the present case as a condition precedent to its admission.

Our statement last week, in the paragraph entitled "The Fight Against Race-Track Gambling," of the revenue derived from the "privileged stand" of bookmakers and poolsellers at the New York race-tracks requires correction. We are informed that last year the stewards changed the rule at a sacrifice of revenue, and now admit those gentlemen simply on tickets like everybody else.—The Editors.

The Spectator

On different occasions during the last few years the Spectator has spent several weeks at a time in the home of a Virginia farmer, a member of the middle class, a growing body at the South, where of old there was only the division of high caste and "poor whites" in the Caucasian population. The farmer was kindly, shrewd, honest, intelligent, industrious, prosperous. He was amazingly pious, quoting Scripture for everything he did. "From him that would borrow of thee, turn not thou away," he lived up to literally, but with discretion. To him the texts "In the sweat of thy brow shalt thou eat thy bread," and "He that will not work, neither shall he eat," meant what they He was his own hired man a great part of the time, because labor was not easy to get and not satisfactory when gotten. Sometimes his wife went with him to the field. "Not that I have to work in the crop," she said, "but my man wants my company."

@

She was as pretty a thing as one might care to see. They had been married fourteen years, and he called her "Sweet." She had a hired girl to help about the house. Her husband allowed her to do no heavy work, none that would hurt her, on the farm. . Knocking down corn-stalks, tying fodder, dropping corn or tobacco plants, gathering peas, loading wagons with fodder, and other agricultural offices, when continued for a reasonable time, involve no more labor than golf or tennis, and not as much as basket-ball, bag-punching, walkingmatches, and races across country, in which things the modern young woman indulges with pride, for the fun of it and for the good of her body. " Sweet," who knew naught of fashionable athletics, walked along beside her husband and knocked down corn-stalks, or followed his plow, dropping corn into fur-She was rosy and healthy. "Working in the field with my man is not nearly so tiresome as my indoor work," she would say. "My head aches when I work in the house too much. And my man needs my help." On an

afternoon the Spectator, looking out of his window, beheld her, in her pink print frock and pink sunbonnet, sitting on a load of fodder. When the wagon stopped in front of the barn, she stood up on the hay and tossed bundles into the loft, laughing and bandying words with her "man." "She is getting as much fun out of it as if it were tennis," the Spectator meditated.

3

One night the Spectator put down his pen and descended to the living-room. There he beheld by lamplight and leaping firelight a picture he longed to paint. White-oak splits littered the floor; brown farm baskets (browned by use and exposure) stood around, upside down, right side up, and sideways; and two happy folks were patching them with the new strips, or splits, that gleamed like white ribbons interwoven with the brown. It was like a scene in a kindergarten for grown-ups.

6

Another night, when "Sweet" and her "man" were not to be discovered in the living-room, the Spectator, with fine perspicacity, walked out to the tobacco barn. While he does not use tobacco himself, he must confess that there is to his mind a most delectable fragrance hanging around these old Virginia tobacco barns in "curing" time. The interiors are picturesque with the dark weeds hanging overhead and all around like canopy and curtains, the glow of smoldering fire in the center of the earthen floor, the "hands."—strippers, graders, and tiers—sitting around, deftly twisting and turning the leathery leaves. In the past such work was done almost wholly by negroes. The Spectator saw in the rich mahogany gloom of the barn, feebly lit by two lanterns, the white man and his pretty wife. He went in and sat down by the man: "Can I not help?" "Well, I reckon maybe I can teach you to tie," was the surprised but cordial answer. "I didn't think town folks would like this sort of work." The Spectator profited by instructions, and, if he says it who should not, succeeded in doing his part fairly well, and received praises and congratulations with becoming modesty.

The Spectator rambled into a field which was being cleared of rocks. farmer's wife and her hired girl were tossing the smaller stones into the wagon, while the farmer was handling the larger ones. The hired girl was saying, in a spirit of rivalry, to her mistress, " Ef I can't beat you makin' good lightbread, I kin beat you th'owin' rocks in de waggin!" "Go slow! go slow!" said the farmer. "I don't want back-broken women around me! Sweet, you and Jinny Sue leave them big rocks alone, I tell you!" "Sweet," her slim body poised, her two hands holding a rock above her head, laughed back: "Don't you fret! You're the back-acher in our house-goin' out all sorts of weather in any sort o' shoes! I don't know I've got a back!"

The Spectator discovered the ox-cart at the edge of the woods, and "Sweet" and Jinny Sue picking up chips from ground covered with fragments of fallen "Would you like to help?" the trees. former asked the Spectator, with a merry twinkle. The Spectator helped, grateful for the invitation. "We'll store these under one of the sheds,", said she, "against a rainy day. And," in a burst of generosity, "you can get a basketful for your fire whenever you like. These fat-pine chips are fine for making a fire burn bright." An aristocrat of the old school riding by paused to "pass the time o'day." "Would you like to help pick up chips?" the farmer's wife asked him politely. He dismounted and "helped," selecting very large pieces of pine bark for his gatherings, stooping and bending laboriously in the task. "He don't know much about picking up chips," said she to me in an aside, "but then," apologetically, "he wasn't raised to it. He does the best he knows how."

Presently she uncovered a basket and treated us to a lunch of fried chicken and lightbread and pie, washed down with a glass of milk which had been kept cool in the spring near by. Evidently she regarded picking up chips as a festival. The Spectator has come to

look back upon it in that light. The smell of the woods and of the new chips, the vision of the green pines, red-leaved maples and sweetgums and lordly golden poplars on one side and the expanse of tan broomsedge on the other, are with him now, teasing him to flee again the dust, grime, rush of the city, and hie him where he may pick up chips to an accompaniment furnished by singing birds and cawing crows which sing and caw as if there was nothing else in this world to do but sing and caw.

From the farm-house the Spectator wandered by devious ways leading through pleasure resorts where people labored diligently to amuse themselves, and found himself presently at a little wayside hostelry where the proprietor's wife was her own cook, housemaid, and everything else, her servant having fallen ill, or quit suddenly, or otherwise failed her, and it being impossible to secure another for love or money.

In his room that night the Spectator was thinking of the farm-house. A timeworn, finger-worn Bible lay at his elbow. Many a guest had turned its pages. The Spectator opened it and read, "In the sweat of thy brow shalt thou eat thy bread," with a new understanding. "Is this a curse, after all? The college athlete does not consider the sweat of his brow a curse. The girl who plays basketball does not consider it so. Why should labor that God blesses, rewarding it with bread, be so considered? With love and peace, all labor is godlike, kingly, sweet, and joyful. Will it not come to pass that those who have not enough to do will reach out eagerly, tenderly, to hands that are overtasked and claim their share of work as duty, privilege, and pleasure?" A tired sigh just outside his window gave his philosophy a setback. Then these words, uttered by a lady boarder, floated in from the "piazza:" "May I not string those beans for you? And you go to bed; you've been up so long; you rose before the sun. My hands are tired of lying still, while yours have too much to do."

FINLAND AND HER RELATION TO RUSSIA

BY BARON SERGE A. KORFF

Head of the Russian Law Course at the University of Helsingfors

HE crisis that Finland has recently passed through and the manifesto of November 4 of the Czar restoring the old Finnish guarantees have completely changed the position of this small State and her relation to her greater neighbor.

The restoration of her old rights came to Finland not quite unexpectedly. Already Prince Obolensky's policy was characterized by the slackening of the system of Russification of his predecessor, General Bobrikoff. Now that the country has again her constitutional guarantees and Prince Obolensky is succeeded by Privy Councilor Gerard, an educated and trustworthy Governor, the relations of Finland to Russia have entirely changed, and the change is cordially welcomed both by the liberal Russian party and also by the Finns, although not by the Russian reactionaries, who look upon the Finnish constitution and the Finns' recently acquired liberty as a severe blow to their pride and to their

The administration of Bobrikoff was particularly galling to Finland, as the people had been accustomed to independence and freedom since the reign of the Emperor Alexander I. Her constitution and juridic relations to Russia have been well described in the works of Telliulk, Pillet, Despagnet, Brie, Fisher, and Lapradelle; they all agree on the question of the existence of the real union between the two countries being similar to the union between Austria and Hungary, or the former union between Sweden and Norway.

The Czar's manifesto of November 4 was the solemn restoration of Finland's old rights, and is so considered by the Russian Government, by all the liberal parties of Russia, and also, naturally, by the Finns.

The policy of Russification that lasted

for about six years had strained to the utmost the good relations of the two neighbors. All of General Bobrikoff's measures aimed at the introduction into Finland of the methods of the Russian bureaucracy, and the means employed were almost invariably compulsion and force.

The Russification consisted in compulsory teaching of the Russian language in the schools to the detriment of Finnish and Swedish, the mother tongues of the population; in the appointment of Russian bureaucrats and officials to all the important positions in the civil government; in the introduction of press censorship, not known in Finland since the eighteenth century; in the court-martialing of all those who tried, even passively, to resist Bobrikoff and his associates (later on such persons were deported, without trial, to remote Russian cities). All this was done with the object of reducing Finland to the position of a Russian province, and utterly regardless of the great racial and historical differences between the two countries.

The repressive policy of Bobrikoff and his associates was the more hateful to the Finns because they had been for nearly a century accustomed to full political freedom and liberty. Unlike the Russians, the Finns never knew slavery or serfdom, and until 1898 they knew of bureaucratic evils only by hearsay.

Under the constraint of Bobrikoff's rule the strong character of the Finn grew still stronger; his will had a better training; his ideals were focused on one point—the restoration of liberty, law, and order. The heavier the pressure of the Russian Government, the worse the action of Bobrikoff, the better the Finn learned to draw a line of distinction between Russia private and Russia official; and the worse the hatred grew against the latter, the stronger were the

Digitized by Google

sympathies that were manifested for the former of these classes.

The stormy days of the November strike afforded strong proof of this, and showed plainly that no feeling of national hatred exists now, or ever did exist, between the two countries, though the Russian and the foreign press have for years past spoken so often and so much of the national dislike of the Finns for the Russians that it is difficult even now to persuade the world of the fallacy. The reactionary and official press of Russia endeavored to persuade the people that racial and national hatred existed, and offered that as a reason for the detested policy of Russification.

The events during the past months afford the strongest possible proof of the sympathy existing between the Finns and the Russians. During the strike one could see Russian soldiers and Finnish workmen going about the city arm in arm. Russian and Finnish children marched together in procession through the city.

At the University a new society has been organized, whose aim is to study Russian history, life, laws, and conditions.

On the day the manifesto was published, every shop on the main streets displayed Russian and Finnish flags and ribbons of the National colors draped together. The Russian relief concerts and money collections attracted many hundred Finnish marks. These are significant facts. The good understanding has undoubtedly grown very much stronger during the last months, for the Finns realize that the whole empire of Russia is struggling for freedom and liberty, and to throw off the yoke of the bureaucracy. With such a movement the Finns heartily sympathized, having so recently learned to know by their own bitter experiences the ways and means of bureaucratic government.

The natural consequences of this form of government and the result of the policy of generating national hatred are only too clearly demonstrated in the present conditions existing throughout the whole empire. The Baltic provinces are devastated, Poland is in a perpetual state of siege, and the Caucasus is in

open rebellion. Considering these facts, the calm evolution of Finland is certainly noteworthy.

The Czar's manifesto restored Finland's old order of government, provided for the summoning of the Diet, and referred to the latter the reform of the nation's representation.

And now as to the cardinal question of the future relations of the two countries to one another. From careful study and observation, I can confidently assert that not only does Finland not desire to separate from Russia, but separation would be decidedly detrimental to the best interests of both countries. Finland agrees to the union with Russia as it was outlined by Alexander the First. Russia has exclusive control of foreign affairs, the military and naval policies, and consequently the right of settling international questions. At the same time, the Czar, as Grand Duke of Finland, has the right to summon, open, adjourn, and close the Finnish legislature, and has at the same time a farreaching power in all legislative questions and in the administration of law.

The Governor-General, the highest executive officer in Finland, is and will be a Russian, responsible only to the Czar, who has the right of confirming the nomination of Senators. All military and naval forces stationed in Finland are under the direct orders of the Russian Minister of War. Those are the bonds that bind the two countries into a close union. Finland agrees to this union, and will maintain it—a union with Sweden being now impossible and undesired by the Finns.

Although Finland does not wish to separate from Russia or to break the union, she nevertheless stoutly defends her independence. What Finland desires is a separate legislative body, the independent administration of her internal affairs, and, in short, to stand his somewhat the same relation to Russia as that of Canada to England, which would be as advantageous to Russia as to Finland.

The main determining question of modern life is trade, and trade prospers only when peace is guaranteed. The administration of Bobrikoff and his colleagues did not and could not stimulate exchange between the two neighbors, their relation being too severely strained. The longer Bobrikoff remained in office the less became the exports and imports on the Russo-Finnish frontier. For the past year the conditions have materially improved, and exports and imports show a very large increase.

Finland imports from Russia foodstuffs, meat, and flour, and it sends to Russia paper, wood, iron, and manufactured goods. It is quite clear that when friendly relations are firmly established the trade of the two countries will prosper and develop, to their mutual benefit.

As the Russian press quite rightly pointed out, Russia must have the full right and opportunity to take requisite measures to protect herself against her enemies in case of war. A frontier within thirty miles of the capital and undefended is far too dangerous, as Finland fully realizes. Russia has a row of fortresses on the Finnish fjords, has the supervision of pilots, and the authority to mine all harbors and channels. She keeps stationed in Finland a whole army corps, and she can always use for military purposes the Finnish railway system. To these and similar rights the Finns have never objected.

Finland has free trade with Russia, and there have never been any customhouses on the frontier. Russia, on the contrary, having a high tariff, has to keep her Finnish border closed by cus-The extension of the Russian custom frontier to Finland is quite impossible. It would ruin Finland and be a great burden to Russia. It could not increase the revenue of the latter to any extent, and would cost millions of rubles to guard the Finnish coast, for topographical reasons. This question is so well understood by the Russian Government that even under the Bobrikoff régime it was proposed only by the most ignorant.

Such are the relations between the two countries. Among the unsolved questions which are agitating the Russian nationalistic party are these: the question of citizenship of Russians in Finland, and vice versa; the civil serv-

ice question; real estate ownership; and, last but not least, the military service of the Finns. The present laws give many privileges to the Finns, to which the Russians object. Russians have not the same positions in Finland that Finns have in Russia. This is certainly unjust, and was one of the reasons offered for the Russification of Finland. pily, both Governments realize the necessity for a speedy agreement on these points. It is evident that the only way to settle them is by a mutual understanding of the Legislatures of both countries. the Duma of Russia and the Diet of Finland. Only by the decision of the representatives of both countries can they be settled, and only in one possible way-full mutual equality. Only by such an understanding will the root of grievances be extirpated and the door opened to the broad path of mutual help and development of brotherly relations of the two countries on their way to culture and progress.

Peaceful as the present relations are, it is nevertheless unfortunate that these remaining points of difference cannot be settled in the near future; but both countries are now in full process of reorganization of their system of national representation, so that temporarily all other questions must remain in abeyance.

Finland's representative reform will be submitted to the Diet in February, but it will be several months before the new Legislature can meet.

The reform now under consideration by a special committee, of which many professors are members, includes universal suffrage of all citizens twenty-one years old, without distinction of sex. The Legislature will probably consist of one House, as in Norway.

The Russian Duma can hardly meet before May, and will at the beginning have so many serious questions to settle that the points referred to must be held in abeyance. Such a postponement, though undesirable, cannot be avoided, and we can only hope that both countries will exercise patience and wait until their representatives can meet and amicably settle the points of difference and not disturb the peace and good understanding by hasty and violent action.

OKLAHOMA AND INDIAN TERRI-TORY

BY GRANT FOREMAN

HE discussion by Congress of the proposition to admit Oklahoma and Indian Territory as a State suggests just one important question—Is that section of the country ready for Statehood? There is nothing in the attitude of Congress toward the subject to suggest any doubt that the people of those so-called Territories wish to be united in one State; just what they desire in the premises, in fact, seems to be of secondary consideration.

In the month of July, 1905, a call was made by the Chiefs of the Five Civilized Tribes for a Constitutional Convention to assemble at Muskogee, Indian Territory, on August 21, 1905. At this Convention there assembled one hundred and eighty-two intelligent representative men, both Indians and white, delegates from every section of Indian Territory, presided over by Pleasant Porter, Chief of the Creek Tribe of Indians. treaties with all the Five Civilized Tribes it is provided that all their tribal governments shall pass wholly out of existence on March 4, 1906. To anticipate this situation, to provide some form of government to take the place of their own, and to provide for local government for people of all classes, it was proposed by this Convention to draft a Constitution and ask for the admission of Indian Territory into the Union.

The Convention laid out its work in a methodical manner, and labored industriously for a month. At the end of that time it had framed a Constitution that would be a credit to any State in the Union; it named the proposed State Sequoyah, after the illustrious Cherokee of that name who invented the Cherokee alphabet; it nominated four members for Congress (two Republicans and two Democrats), to go to Washington and work for the admission of the State of Sequoyah under its proposed Constitu-

tion; it declared in favor of Statehood for Indian Territory separate from Oklahoma, and submitted the whole to the people of Indian Territory to be voted on November 7, 1905—the first general election ever held in Indian Territory.

There is little room for doubt that Indian Territory and Oklahoma are both prepared for Statehood. Either would make a State more populous than any other State at the time of its admission; as populous as any one of eighteen of the States at the present time, and equal almost in area to the average size State east of the Mississippi, with taxable property greater than that of any one of four or five States.

To appreciate the desire for independent Statehood in Indian Territory, one must understand the anomalous relation of this domain to the United States. While called Indian Territory, this country has not even a Territorial form of government; now that the tribal governments are stripped of most of their powers and jurisdiction, it has less of local or representative government than Porto Rico, Alaska, or the Philippines, while possessing a citizenship superior in intelligence and morals to that of many of the States. The government is administered at long range by the rules and regulations of the Interior Department and by the United States Courts for Indian Territory. The people have no voice in the enactment of laws for their own government; they have not even a delegate in Congress, as has Oklahoma. Chafing under this order of things, the people of this country pray to be delivered from any form of government not of their own making and administration. And there are many who think they see in the anxiety of the people of Oklahoma for joint Statehood an intention to take the reins of government in their hands if joined in a State with Indian Terntory, which would savor of the non-rep-

See editorial comment elsewhere.—THE EDITORS.

resentative government which is now so irksome to the people of Indian Territory.

If the Constitutional Convention referred to shall have accomplished no other result, it has furnished a powerful argument in demonstrating the fitness of the people of Indian Territory for Statehood, whether it be separate or ioint Statehood; it has taken a step toward Statehood far in advance of anything done or attempted by the people of Oklahoma; and if these people must go into a Constitutional Convention with Oklahoma, they have demonstrated their right to demand equal terms with her. To give Oklahoma any advantage in a Constitutional Convention or in any of the branches of a joint State would be manifestly unfair. Indian Territory, with a population equal to that of Oklahomaabout 750,000—is vastly richer in resources, of which many—notably oil, gas, coal, and asphalt—are being turned into commercial channels to the extent of many millions annually. It contains unknown wealth of granite and marble, lead, zinc, and other minerals; its agricultural output and its taxable property are both greater than those of Oklahoma. The people of Indian Territory revolt at the idea of uniting in Statehood with a community which may levy tribute upon their vast wealth of resources for the maintenance of State institutions where they are now located in Oklahoma: whether their apprehensions are well founded or not, the feeling exists.

It is claimed by the advocates of separate Statehood that Congress owes it to Indian Territory in order to keep its pledge that it will prevent the introduction and sale of intoxicants in Indian Territory. In various treaties and agreements this promise has been made and it has been faithfully observed: to such an extent at least that it truthfully may be said that a state of prohibition comes nearer existing in Indian Territory than in any State in the Union. These people say they want to be free to handle the liquor question and continue prohibition under the terms of their Constitution. rather than be delivered into the hands of Oklahoma, already committed to the unrestricted liquor traffic. It is not denied that, in treaties with each of the Five Civilized Tribes of Indian Territory, Congress agreed in the most solemn manner never to make any part of their lands part of any State without their consent.

The movement for separate Statehood was manifested in Indian Territory by a campaign of education announcing the principles and logic upon which it rests. The opposition both in Indian Territory and Oklahoma answered that it was an appeal to sentiment; that the Administration is opposed to the policy; that Congress will not admit two States made out of the two Territories, and that there is no use contending for it; and through the newspapers, of which the opposition controls a majority in Indian Territory, it reproduced numerous interviews and letters of Senators and Congressmen committing themselves, in advance of the meeting of Congress, to joint Statehood and discouraging the separate Statehood idea; and it employed every possible argument to persuade the voters to stay away from the polls on November 7. Yet the result of the election on that day. as announced by the election board upon the sworn returns of the election judges, was 56,279 votes for separate Statehood and the Constitution, and 9,073 votes against. Without election machinery, without rival candidates to stimulate voters, and with no revenues to defray the expense of such an election, a total vote of 65,352 votes cast is significant of a deep interest in the question by the people of Indian Territory.

The result of this election was made known to every member of Congress, to be calmly ignored both by the Senate and the House. It is claimed that a large amount of misinformation concerning the separate Statehood movement has been given circulation by the newspapers. Numerous journals over the country have stated repeatedly that the movement is promoted by the railroads, when the fact is well known in Indian Territory that the railroads are exerting themselves vigorously in the interest of ioint Statehood with Oklahoma. papers have, with favorable comment, reproduced statements made by joint Statehood papers to the effect that less

than 20,000 votes were cast at the Constitutional Convention, which, to one at all familiar with the facts, are palpably incorrect. There seems to have been a concerted effort to prevent any expression

by the people of their wishes in the premises, and to deny that expression, when made, the publicity to which it is entitled.

Muskogee, Indian Territory.

KING FREDERIK AT HOME

BY JACOB A. RIIS

HAD never met King Frederikthe Crown Prince he was thenuntil the summer of 1904, which we spent at Copenhagen. As a boy I had seen him often, and pulled off my cap to him, and always in return had received a bow and a friendly smile. But at home, and to speak to, I had not met him till that summer. We were at luncheon at our hotel one day, nothing further from our thoughts than princes and courts, when the portier came in hot haste to announce a royal lackey who wished speech with me. Right behind him up loomed the messenger, in his gold lace and with his silver-headed cane ever so much more imposing a figure than the King himself. "Their Royal Highnesses, the Crown Prince and the Crown Princess," so ran his message, "desired our attendance at dinner at Charlottenlund the next day but one."

"The dickens they do," I blurted out, fortunately in English, with a vision of silk hats and regalia of which I had none. But my wife pulled my sleeve and saved the day. "Would he thank their royal highnesses very much; we should be glad to come," was the way it went into Danish. Whereupon he bowed and went, leaving us staring helplessly at one another. I think we were both disposed to back out. But the children decided it otherwise. Of course we must go. Such an honor!

So we went. After all, it was simple enough. I just borrowed a top hat (that did not fit; I was glad to carry it in my hand in the presence of royalty, for it simply would not come down over my head; it was three sizes too small). The rest was easy. We drove out with the American Minister and his wife, who

were invited too. It was for a long time after a disputed question in our family whether it was the cross of Dannebrog I wore on my breast, and therefore me, the sentinels saluted; or the American Minister. But he wore no cross. My wife insisted mischievously that it must be his carriage. Could she have seen herself, charming princes and princesses alike with her sweet and gracious ways, as she did every one she met, there would have been no mystery. Where she passed, everybody was made glad. They saluted from sheer desire to do it. And then, we were guests of royalty.

Charlottenlund lies in the forest just outside Copenhagen, on the beautiful shore road. It blew in from the water, and the ladies, on account of their hats, preferred to ride backwards. And so, chatting and laughing, we wheeled into the palace grounds before we knew we were half way, and found ourselves heading a procession of royal carriages bent for the palace. They were easily known by their scarlet-coated drivers. We had barely time to change round, to get our wives properly seated, when the door of the carriage was yanked open and lackeys swarmed to help the ladies. In we went. Almost before we could draw breath a door was thrown wide, our names were announced, and the Crown Princess came forward with outstretched hand.

"It was very good of you to come out to us," she said.

Our entrance had been so sudden, due to the hustle to make way for the princes following close upon us, and in thought and speech we had been so far away during the trip, that the Danish greeting left me for the moment dumb, groping my way four thousand miles across the sea. Slowly and laboriously, as it seemed to me, I found the tongue of my childhood again, but awkward beyond belief. This is what it said:

"How very respectable of you to ask us."

The Crown Princess looked at me a moment, uncertain what to think, then caught the look in my wife's face, and laughed outright. At which the Prince came up and heard the explanation, and we all laughed together. The next moment the room was filled with their children, and we were introduced right and left. It was all quite as neighborly and as informal as if we had been at home. Fine young people, all of them; finest of them all Prince Carl, who is now King Haakon of Norway. Handsome, frank, and full of fun and friendliness, he was both good to look at and to speak with; and in that he resembled his father. They all have the slender youthful shape of the old King. But for his furrowed face and the tired look that often came into it in the last few years, no one would have thought him over fifty, though he was nearly ninety. The Crown Prince at sixty-one seemed barely forty.

My wife was taken in to dinner by a prince, a shy, boyish young fellow, whose great ambition, he confided to her, was to live in a New York skyscraper and shoot up and down in the elevator, which was entirely contrary to her inclinations, and she told him so. I was not so lucky, but I shall always remember that evening with unalloyed pleasure for the hearty and unaffected hospitality of our hosts and of everybody. The Crown Prince talked of America and its people with warm appreciation, and of President Roosevelt as a chief prop of the world's peace, at the very time when some people at home were yet shouting that he was a firebrand. He thought him a wonderful man, and we did not disagree. The thing that especially challenged his admiration was his capacity for work—for getting things done. That any one could get access to him in a nation of eighty millions, and get a hearing if he was entitled to one, seemed to him marvelous. He was interested in everything done for the toiler in our great cities, and heard with

visible interest of the progress we were making in the search for the lost neigh-The talk strayed to the unhappy conditions in Russia, the Jewish massacres, and the threatening unrest. My wife was expressing her horror at the things we read, and I began to feel that we were skating on very thin ice, seeing that the Czar was the Crown Prince's nephew, when I heard him say to her, with great earnestness, "You may believe that if my sister had the influence many think, many a burden would be eased for that unhappy people." my heart swelled with gratitude, for Crown Prince Frederik's sister, the Czar's mother, was the sweet Princess Dagmar whom every Danish boy loved when I was one of them, unless he were the sworn knight of Alexandra, her beautiful sister.

After dinner we strayed through the garden that lies in the shelter of the deep beech forest, and when it was bedtime the boys, including my wife's cavalier, came to kiss their father good-night. It was all as sweet a picture of family happiness as if it were our own White House at home, and it did us good to witness. I think our host saw it, for when we shook hands at the leave-taking he said: "You have seen now how happily and simply we live here, and I am glad you came. Now, take back with you my warm greeting to your great President, and tell him that we all of us admire him and trust him, and are glad of the prosperity of his people-your people."

He had expressed a wish to my wife to read our story, and I sent to London for a copy of "The Making of an American," which he fell to reading at once, according to his habit. They say in Denmark that he reads everything and never forgets anything, and has it all at his fingers' end always. I had proof of that when we next met. It was in Ribe. my old town at the North Sea, where he had come with the King and the whole royal house to open the Domkirke, restored after the wear and decay of nine centuries. I was coming out of our hotel at seven in the morning, and in the Square ran plumb into a gentleman in a military cloak, who had a young man for company, and a girl of fifteen or sixteen.
"Good-morning, Mr. Riis," said he.
"I hope you are well, and your wife, since last we met."

It must surely be that I am getting old and foolish. The voice I knew; there are few as pleasing. But the man—. I stood and looked at him, while a smile crept over his features and broadened there. All at once I knew.

"But, good gracious, your Royal Highness," I said, "who would expect to find you here before any one is up and stirring. You are really yourself to blame."

He laughed. "We are early risers, my children and I. We have been up and out since six o'clock." And so they had, I learned afterwards, to the despair of the cook at the Bishop's house where they were staying. He introduced his son and daughter. "And now," said the Prince with a smile that had a challenge in it, "where do you suppose we have been? Down at the river to look at the bridge where you first met your wife. You see, I have read your book. But we did not find it."

I explained that the Long Bridge had been but a memory these twenty years, but to me a very dear one, and he nodded brightly, "Give her my warm regards." She was glad when I told her, for her loyal heart had made room for him beside his sweet sisters from our childhood. When the lilacs bloomed again, I was alone, and he sent me a message of sorrow and sympathy. And because of that, for his liking of her, I shall always love him.

They told no end of stories of the delight he had given by this gift, so invaluable in a public man, of remembering and recognizing men, even after the lapse of years. One peasant, come to town to see the show, was halted by Prince Frederik in the market square, as was I, and greeted as an old comrade.

They had been recruits together in one regiment; for the royal princes in Denmark have to serve in the ranks with their fellow-citizens. They are not made generals at birth. In Copenhagen I was told that the Prince kept tab on all that went on in the Rigsdag, and the man without convictions dreaded nothing so much as his long memory; with reason, it would seem, for not long before, when a certain member of the Opposition made a troublesome speech, the Crown Prince calmly brought out his scrap-book and showed the embarrassed Minister where the same man had taken the exactly opposite stand half a score of years before. It is not hard to understand how a memory like that might become potent in the deliberations of a parliamentary body, particularly among a people with a keen sense of the ridiculous, like the Danes. However, they have something better than that. They are, above all, a loyal people, and King Frederik starts out with their real affection as his working capital. He is as popular as was his father, though in a different way. I have never seen anything more touching or more creditable to a people than the way the Danes put aside their claims when the dispute between them and King Christian's Ministers over constitutional rights became bitter, and the King, loyal himself to the backbone, would not let the Ministers go. "He is of the past that does not comprehend," they said, "but he is our good old King and we love him." And the clouds blew over, and the people and their ruler were united in an affection that wiped out every trace of resentment. The new King is of the present. He knows his people, and they trust him with the love they gave his father. does not need to be a prophet to predict for the prosperous Danish land happy days in store under King Frederik VIII. and his house.

A REMARKABLE PERSONALITY THOMAS K. BEECHER

BY W. S. B. MATHEWS

OMETIME in the early "seventies" an article appeared in the Chicago "Advance" giving an account of a certain new church building proposed by the congregation of the Rev. Thomas K. Beecher, in Elmira, New York. The building, according to this story, was to be unlike anything then existing, being intended for social and educational purposes quite as much as for the formally religious uses customary with church edifices. Besides the usual auditorium and Sunday-school room, this building had a gymnasium, a reading-room, a library, and in the upper stories of the after part of the church a suite of rooms designed for entertaining, the large ones for general purposes of the societies of the church, the smaller to be loaned to the poorer members, after due notice in advance, for their own personal entertaining of friends. There were suitable parlors, diningrooms, cloak-rooms, and kitchens, fully provided with utensils, crockery, etc. Here any person, upon receiving permission, could bring her supplies and give a dinner to her friends, with all the conveniences of the higher society, yet at no expense beyond the arbitrary outlay for service and articles of food. In short, the proposed Beecher Church in Elmira was meant to be, and in fact proved to be (and I suppose still is), one of the first, if not the very first, "People's Palaces" ever erected. All this was interesting. But this was not the point which most attracted me in the article.

The queer thing was the way the money had been voted and raised. All of us who do church business in evangelical circles know what an energetic "effort" it requires to denude a congregation of what it truthfully calls its "substance" in an amount sufficient to build a large church. And I had myself been living in the shadow of a large

enterprise of that kind. Hence my interest in this story, which was about as follows:

It appeared that a few Sundays previously Mr. Beecher, at the close of the Sunday morning service, made a few remarks. He said, substantially: "When I came to Elmira, the First Congregational Church was perhaps the worst church building in Elmira. That was twenty years ago. I think the building has held its own ever since. I do not think it will fall down for some time yet, although there is an apparent weakness in the roof over yonder, which I will have Brother Jones look at to-morrow and see whether it is still safe. Several times since I have been here the question of a new church has been advocated. I have always opposed the idea, because I knew that you were not ready. I did not wish you to get subscription on the brain, and run races to see who should put down the largest sum; nor was I willing to leave a part of the cost on mortgage. Whenever there is a mortgage on a church, the devil holds the mortgage, and the religious life in that church inevitably dies. A new church is not necessary to me. I can preach in the park in the warm weather and in a hall in winter; or I can do as the Lord himself did—preach from house to house. What I am here for is the life of religion in your souls, and preaching is but a minor question.

"Still, there are advantages in a suitable building. I have been talking with an architect, and I find that it is likely to cost about fifty thousand dollars to build such a church as I think we ought to have, if we have a new one. Therefore I am going to put it to you this morning to vote. On the table in front of the pulpit is a box of envelopes directed to me, and in each envelope is a card with blanks. Write your name and address. Then vote on the ques-

Digitized by Google

tions: First, Do we need a new church, and are you in favor of building it now? Yes or No. Second, How much will you give in one payment towards it? Third, How much could you give in three payments towards it?

"Take plenty of time to think it over, and return the envelope to me within five weeks from yesterday. I will open them five weeks from to-day. If the majority decides to have a new church and the amount pledged is sufficient, we will have one. Do not tell any one how you mean to vote; do not talk it over with any one except your wife. What I want is a vote of individuals."

Within a few days the envelopes began to flow back; within the week all were back; yet Beecher was true to his word; he waited out his five weeks, then he opened the envelopes. The vote was practically unanimous for the new church, and the amount pledged aggregated about eighty thousand dollars. The church was forthwith ordered and was then building. The article was signed Mark Twain.

Now, Mark Twain in those days was not widely known as an evangelical worker or as a writer whose stories could be taken invariably at their face value. Therefore the wonderful story stood out forcibly, and created an intense interest to know about how much of it was true. for nothing had then been printed to throw light upon the processes of education which had been operating upon the Elmira congregation for twenty years. Being then a young man of confiding nature, I straightway wrote to Mr. Beecher, asking how much of the story was true. (I did not then know that Mark Twain was Beecher's brother-inlaw-they having, I believe, married sisters.) In due time I got a short note from Mr. Beecher, saying that within a few days he would be visiting in Chicago at his sister's, on Ann Street, and if I would call upon such a day he would be glad to tell me more about it.

Upon the hour I called. I found Mr. Beecher then about forty-five or fifty years old, a strong face, but not with the peculiar mouth of the orator, such as his brother Henry Ward Beecher had, and such as Henry Clay had in a strik-

ing degree. Some of the particulars given above were from what he told me then. I learned that he was to make an informal address that evening before the theological students of the seminary at Union Park. I asked and received permission to attend, and took a friend with me, upon whom the man and the address made as profound an impression as they did upon me.

The talk was made in a hall, a classroom, I think, Beecher remaining seated upon a low platform; the class numbered perhaps thirty or forty, nice serious fellows, maybe a trifle too serious in spots for perfect health. This happens sometimes.

He took for text the verse, "Beware of the leaven of Pharisees, which is hypocrisy." He went on to say that the word hypocrisy had undergone a change of meaning since the English Bible had been made, and had acquired later a meaning which was not what Christ had in mind. By hypocrisy Christ meant that state of mind in which the machine and its smooth working becomes an object for its own sake; it did not mean intentional insincerity. He thought that the Pharisees were perhaps the most sincere religionists of the Jews in the time of Christ; the trouble was not with their sincerity, but with their conception of religion, which they made out to be a matter of formal observances. thought the danger of the kind of hypocrisy which Christ meant to be peculiarly strong with priests, preachers, and ministers, who, standing as the immediate representatives of God himself, became filled with a sense of their own importance, even their indispensability; that this feeling suffused everything they did to such an extent as seriously to impair their usefulness, and in some cases destroyed it entirely. He then went on for some time with a beautiful discourse on the usefulness of the ministry and the privilege of assuaging sorrow and of awakening broken hearts to hope and new life. It was simply a talk by an old minister to a class of neophytes not yet entered into the work. It pointed out the danger, but at the same time magnified the office of the ministry in terms likely to last them a long time.

After the talk there were questions. One asked whether he thought it advisable to preach hell, i. e., the eternal destruction of the wicked. Beecher became extremely affected, and seemed likely to burst into tears. He controlled himself, and answered in a voice full of deep feeling that every man must decide this for himself. He, personally, had never felt himself at liberty to preach the doctrine, for fear of discouraging a seeking soul. At this, one of those very conscientious young men rose up and asked: "But, Mr. Beecher, would not you have us stand up for the truth?"

There was a moment of silence for the poser to strike in. Then Beecher, in a quiet voice, but with deep significance, spoke this apothegm:

"Truth is eternal; it is part of God. If you will give it a chance, the truth will stand up for you."

This was one of those things which Beecher could do: give you a volume in a nutshell, when an occasion arose. I doubt whether any person who heard that sentence will ever forget it.

Upon a later occasion, during this same visit, Mr. Beecher gave me more particulars of the old church. He said that it was terribly cold in winter. "To give you an idea," he said, "water froze one Sunday in a glass by my side on the pulpit while I was preaching. I saw that many in the congregation were awfully cold. So I stopped my sermon and remarked: 'I see that some of you appear uncomfortable, and it certainly is As for me personally, I was cold here. never more comfortable. I have on two pairs of trousers and arctic overshoes." He had on his overcoat, and, opening this, he showed a cardigan jacket over his undercoat. "So if any are cold, you had better go out now, while I wait. It is far better to go home and get warm than stay here and take cold." So a few souls, too frozen to stay, went out, and then Beecher resumed his sermon, and I doubt not gave those who remained ample cause to be thankful that they had done so.

Some months later, while I was engaged in a summer school at Binghamton, New York, Mr. Beecher came down and gave us his lecture upon Church Music. It was a good discourse, but I do not remember much of it now. Afterwards. we had a long talk, and as Dr. Mason and I were walking home with Mr. Beecher, he remarked that during the time he had been in Elmira there had been I forget how many pastors of the other churches—it was a large number. very large. Whereupon I remarked: "Mr. Beecher, you must have a great business in weddings and funerals, owing to your extended personal acquaintance." "Well," he answered, "perhaps in weddings I have my share and more: but in funerals I rather lost my reputation in my first years." This filled us with curiosity to know what he meant, whereupon he told the following story:

"When I first came to Elmira," he said, "I was called to conduct a funeral in the country at a school-house. A man about forty years old had died. went to the place—it was a very hot day in summer—and found that the mourners had arrived in advance of the hearse with the coffin. The widow was a splendid-looking woman, with jet-black hair and eyes, rather well rounded, and well dressed. She was chatting pleasantly with those next her in a low voice. took my seat in the desk and we waited. Presently the hearse arrived and they prepared to bring in the body. As they began, I began to read the usual sentences, such as 'I am the resurrection and the life'—you know them. The minute she heard my voice she began to cry violently and vociferously. I stopped and she stopped. After a moment I went on reading. With the first sound of my voice she began her vociferation. I stopped, and so did she. I remarked, 'If I am to conduct these services, it will be necessary to have quiet.' That woman slid one side of her handkerchief off from one eye and gave me the most devilish look I have ever received in my life. If she could, she would have annihilated me then and there. But she did not set up her wailing again when I went on with the service. Things like this damage a man's funereal popularity."

He then went on with something like this: "But with my own people, if I may say so without being misunderstood, funerals are among the most precious meetings we have. I have done everything in my power to free them from that pagan fear of death, and when I go to the house (for we never have public funerals), I find the mourners sitting around, and I greet them all pleasantly, and we speak appreciatively of the deceased and of his work, and then I read some comforting passages and we sing hymns of heaven and have a short prayer and carry the body away."

Thomas Beecher was a strong and most incisive personality. I think him the strongest of all the children of that patriarch in Congregational Israel, Dr. Lyman Beecher. When Thomas was a boy of fifteen or younger, he used to act as amanuensis for his father, writing the sermons which the old man dictated while walking the floor of the study. Lyman Beecher was a character, and he had the prevailing knack of his day of making the strongest and baldest foreordination, foreknowledge, and predestination agree perfectly with the idea of free grace. It is a high mental trick, that, to have a thing unavoidably and unalterably certain and yet contingent. The Beecher boys could never manage it, Tom least of all. When the doctrine had passed a certain danger point, Tom used to brace himself and break in with, "Father, I do not think that is so." Then he would state his difficulty. Whereupon the father squared off to the argument, and Beecher said that sometimes they argued for two hours on the stretch. His father got warmer and warmer under the collar; but he was good stuff, and knew a "free moral agent" when he saw one, and he knew that his son Tom was of that kind. He used to say, "Tom, Tom, I am perfectly ready to be convinced, but you haven't the arguments." "Whereas," said Tom, "the angel Gabriel, with fresh credentials from heaven, could not have changed father's mind."

So this Beecher got far away from the lines of the family doctrine, and, although strongly biased to the pulpit, he could neither accept what passed for orthodoxy nor yet throw down the bars entirely and go into Unitarianism, which was just then the current dissent. So he got to a period when he realized Christ as the

great example and pattern, but ignored all the rest of his training. In this stress after leaving college he went to Philadelphia to teach a ward school, and his one principle was that he "ought to teach that school as Christ would have taught it." It was a day of routine memorizing of books, an ignoring of principles, and of vigorous corporal punishments. Naturally, the latter seemed widest of all from what Christ would have had.

"To give you an idea of the discipline of that school," he said, "one day I asked a boy, 'Brown, shut the door, please.' Brown answered, 'See you in hell first." "In that case," answered Beecher, sweetly, "I will shut it myself," This went on for several and so he did. weeks, the order getting worse and worse, until one day it was so bad and so little seemed to have been gained that some insolence from one of the large boys entirely broke him down, and he put his head down upon his arms on his desk and sobbed aloud like a baby, with discouragement and grief. "Then," he said, "I prayed; and my prayer was little more than that of the shipwrecked sailor who said, 'O Lord; if there be a Lord, now is the time to put in his oar.

"A few days later there was a sensation in the spelling-lesson. It was that page in Webster's speller, Baker, Maker, etc., and when several had been spelled in the usual perfunctory manner, one boy grasped his head with his hands and rushed into the middle of the room saying, 'I see it, I see it!' 'Well, Jones, what do you see?' I asked. 'Oh, I see,' he answered, 'e-r, one who' (baker, one who bakes, etc.), and it went through the room, and eventually the school, like an electric shock. From that moment on the school began to learn."

"And what of Brown and the discipline?" I asked. "Oh," answered Beecher, "there was no need of discipline; the school, being anxious to learn, disciplined itself."

"And what of Brown?" I persisted. "Brown," he answered, "got very fond of me and followed me about, like a dog, everywhere I would go, thankful if he could only see me and now and then get

a word. When I left Philadelphia for good," he went on, "it was by boat; Brown was out as far as he could get on a spar which projected beyond the pier, and with a great bandana handkerchief was alternately waving it to me and wiping his eyes. Brown was a good fellow and he has made a good man."

And so it came about that Thomas Beecher realized that the family vocation was pressing him more and more, and, after due study, his ordination was to take place. When the day came, his heart failed. Calling his brother Henry Ward to one side (for he was to give the "charge" to the new minister), he said: "Brother, I am afraid to go on. I think I see my way to preach about a year; I will then be preached out, and will have nothing further to give them. I am afraid!" Whereupon Henry answered, "Oh, brother, if you preach Christ one year, you will never stop!"

Thomas K. Beecher was not a natural orator like the versatile and poetic Henry Ward Beecher; he was, as he himself said, "a teacher." What he sought to do was to educate his people. As an example of his unconventionality, this story was told me by a friend in Elmira. On his way to church one Sunday morning he saw a poor woman sawing wood by her little cabin. He placed his hand on the fence and vaulted over in his hearty way, and, pulling off his coat as he came, took the saw out of her hands and went on sawing. "My good woman," he asked, "is it necessary for you to do this work to-day?" She answered that it was: that she had been out "cleaning vesterday, and had gotten home very late and too dead tired to prepare her Sunday wood." "Well," said Beecher, putting on his coat, for he had done enough, "the next time you get in this fix, please let me know on Saturday, and I will send some one to prepare some for you; it doesn't look well for a preacher to be sawing wood on Sunday."

He was very ready, and gifted with curt ways of saying things. For instance, he said one day: "When any of my people leave Elmira to live in New York, they always want letters to join Plymouth Church [his brother's]. They might as well join Broadway!" This

referred, naturally, to the crowds and the continual hurry and change at Plymouth, which was then a sort of evangelical cathedral of the Northern States.

Preachers used to come down to Elmira to investigate the story of how he raised the money for his church. When they had taken it all in, the confiding souls would remark, "I will go right home and start this way of raising money in my church!" "They might as well say they would go home and start an oyster shell," said Beecher.

He was very fond of music, as were all his tribe. Lowell Mason used to lead his father's choir in Boston, and his oldest sister Catherine used to practice on the organ, and Tom had to blow-in other words, to pump—the bellows, a difficult job for a growing boy. Tom used to get the work done on the principle by which Tom Sawyer got the back fence painted charging the other boys something for a chance to pump so many minutes. Meanwhile Tom used to lie on the pulpit sofa and listen to the Bach fugue with which the faithful Catherine was wrestling. One day, in this occupation, he suddenly became conscious of a beautiful melody floating high up above the fugue; it did not seem to be anything which his sister played, but something outside of it, above it. He cried out to his sister, "Oh, sister I hear it, I hear "What do you hear?" she answered. "I hear this," and he whistled the melody. "I have heard it all the time," she replied.

Beecher was never settled in Elmira. He came there, and on invitation decided to preach a while for them, but declined to be settled until he found out whether they would want him. He remained there, I suppose, toward forty years. And if any man belonged to Elmira more than he did, I never heard his name. For instance, one day when the present writer was giving an organ lesson in the Presbyterian church in Binghamton, Beecher came in to hear some music. I was curious to know how he chanced to be there. It came out that the town of Elmira had sent him down to examine two iron bridges in Binghamton, of competing patterns, one or the other of which was to serve

as a model in Elmira for the principal bridge across the river, as Beecher should decide. I have no doubt he decided upon sound principles. He was a man who could.

In his early years at Elmira the Sunday-school was a great trial to Mr. Beecher, but, as he himself said, he "never hurried anything." When he had been in Elmira about a year, it began to dawn upon the more acute that between the conventionality and want of result in the Sunday-school and the preaching there was a difference of kind, and not simply of degree. So they waited upon Mr. Beecher and asked whether he would superintend the school. Beecher's first question was whether they wanted him to be an ordinary superintendent or an extraordinary superintendent. The committee looked at one another in dismay, the distinction being, in Southern phrase, a "huckleberry beyond their persimmon;" and they asked what he meant. Whereupon Beecher defined:

"The ordinary superintendent," he said, "strikes the bell, gives out a hymn, makes the opening prayer, and then walks around and looks important until time to do the same things again and close the school."

This sounded realistic to the committee, and they inquired what the extraordinary superintendent did to fill up the time. "The extraordinary superintendent," said Beecher, "makes it his business to see that the teachers and children all learn something worth while out of the Word of God."

This was too indefinite for the committee, and so they let it go as it was for about another year, by which time the Beecher leaven had begun to work to such an extent that the Sunday-school was plainly out of touch with it. So they came again to Mr. Beecher and capitulated in full, if only he would take charge of the school. Accordingly he did so.

He called a meeting of the teachers and laid down the new rules, which were that strict attendance was imperative, not one Sunday and then a Sunday absent; and that every teacher must learn the lesson perfectly. All unable or unwilling to agree to these conditions were

to resign then and there, and he would find others to take their places. It was a brave congregation, and they mostly stuck. Whereupon Beecher taught them the lesson and what it meant. Then he adjourned for Sunday. When the school had been called to order, the teachers had a genuine surprise. Beecher announced that every teacher would now proceed to recite the text of the lesson to her class, and the class was directed to watch for mistakes. It went on. Then the classes recited in turn, and then the new rules were given out. They were three in number:

Perfect attendance, except for unavoidable cause.

Every pupil to know the lesson perfectly.

Every pupil to put something in the collection.

Upon the latter point he elaborated at some length. He said it was not the money he was most after, but the habit of responsibility and of bearing one's fair share in all co-operative enterprises. Therefore he ordained that the contribution should be at least one cent. He preferred them to earn this cent by some little errand rather than to ask their father or mother for it at the last minute. And when through poverty or ill fortune a cent was not obtainable, the pupil should cut out a little piece of paper, round like a cent., write "one cent" on one side and sign his name on the other. This perfected his status concerning the contribution, for he knew that no one would avail himself of this unless it was necessary.

To all who were perfect for the Sundays of six months the church would present, at the morning service, a New Testament, suitably inscribed. rules had been in force for several years when he was telling me. He went on: "I wish you could have been there last Sunday, for it was my Testament Sun-The class numbered about thirty; some we e over sixty years old; one was a washerwoman; then there were small children not over seven or eight. stood in line in front of the pulpit, one of our best deacons about midway, waiting for his Testament like the others. And I made them a little speech on the

principle of having done well 'as rulers over a few things,' and gave them their books with my writing in them, the date and the period during which the perfect record had been earned."

I remember that Mr. Beecher told me that he had been seduced one year into joining the International series of lessons; but he did not find them to answer his purpose, so ever since that time he had made his own course, taking care to cover the essentials of Biblical knowledge within a reasonable series of years. He also told me that he had a great deal of trouble in limiting his Sunday-school to his own church as nearly as he could, owing to the lack of room in the church for the large numbers who desired to come; I think he also hated to seem to be intruding into the sphere of the other pastor's influence.

When I knew him his attitude with

regard to alcohol was not that of Miss Willard. Naturally, as a Christian minister he was in the fullest compass of the term "a temperance man," but he was not a total abstainer upon principle. I was told that in his later years circumstances brought home to him new views of this danger to manhood, whereupon he became one of the most strenuous opponents of the whisky traffic. We had conversations upon this subject, but no clear outlines now remain.

The impression which Mr. Beecher made upon me was that of a singularly clear-headed Christian teacher, or perhaps more properly of a prophet of God, a teacher of the principles of right human living in the world that now is; and of course a firm believer in the glories of the life beyond. He was a great man; a character contact with whom inevitably left a deep impression.

THE TOWN-MEETING

BY GEORGE E. GOOGINS

THE town-meeting is one of the oldest and most democratic of our civil institutions. It is typically a New England institution, where it still survives and flourishes with all its ancient veneration and spirit. It has been in vogue since the arrival of the Pilgrims in Massachusetts Bay, and is one of the corner-stones of our American system of government. In fact, the American system is substantially a compromise between the town-meeting of New England and the old House of Burgesses in Virginia—a cross between a Cavalier and a Puritan. In Colonial days the New England town was both democratic and puritanic, and the townmeeting was a place where were put into practice the principles of personal liberty, the voting of taxes by the people, and the responsibility of public officials to the municipality. And these are still the prime objects of the town-meeting. The town-meeting embodies the idea of government by the people—not indirectly, like the old House of Burgesses of Colonial Virginia, but directly, by the

people themselves. It is proof to the people that an election is more than an assemblage of voters for the purpose of dividing the spoils. In the town-meeting, Democracy sits enthroned, and

"The Pilgrim's vision is accomplished here I"

Men of wealth and education discuss public affairs and hobnob with those of lesser fortunes and fewer educational attainments. All mingle together about a common ballot-box, and in the annual meeting discuss and settle important questions affecting the future welfare of the town. Where is the ballot-box purer than at an annual town-meeting in New England?

Town-meeting day to the average countryman is full of significance, and he thinks more of it than of any other day of the whole year. It means more to him than does the Fourth of July or Labor Day, and he shows his interest in municipal affairs when the day comes round by presenting himself promptly at the town hall. The town-meeting is the only show on earth that is sure of its

audience. Positively no postponement on account of the weather! Every male citizen is a star performer, and each assumes personal responsibility for the success of the exhibition. And the townmeeting is always a success.

Every male inhabitant of the age of twenty-one (paupers and Indians not taxed excluded) is allowed the privilege of voting and taking part in the townmeeting. This privilege could not be wrested from the people without a struggle. Only sickness or inevitable accident can keep the citizen away from the annual meeting. He may shirk his duty elsewhere, but never in town-meeting. He votes according to the dictates of his conscience, and takes part in the debates with the freedom and dignity of a Clay or a Webster. The average citizen will find his name wanting in the jury-box without feeling the slightest regret, or will sometimes dodge jury service; but his indignation would know no bounds should he be informed by the moderator on town-meeting day that his name had been inadvertently omitted from the voting list. The citizen who would absent himself from the town-meeting without good cause would run the risk of public criticism and would not elevate himself in the scale of public estimation. responsibility is so essential to good citizenship as that of being present at the annual town-meeting, and the average man performs the duty most willingly.

The first that any of us know about the approaching town-meeting is when we see the warrant up in the post-office warning the inhabitants of the town to meet at the town-house at nine o'clock in the forenoon on the fifth day of March, A.D. 1906, and there choose by ballot a moderator, town clerk, three selectmen, treasurer, school committee, and all other necessary town officers; also to take action on a score of articles enumerated in said warrant. The warrant is issued in the name of the State, signed by the selectmen and the constable. This is the regular annual call, which is usually posted up in some conspicuous place two or three weeks before the day of the meeting. The call is a forerunner of the grand day coming. Everybody begins to talk town-meeting,

and the crowd at the corner grocery increases from day to day. Aspiring candidates get to work in earnest, and begin to put up their political fences, which are down in spots, if not all along the line. The annual election is right upon them.

In most New England towns the annual election is held usually in March or April. After a long, cold winter, the event ushers in the new spring. It is the first holiday of the season, and everybody in the town, old and young, male and female, turns out and gives presence and inspiration to the occasion. It is an occasion you city folk know nothing of. It is a great day in the country, and the citizens enjoy it. The meeting always opens on time and with a bang. Every precinct is represented, and the little hall is crowded.

The little town-house, unpainted and with sharp, sloping roof, stands at the fork of the roads, in the center of the town. There is a cordon of horses and sleighs and pungs around it on this morning-all kinds of rigs, such as you might see in the city. There is nothing so very countrified about these people nowadays. The farmers drive into town on annual meeting-day with stylish turnouts, matched bays, and doubleseated pungs, the best that money can The days of the ox-team and the homely old rigs that were once in evidence at town-meeting are gone forever. The country folk are up-to-date in everything now, and you can hardly distinguish them in dress and manners from the city folk.

Every seat in the hall is taken, and standing room is hardly available. Every citizen feels himself an important factor in the problem of municipal government; and he is. Men do not forget that in serving the community they are at the same time serving their country. Men who will allow themselves to be pulled about and voted by scheming politicians at State and National elections refuse to be dictated to here. The people are supreme, and the majority rules in open town-meeting. This is the day when men leave their farm work and business cares to discharge their duties to their town, and they do not find the task either onerous or unpleasant. Men enjoy the fun, the association, and receive a direct benefit from the proceedings. The town-meeting is a source of incalculable good and a means of education to many men. There is always much to be learned there, including business, parliamentary law, and, above all, human nature. Notwithstanding the fact of its existence for three hundred years, the town-meeting has its enemies. There are iconoclasts who would destroy it if they could have their way. However, its enemies are among those who doubt the ability of the people to rule themselves.

The town-meeting has a ludicrous feature oftentimes, and there are situations which to the spectator seem farcical; yet, on the whole, the system gives general satisfaction in small towns. Like the jury system, it is not likely that any better substitute will be offered to replace The people can be depended upon to do the right thing when it comes to a test. When the majority of the people rule, as they do in the towns, the government is usually satisfactory, and there is very little complaining among the citizens. Not so when the people are ruled by chosen representatives over whom they have no control for the time being. When power is delegated, it is liable to abuse. The only true democracy is where the people vote, choose their own rulers, and make their own laws; of this the town-meeting is the best instance. The system, however, is applicable only to towns, it being too unwieldy in places of large population.

The meeting comes to order when the clerk arises and in trembling, half-audible tones announces the objects of the meeting, and reads the town warrant. Then a moderator is chosen and the business of the meeting is begun. The election of officers comes first on the day's programme.

"Bring in your votes, gentlemen, for the first selectman," thunders the moderator, snapping out each syllable separately.

This announcement is usually followed by a volley of cheers for the different candidates in the field; and then ensues a wild, mad scramble for the ballot-box. If there happens to be a contest on, the excitement is intense; but if the same old board is to be given a re-election, then only slight interest is manifested by the voters.

"Votes all in?" inquires the moderator.

"No! no!" comes the reply.

The crowd of free suffragists continues to jostle and surge around the ballotbox, like angry seas about a derelict. The scene is a picturesque one, and the excitement of it all is quite enough to hold one's interest. Everything goes along smoothly, until some fellow who is a trifle the worse off for liquor staggers up to the ballot-box and persists in voting the second time. But the moderator sees him and excludes the ballot. That is one of the sad features of a town meeting.

National politics and party prejudice are wanting in the town-meeting. Party lines are not drawn, though sectionalism is often responsible for strife in the town-meeting: When a new town hall or school-house is to be erected by the town, everybody wants the building located in his district, where it will be of the most convenience to himself. To settle the question of where a public building should stand has been known to require three town-meetings. Before the settlement was made the people divided, and one-half of the town threatened to secede from the other.

The principal officer in the town-meeting is the moderator. He is to the town assembly what the speaker is to a legislative body. He is vested with much power and authority, and his word is law in all decisions pertaining to the meeting. From his decisions there is no appeal. He is accepted as authority on parliamentary law, and, when armed with a copy of the revised statutes and Cushing's Manual, he is invincible. The office is no sinecure, however, and is a trying one to the man who wishes to conduct the meeting with fairness and impartiality. The moderator is usually a man of character and high standing in the town. He is generally respected, and no one makes serious objection to his rulings. The moderator has the power to authorize the constable to remove any person from the assembly who does not conduct himself according to the usages of civilization. He is at all times master of the situation. The moderator who can manage a town-meeting with the least possible friction among the citizens is usually awarded a vote of thanks and three dollars per day by the Assembly.

Formerly the moderator was expected to be a man physically capable of quelling any riot or disturbance which might suddenly arise, without the assistance of the constable. A lively tilt at debate often terminated in a fistic combat, and the moderator who would not stop the fight was not asked to serve at the next annual meeting. But the standard of morals, as well as of living, has been raised in the country, and men have adjusted themselves to the new conditions. The average citizen knows his place in modern society, and strives to keep it. Fistic combats at the polls are not so common now as in the old days. Men have learned to govern their political prejudices, their tempers and emotions, and are not so pugilistic as were some of their sires. Sobriety and reason predominate now in the body politic.

And the crowd one sees about the town-house now is not the same in personal appearance as that which congregated there thirty or forty years ago. At the town-meeting you see more college-bred men, more fine horses, more tailor-made suits, and you breathe a different atmosphere both socially and politi-Jeffersonian simplicity is the exception rather than the rule even at the New England town-meeting. Men still possess their own peculiar prejudices and dislikes against aristocratic tendencies: but the trend of public sentiment in the country is toward refinement, and toward a government based upon intelligence and a free, unhampered ballot.

The town, as a rule, is free from political chicanery, and the art of grafting is unknown to those who manage the affairs of the municipality. A dishonest town official is never re-elected, and, more than that, if he has committed any offense he is immediately punished. Those who seek the public offices are prompted by pride and ambition to be honored by their fellow-citizens, rather than by the

salaries paid. There are no high salaries in the town. Notwithstanding, there are many candidates in the field, each striving to be exalted above the others by the votes of the citizens. To be chairman of the board of selectmen in any country town is the ambition of every citizen, yet this honor can fall only upon a few. It is an honor coveted by those who are qualified to fill the position. The best men stand ready to accept responsible positions in country towns; and, practically, they serve without pay.

The town-meeting is an excellent school for the young man who has political aspirations. Notable men have come from the town-meeting and sat in Congress, but this might have been due to their own native energy, rather than to any superlative virtues of the town-meeting as a school of statesmanship. But in the town-meeting is found an opportunity for the embryonic orator to develop his art. He can make as many speeches as he desires if only he confines his talk to the questions before the house. More than one finished orator got his schooling here.

There is a sociability at town-meeting not enjoyed at any other public meeting. Men meet their fellows on equal footing. and exchange ideas on every imaginable subject, from farming to the building of the Panama Canal. It serves many as a market-place where merchandise is bought and sold, and more than one shrewd trade is consummated before the meeting adjourns. For swapping horses the town-meeting is an ideal place, and more than one farmer drives away with an unknown horse, having made the "shift" while the work of legislating for the town was still proceeding. There is only one occasion affording better opportunities for horse-shifting, and that is the country fair. It is not unusual to have the wheels of municipal legislation stopped by the horse-traders. The moderator is saying, "Gentlemen, listen to the reading of the report-" And then comes the interruption in this fashion: "I'll give ye ten dollars to boot, and throw in the old Concord waggin." Then the constable interferes at a critical moment, and a good trade (for somebody)

is peremptorily spoiled. The business of the assembly is resumed.

All the officers are usually elected during the morning session, and then, after dinner, the articles in the warrant are taken up, duly discussed, and passed upon by the citizens. This, of course, is the most important part of the whole meeting, since it involves the responsibility of appropriating money to be expended for the town during the ensuing year. The watch-dogs are promptly on hand to check any tendency toward undue extravagance or any wanton waste of the public fund. The cry of retrenchment and economy is often heard, but the usual amount of money is always appropriated, for the majority favors a liberal support of the public schools, the building of good roads, and a reasonable outlay in every department of municipal requirement.

But these measures are not adopted without considerable debate, or before the local orators have been given a chance to display their ability at public speaking. There are always a few good speakers in the assembly, and their words carry weight with the citizens. petual oratory in town-meeting, as elsewhere, is not in favor, and the man who is always jumping up and talking on subjects which he knows very little about, and in which he has no special interest, is generally looked upon as a bore and an unavoidable nuisance. When some young man, who makes his maiden speech, arises to address the assembly, the citizens give him close attention and generously applaud him. The old fellows clap their hands and say to each other, "He's smart and will be in Congress some day." But such prophecies are rarely fulfilled.

In the town-meeting much valuable time is occupied by men who have come into the assembly to air their personal grievances or to even up old scores against their neighbors. These men are citizens of the town, and must of course be heard. They do not always stand in order, nor is their language complimentary to their opponents, but the assembly takes their harangues in good nature and with kindly toleration hears them A debate of this kind affords much amusement, and no harm ever comes from it, since the disputants are never taken seriously. Once, in a town of my acquaintance, the town-meeting was enlivened for a number of years by a discussion of this kind between two citizens, A and B. So regularly did it occur that it became a permanent feature of the annual town-meeting. A and B got into a personal quarrel, which had finally resulted in a lawsuit between the parties. A's house was situated on a road but little used by the town, and, prompted by a desire to even up matters with his enemy, B succeeded each year for a number of years in getting inserted into the town warrant an article asking the town to discontinue the road. The article was regularly taken up and bitterly discussed by the two men, but each time the town voted not to close the road. The road is still open.

But a town-meeting quarrel, as a rule, is like a passing cloud; it is soon over. It is seldom renewed outside of the town-house.

Finally, the last article in the warrant having been disposed of, some citizen arises and addresses the chairman:

"Mr. Moderator, I motion that we adjourn."

"Moved and seconded that we adjourn—'tis a vote," says the moderator all in one breath.

Then the men swing on their heavy coats, pull down their caps, and file slowly out of the town-house. On the outside they loiter to review the proceedings of the day, but the crowd of village statesmen soon disperses and the town-meeting for 1906 passes into history.

THE CORPORATION PROBLEM'

THERE is no doubt that just as the most conspicuous feature of the development of society in Europe and the United States on its formal or institutional side during the past half-century has been the growth of corporations, the most striking social fact to-day is the movement in the direction of bringing corporate activity under stricter State control, if not of absorbing the corporation to a large extent in the State. The idea of State ownership and operation of railways, telegraphs, and other utilities admittedly of a public nature seems to be rapidly gaining in favor, whereas only a few years ago its advocacy met slight response. Even those who view with alarm such extension of the State's sphere of action concede that some means must be devised to check the growing power of the corporation. But as to the proper course to be followed there are wide differences of opinion, arising from varying concepts on the one hand of the constitution of the corporation, on the other of the place of the corporation in society. What is emphatically needed is a clarifying of ideas concerning not simply the corporation problem, but the corporation itself. Obviously, this can be obtained only by a broad and thorough review and painstaking analysis of past as well as present corporate functioning—in other words, by a careful study of the historical evolution of the corporation.

It was the appreciation of this fact that, some ten years ago, prompted the late John P. Davis to undertake such a study. It was Dr. Davis's hope not only to follow the development of the corporation, but to make an exhaustive examination of the corporations of to-day, with particular reference to those of the United States, but ill health prevented him from dealing with contemporary phenomena in any detail. In fact, outside of the introduction and three chapters discussing respectively the nature of corporations, the legal concept of corporations, and the characteristics distinguishing modern corporations from their predecessors and those linking the new with the old, his treatise, which has been published posthumously, is essentially a survey of corporations of other days than ours-obsolete ecclesiastical organizations, guilds, colonial companies, etc. As such it is a monument to the enthusiasm with which its author approached and the industry with which he prosecuted his task. It is also highly suggestive, penetratingly analytical, and rich in information useful to the economist. jurist, and legislator; and if it is impossible wholly to agree with Dr. Davis's findings as to facts or to deem his inferences always sound, it is equally impossible to deny the value of his work as an aid to the more intelligent consideration of its important subject.

Apart from the amazingly detailed exposition of the genesis, rise, and decline of the many corporations which Dr. Davis surveys, interest centers chiefly in his concept of the corporation and in his deductions concerning the future of those corporations with which we are most intimately acquainted. In beginning, he points out that, as a general thing, criticism of corporations has gone to one of two extremes: it has been largely negative and destructive from a failure to recognize the permanent and enduring elements in corporations, or it has credited to them elements contributed by other social factors, the result being unqualified denunciation by one group of critics and extravagant approbation by another. From this confusion of ideas, the argument runs, has further resulted the condition of the body of law intended for the interpretation and enforcement of the rights and duties of corporations. In Dr. Davis's opinion the legal theory of "artificial personality" is "pernicious," and must be wholly discarded, in the case of public as well as private corporations, before the problems involved can be successfully attacked. His view of the nature

Digitized by Google

of the corporation is well set forth in the

¹ Corporations: A Study of the Origin and Development of Great Business Combinations and of Their Relation to the Authority of the State. By John P. Davis, Ph.D. Two volumes. G. P. Putnam's Sons, New York.

definition he offers: "A corporation is a body of persons upon whom the State has conferred such voluntarily accepted but compulsorily maintained relations to one another and to all others that as an autonomous, self-sufficient, and self-renewing body they may determine and enforce their common will, and in the pursuit of their private interest may exercise more efficiently social functions both specifically conducive to public welfare and most appropriately exercised by associated persons." Under this definition there is, strictly speaking, no room for the so-called private corporation, and it is not surprising to find the writer describing the private corporation as a contradiction in terms and insisting that it has no place in a sound organization of society. But, he continues, "the distinction between public and private functions is never easy to determine, and it is not made easier by democratic theories of society and the State; all functions have tended to reach the same level, and 'incorporation for any lawful purpose' has been freely permitted to all."

Further light on his concept of the cor-. poration and on his view of the future of the type of corporation which predominates to-day is afforded by the emphasis he lays on the fact that corporations have been most active during periods of social growth and expansion, while organic periods of social life have witnessed the extension of the machinery of the State. As he puts it: "Society has appeared to develop its new activities during periods of transition in the framework of corporations as a kind of scaffolding or provisional structure, to be destroyed during organic periods, when the State and Church have been able to absorb, partially or wholly, the new activities and incorporate them within their own structure." This position Dr. Davis finds little difficulty in justifying by the argument from history. Of the numerous corporations considered in the earlier chapters of his book, most have gone out of existence, some have been so remodeled by the State that they have

virtually lost their corporate identity, and only a few remain as survivals of a past condition of society. The modern corporation, indeed, seems to be substantially new, not merely in point of time, but of nature, and Dr. Davis does not hesitate to admit that a superficial view almost warrants a doubt whether a study of old corporations, such as he has made, is profitable as a preparation for the study of the corporations of to-day. But he immediately proceeds to show that while society has changed both in structure and activity, the function discharged by corporations is unchanged, and that "when a group of associated individuals is confirmed in its character as a group for the accomplishment of a public purpose through the pursuit by the group of private interest, the group is as much a corporation under the new definitions as it would have been under older ones." All of this leads him to the belief that the fate which has overtaken the old will overtake the new corporations. Already, as he shows, the State has in more ways than one encroached on the field of the modern corporation, and even before his manuscript was completed in 1897 the agitation in favor of "public ownership" was beginning to gain ground. So markedly was this the case that Dr. Davis could write: "It is beginning to be recognized that more government is necessary under the developed conditions now attained by society than under the comparatively simple conditions prevalent a century ago-and that such increased government has actually been provided, not by the State, but by corporations. plain tendency in corporate life at present, in its relations to the State, is in the direction of subjection and submission to close supervision." But he warns his readers that "in history the State has never been satisfied with the mere supervision of corporations by commissions or otherwise; it would be against the teachings of history to expect that now the State will stop short of the complete absorption of the governmental features of corporations."

Comment on Current Books

Among the books of evi-**Important** dently serious value which New Books will be treated at some length in The Outlook at a later date may be named: the first two volumes of the definitive edition of Nicolay and Hay's "Complete Works of Abraham Lincoln" (F. D. Tandy Company, New York), now enlarged with new material and with introductions and poems-in these volumes Richard Watson Gilder and President Roosevelt furnish the introductions, and the poems were written by R. H. Stoddard and Dr. Weir Mitchell; Mr. George S. Merriam's "The Negro and the Nation" (Henry Holt & Co.); "Americans of 1776," by the well-known historian Mr. James S. Schouler, and described as an original study of life and manners-social, industrial, and political—for the Revolutionary period (Dodd, Mead & Co.); "Studies in American Trade Unionism," by Dr. Jacob H. Hollender and Dr. George E. Barnett (Henry Holt & Co.); and, in fiction, Maarten Maartens's "The Healers" (Appleton), and Anne Douglas Sedgwick's "The Shadow of Life" (Century).

There still is ample Descartes, His Life room in English literaand Times ture for such a work as this, commemorative of the genius who put modern philosophy on its feet, the glory of France in the seventeenth century, a star of the first magnitude amidst the clouds of stormy times. Descartes's distinction as a philosopher has eclipsed his fame as a savant of encyclopædic learning, but this volume is concerned with the man amidst his varied experiences, his struggles, vicissitudes, and friendships, quite as much as with his achievements in knowledge and in the rationalizing of thought. Miss Elizabeth S. Haldane, whose brothers, J. S. and R. B. Haldane, are well known in the learned world, has finely told the story of the honest, constructive skeptic, who freed reason from the shackles of scholasticism, who found the ground of certainty within rather than without the mind, and whose epoch-making work entitles him to rank with the foremost leaders of human thought. (E. P. Dutton & Co., New York. \$4.50, net.)

The Development of the European Nations

Mother field, a struggle of another kind, and other motives appear in this volume than those exhibited in its predecessor, reviewed in The Outlook of January 6. The spirit of nationalism had done its work in State-building;

the spirit of commercialism now enters to find for it in colonial enterprises an expansion impossible at home. The sanguinary struggle of European Powers in the eighteenth century for the possession of North America is succeeded by struggles for preponderance in Asia, and especially in Africa, which are prevented from becoming sanguinary only by the maintenance of twelve million soldiers to keep the rivals at peace. Dr. J. Holland Rose opens this portion of his history with a chapter looking back to his former volume, "The Triple and Dual Alliances," which secured stability to the Continental Powers as then established, while leaving the Island Power in an isolation not unattended with occasional humiliation. The scene then changes to Asia, where for forty years Great Britain strove to secure her Indian frontier against Afghan turbulence and Russian aggression. But the field of chief interest is Africa, whose occupation by various European Powers during the last two decades of the nineteenth century appeals to the historic sense as one of the most momentous events since the discovery of America. How Britain, through the strangest combination of causes, extended her sway from the mouth to the source of the Nile. and how in other portions of the continent she was enabled to cope tolerably well with Germany and France, more by the enterprise of her subjects and subordinate officials than by the sagacity and energy of her Government, is a story that runs through chapters of continuous interest. The story of the Congo Free State, initiated with high humanitarian professions, and prostituted to the ends of an inhuman commercialism, though dispassionately told, is a blasting indictment of "the weakness and cynical selfishness now prevalent in high quarters." The concluding act of the drama is played by "Russia in the Far East." While all these events are of commanding interest Dr. Rose is more than a mere narrator of them. He exhibits their connection in the line of cause and effect. He unmasks the motives that dictate the moves of the contending parties. He is in touch with the best sources of information for the judicious criticism of events as related to policies. Hence his work is singularly valuable for an understanding of the international relations of contemporary Europe. Thankful that the Empire has survived a great crisis in spite of great blunders, he draws from it a pointed lesson for his countrymen, in whom he sees symptoms of that impaired morale which has been noticed also among ourselves. (G. P. Putnam's Sons, New York. \$2.50.)

Accounts have appeared Excavations at from time to time during Nippur the last fifteen years of the progress made by the Babylonian Expedition of the University of Pennsylvania in exploring the buried city of Nippur, the tomb of a civilization whose beginnings precede the traditional date of the creation of man by many centuries, not to say many millennia. The results now attained, a rich reward for the labor and cost of an enterprise most honorable to our country, are about to appear in a superb form, of which a specimen is before us. The entire work comprises some two hundred large folio pages of topographical introduction and descriptive text, abundantly illustrated with cuts and photographs, including some splendid full-page photogravures, besides many folding lithographic plates giving plans and details of the buildings. The superimposed strata that have been penetrated are shown in distinct colors, and the city itself is mapped in color. To avoid delay, the work is to appear in successive parts. (University of Pennsylvania, Philadelphia, Pa.)

The humanizing ef-Franciscan Legends in fect of the preach-Italian Art ing of St. Francis of Assisi was soon evident not only in religion but in art as well. Italian paintings reflected the change toward a more human interpretation of Christianity which followed the influence of St. Francis. Moreover, the legends of St. Francis provided new subjects for painters. Emma Gurney Salter discusses in this volume, which is somewhat in the form of an inventory with comments, the pictures which are thus related to the saint. Three pages of hints for travelers, a bibliography, a table of painters, and an index add to the usefulness of the volume as a sort of guide-book in its subject. (E. P. Dutton & Co., New York. \$1.50, net.)

This novel is by "Maxwell Gray," whose first book, "The Silence of Dean Maitland," remains the best of her half-dozen or so works of fiction. The title is suggested by the Scriptural story of the rich young man who went away sorrowful; and here a modern young man, whose father's riches have been made by indefensible though common commercial methods, hesitates between the woman who loves him deeply, but not enough to marry him if he renounces his father's wealth, and an honest desire to fight for humanity in his own way and with clean hands. This

is a fine theme, and the spirit in which it is approached is admirable. But as a novel the book needs compression and better proportion, while the exposition of the methods of an imagined altruistic and renunciatory Brotherhood, with which it closes, injures the story as such, without convincing the reader intellectually that the plan is workable. The best thing in the novel is the rapid-fire exchange of sociological epigrams and paradoxes between a group of Oxford undergraduates with which the story opens. (D. Appleton & Co., New York. \$1.50.)

The former publications of The Gospel in Professor W. P. Du Bose, the Gospels of the University of the South at Sewanee, have raised high expectations, which are justified in this his latest work. "The Gospel in the Gospels" is their revelation of God in humanity, and of humanity in God. Christianity is described "in its largest sense to be the fulfillment of God in the world through the fulfillment of the world in God." In this three stages are marked—(1) the gospel of the earthly life of Jesus, the common humanity; (2) the gospel of the resurrection, expressive of the new power communicated by Jesus as the conqueror and destroyer of sin and death; (3) the gospel of the incarnation, presenting the work wrought by Jesus as no mere act of an exceptional humanity, but a work of God fulfilling and completing himself in humanity. These three stages constitute the main divisions of the work. As to the first, Dr. Du Bose sees far more than common humanity in the humanity of Jesus, as a perfect representation both of sonship to God and of the fatherhood of God. As to the second, the death and resurrection of Jesus is, in a purely spiritual view, "the supreme act of faith by which humanity first completely realized itself in God." "Without these it is a great question how much of either Gospel or Gospels there would have been at all." As to the third, the perfect power of Jesus' humanity thus to fulfill itself, and to impart that power to all humanity, reveals in him what transcends humanity. The Pauline saying, "God was in Christ," is accepted, in view of the universal immanence of God, by many who part company in its interpretation. In adopting its ancient and orthodox interpretation Dr. Du Bose relies more on the consensus of Christian consciousness than on the narratives of the virgin birth. These he frankly terms "myths," "pictures," and yet conformable to the inexplicable reality underlying. He holds that Jesus, as son of Joseph and Mary, would be simply an individual man. But he is man, not a man, and this universality of his humanity can

come only of a divine paternity. Such logic will go further with the believer than with the doubter, who may rejoin to the subsidiary appeal to apostolic testimony that conceptions quite compatible with St. Paul's cosmology do not square so well with our truer cosmology. The strength of Dr. Du Bose's exposition of the heart of the Gospel is in the warm spiritual life that pervades it, the high level of thought on which it moves, the broad humanity of it all, and its perceptions of larger truth than is expressed in the creeds which it is concerned to maintain. "If God," says he, "is ever to be spiritually and personally in the world at all, it will be only through the Son of man; that is to say, through the growing divinity of man." (Longmans, Green & Co., New York. \$1.50, net.)

With this volume Pro-The Jeffersonian fessor Edward Channing System carries the "American Nation" serial history from the beginning of Jefferson's first Presidential term to the outbreak of the War of 1812. Thus the period allotted to him is brief, but a great deal of importance transpired during its scant dozen years; so much, in fact, that it is not surprising to find that Dr. Channing has adopted the topical rather than the chronological method. This, of course, gives his contribution somewhat less of unity than most of its predecessors; and, this particular period having already been thoroughly sifted, it has been impossible for him to display any marked originality. But he has, generally speaking, succeeded in investing the wellknown facts with a fresh interest. His pages are rich in acute analysis, suggestive comment, and clear-cut portraiture; his style is lucid, direct, and dignified, his tone judicial. In particular he gives an excellent account of the Louisiana Purchase, the Lewis and Clark Expedition, and the Jeffersonian domestic and foreign policy, although his survey of the preliminaries of the War of 1812 would have been improved by greater emphasis on the significance of the struggle between England and France. He is perhaps least satisfactory in dealing with the Tripolitan War and the Aaron Burr conspiracy, on neither of which does he bestow sufficient attention. His volume includes the usual bibliographical essay which is such a strong feature of this co-operative work. (Harper & Brothers, New York. \$2, net.)

Men and Things
A volume of humorous selections which has upon it the imprimatur of Mark Twain as editor could hardly fail to be good. There are famous bits from John Phænix (Derby), Artemus Ward, and Josh Billings; these

and other passages from the older American humorists are noticeably, and we think advisedly, brief; while the longer selections from Howells, Aldrich, and the moderns (relatively speaking) are thoroughly enjoyable. A few little-known writers are included. Mark Twain explains in an autograph preface that the selections from his own works were put in by his associate editors, adding that this explains why there are not more of them. (Harper & Brothers, New York. \$1.50.)

The familiar saying, "A Physical Nature sound mind in a sound of the Child body," suggests the dependence of mental and moral upon physical conditions. Is a child dull, weak, backward, troublesome, in any way at all abnormal? Probably there is a physical cause, and proper investigation will discover it. Such investigation must have regard not only to the physical nature of the child in various particulars, but also to the conditions of the home and of the school as affecting it. This volume by Dr. Stuart H. Rowe, of the Brooklyn Training School for Teachers, is an admirable guide in this line of work both for teachers and parents. It has been warmly commended by educators at the head of their profession. The need of work in the line which this book opens up is unquestionably urgent. (The Macmillan Company, New York. 90c.)

Once in every ten The Problem of the vears the trustees of Old Testament Lake Forest University, Illinois, are empowered to offer a valuable prize for the best work in the interest of "the religion of the Bible, etc." This prize was offered for the first time in 1902, and in 1905 the committee of award—Professors Ladd, of Yale, Ormond, of Princeton, and Wright, of Oberlin-adjudged the prize of six thousand dollars to the author of this work, Professor James Orr. Dr. Orr, whose special department in the University of Glasgow is apologetics and systematic theology, holds that the methods and results of the Biblical criticism now predominant are so thoroughly erroneous as to threaten the subversion of Christian faith. This conviction has moved him to present in this volume the most comprehensive and elaborate arraignment of them that has yet appeared, but irenic in tone toward the Christian scholars who dissent from him. Fully threefourths of his work are devoted to criticism of the reigning critical view of the Pentateuch. The documentary theory of this, as generally accepted, he rejects, holding to the unity and relative antiquity of "the book," whose "plan . . . must have been laid down

early by one mind, or different minds working together, while the memory of the great patriarchal traditions was still fresh, and the impressions of the stupendous deliverance from Egypt . . . were yet recent and vivid." On the other hand, his admission of "very evident signs of different pens and styles, of editorial redaction, of stages of compilation" down to the time of Ezra is at a far remove from the traditional view, and apparently incompatible with the orthodox theory of an inerrant book. The only criticism for which there is room here concerns Dr. Orr's starting-point. The Pentateuch presents both a literary and a religious problem. Which must we begin with? Dr. Orr says, the religious; the literary problem depends upon it. This seems quite at variance with the scientific and only safe method-the inductive, which by criticism of the literature reaches conclusions as to the religion. E.g., in Joshua we read of the slaughter of Achan's entire family with him for his sin. In Deuteronomy we read that no one is to be punished for a sin not his own. Hence we conclude that, though Deuteronomy precedes Joshua, it was written later: it shows proof of a growing revelation. Dr. Orr rejects the view that man's natural psychical development is the vehicle of divine revelation. He conceives of this as "special," and as supernaturally conveyed from outside the man. But, as he truly says, "everything in the critical discussion . . . depends on the presuppositions with which we start." This is the presupposition which carries him into collision with the Christian scholars in whose view of the immanence of God everything is supernatural, while everything is natural. The multitudinous points taken by Dr. Orr against the prevailing critical opinions present to the unlearned reader a formidable array. He will need to bethink himself that the learned majority from whom Dr. Orr dissents can hardly be ignorant of his reasons, and must have seen more formidable difficulties in the way of accepting them. (Charles Scribner's Sons, New York. \$1.50.)

The Quickening More than usual skill in analysis of motive and description of complex character is to be found in this tale of modern life by Francis Lynde. As has become the fashion, business figures largely in the romance. The hero, a sensitive boy, under the compelling influence of his mother, a narrowly religious woman, begins his life as an unconscious hypocrite, if there be such a thing. How he frees himself from these conventional fetters, yet never drifts away from the strong foundation principles of his training, is remarkably indicated

by the author. The heroine is a true and charming woman, while the supporting characters are all well drawn. An excellent story. (The Bobbs-Merrill Company, Indianapolis. \$1.50.)

This story by Ottilie A. Rändvar Liljencrantz is a well-susthe Songsmith tained romance set in the time when the Norsemen occupied America in fabled Norumbega. Randvar, the son of Freya, a dweller in the forest and a friend of the native Indian, by chance becomes the confidant of the Norse chieftain Helvin, and after many adventures is given the right to win the Jarl's sister in marriage. The Jarl suffers paroxysms of insanity, being controlled by the fearsome werewolf, and this tragic shadow darkens his life and that of his trusted friend. The story is well told, and as a pure romance is well worth reading. (Harper & Brothers, New York. \$1.50.)

Sankey's Story of the Gospel Hymns

Mr. Ira D. Sankey, long associated with the evangelistic

work of Mr. Moody, and now living in Brooklyn, retired and totally blind, here tells the simple but stirring story of his life and work. The larger part of the volume is devoted to brief narratives of the circumstances occasioning the composition and the incidents connected with the use of very many of the "Gospel Hymns" so effective in Mr. Sankey's "singing the Gospel" which Mr. Moody preached. Whittier was criticised for driving his Muse roughly in his anti-slavery poems, and the "Gospel Hymns" are often defective in literary form; but they were written, not to be read, but to be sung to music that opened the heart to their message. Their story as told here, with Mr. Sankey's story of his experience, is one that touches and grips the heart. (The Sunday School Times Company, Philadelphia. 75c., net. Postage, 10c.)

Perhaps no country seizes upon the Sicily imagination more than does Sicily, for it seems to combine Italian natural charms with Greek historic associations. The guide-book prepared by the late Augustus J. C. Hare has now been published in a revised edition by Mr. St. Clair Baddeley, the author of "King Robert the Wise." The author's great fund of information is presented in compact style, as is of course desirable for a small volume which one can carry in the pocket. The style might have been made somewhat clearer, howeverespecially with regard to ambiguity in the use of relative pronouns—without any necessity of increasing the text. (E. P. Dutton & Co., New York. \$1, net.)

It is unfortunate that the Social Theories author of this book, Willand Social Facts iam Morton Grinnell, by his assumptions, extravagancies, and inaccuracies, not to say errors, impairs the worth of a work which contains some very valuable suggestions. As an illustration of his false assumptions, take this sentence:

If there are men with vast fortunes, they or their fathers have earned them by their superior ability, thrift, and industry, and they have earned them honestly (this we must acknowledge), or otherwise we stultify ourselves and admit that we have not executed, and do not execute, the elementary criminal laws.

In fact, many of the large fortunes have been made either by operations which are not illegal, or by sagacity in securing possession, and sometimes monopolizing control, of wholly unearned wealth which under a right social system would inure to the benefit of all the people. As an example of his extravagancies, take what is implied in this sentence:

It is no answer to say that we would elect our functionaries and rulers as we do now, for what influence has the average citizen now in municipal, State, or Federal government?

The average citizens have overthrown the corrupt rings in Minneapolis, St. Louis, Philadelphia, and New York, and can always overthrow corruption in government, municipal, State, or Federal, whenever they are aroused and determined. As an illustration of palpable error, take this sentence:

The level maintained in and by a union must be the intelligence and ability of the slowest and stupidest, and the tendency naturally is to reduce this level.

In fact, labor is more able and intelligent in those industries in which it is organized than in those in which it is unorganized, and in the organized industries union labor generally turns out products superior to those turned out by non-union labor. To suppose, as our author does, that a small percentage of workers, and these the slowest and stupidest, can control not only the great mass of workers who are quicker and more intelligent, but also the whole community, is a supposition so violent as to be wholly incred-The chief value in Mr. Grinnell's book is that it points out the difference between political and industrial socialism, and in so doing emphasizes both the true function and the real value of the corporation as a contrivance for the distribution of wealth:

The Standard Oil Company when first organized had forty-five stockholders; in 1901 it had four thousand, and now has more. The Sugar Trust when first organized in 1885 had not over three hundred owners. It now has about twelve thousand shareholders or owners.

One purpose of bringing these corporations under Government supervision and subjecting all their operations to Government inves-

tigation is to make them more effective as distributers of wealth by making it safe for men of small means to invest in them. To make effective industrial socialism, which Mr. Grinnell commends, that Government supervision and control which he erroneously calls "socialism in part" is absolutely indispensable. (G. P. Putnam's Sons, New York. \$1, net.)

The Unrealized Logic of Religion

This volume by a British author, Dr. W. H. Fitchett, em-

This volume consists

bodies an argument of invincible strength. The "logic" it exhibits is the logic of correspondence, such as is shown in the exact fitting together of the ragged edges of a torn card. Such logic verifies the great truths of religion by showing their correspondence with the great realities of human nature and experience, and the intimations of the physical universe. Pursuing this "study of credibilities" through the fields of history, of science, of philosophy, of literature, of spiritual life, and of common life, Dr. Fitchett presses it against materialism, atheism, and agnosticism with cumulative force. Such an argument may be pressed too far, in neglect of the distinction required between a religious truth and a particular form of presenting Then the argument fails to convince, as occasionally it fails here. But, for the most part, Dr. Fitchett carries it through admirably. (Eaton & Mains, New York. \$1.25, net.)

What is Religion? and Other

of a series of five talks to college students by Student Questions Dr. Henry S. Pritchett, of the Massachusetts Institute of Technology. He approaches religious questions not only from the student but from the scientific student point of view. This is a point which, unfortunately, the Church still but little understands, and, misunderstanding, dreads. We wish that this unpretending little volume could be read and pondered by all preachers, especially by those who have any of the student class in their congregation, and we wish that the second address, "What is Religion?" could be printed in a tract form and circulated through college Young Men's Christian Associations. Its text is full of suggestions as to the real mind of the scientific student of to-day: "But this I confess unto thee, that after the way which they call heresy, so worship I the God of my fathers." The student class is not infidel; it is not, in the proper sense of that term, skeptical; but it is too independent to take ready-made convictions, and too serious-minded and earnest to make-believe believe. (Houghton, Mifflin & Co., Boston. \$1, net.)

Letters to The Outlook

WOMAN'S SUFFRAGE

The answers to your questions regarding woman suffrage, on page 335 of The Outlook (February 17), are plain and simple:

(1) Suffrage is both a National right and a

special duty.

(2) Persons vote, not property nor families; but those who by industry and self-denial have accumulated property have a right to be protected from those who have not practiced such industry and self-denial, and who would live as parasites upon society.

(3) The individual is the unit of the State; the unmarried woman should have the same place in the State as the unmarried man.

(4) Suffrage is both a privilege and a burden—a privilege which all should share and a burden which all should bear. The military argument has been worn threadbare. Woman bears a large share of military duty in the hospital; if this is not enough, then so much the more should she share the burden of the ballot.

CHARLES E. THORNE.

Wooster, Ohio.

THE NEXT QUARTER-CENTURY OF CHRISTIAN ENDEAVOR

In The Outlook of January 13 Dr. Clark, in his article "A Quarter-Century of Christian Endeavor," lays much emphasis upon the numerical growth of the organization. This numerical growth, however, may be wrongly interpreted. The external features of the movement attracted widespread attention. The reduction of the somewhat complex problem of Christian living to a few simple rules satisfied the less thoughtful. Above all, the recognition, after long waiting, of the value of young manhood and womanhood in the service of Christ and the Church sufficiently explains this phenomenal growth. The success of the movement proves that there is a place in the Church of Christ for a young people's movement; it does not prove that the young people's movement as we know it is filling that place.

After a quarter of a century it becomes evident that Christian Endeavor has not learned to adjust itself to present and changing conditions. The result is that as the young people of the passing generation are nearing middle life their enthusiasm is not being duplicated by the youth of to-day—and it is not the young people's fault.

Externalities can attract, but they cannot hold and continue to inspire the Christian enthusiasm of successive and ever-growing

generations. In societies that were organized during the early days of the movement and in which the young people have advanced in Christian culture there is a decline of enthusiasm, for the old standard no longer inspires their loyalty. In societies where there has not been this advance in Christian culture there is lack of virility, for the old standard has not been outgrown. The cause of this condition is twofold. First, too little attention has been given to the adjustment of the local society to local conditions. It is time for us to break away from our bondage to international systems of Christian work and training. Alliance with world-wide interests need not involve world-wide simultaneous action or universal conformity of method. When not in accord with the highest degree of efficiency, it is merely a matter of sentiment. There should be finer adjustment (1) as to aim—each local society should subordinate itself to the needs of the local church; (2) as to organization, only that degree of organization should be permitted which is in direct proportion to the demand of efficiency which grows out of necessity.

A second cause of the present state of decline is a wrong conception of the nature of the Christian life. The Endeavor pledge names three activities which the Christian is to make "rules" of his life, and further asks the young Christian to promise to perform three duties. Why all this legislation? Why this elevation, or rather degradation, of one or two ways by which the new life finds self-expression from a natural impulse to a test of discipleship? Can we expect the thinking, growing young Christian to regard year after year the Christian life as conformity to rules rather than loyalty to moral convictions, and always to test the reality of that life by

its verbal expression?

Even if these requirements could be kept, which, as a matter of fact, they are not, and consequently thousands of promises are broken each week, should not our young people advance beyond these legalistic conceptions?

What conception are our young people gaining of the sanctity of a pledge, and what of the mystical beauty of the life that is hid with Christ in God? Christ did not say, "If ye love me, keep my commandments," but, "If ye love me, ye will keep my commandments." The time is coming, yea, is now at hand, when the Christian life will be regarded more generally as the natural and normal life, and the expression of Christian experi-

Digitized by Google

ence the natural expression of the heart, not manifesting itself exclusively or primarily in public testimony, but in all the varied activities of life.

Professor George E. How has recently said that the new theology is an attitude, not a doctrine. And this attitude is part of a larger movement, the scientific genius of our time. In the realm of religion it insists that all the dealings of God with man are grounded in personality, and that therefore all our apprehensions of these dealings can and should be expressed in terms of reality. With the growth of this conception, with the passage, as Dean Hodges has said, "from a religion of authority to a religion of the spirit, free, glad, and comprehensive," all efforts to impose upon our young people obligations to other than the truth as it awakens moral response stand condemned. That alone is the voice of Christ. Moreover, it becomes increasingly necessary for us to charge our young people to give utterance only to spiritual realities and only when they are realities. We would not sound a retreat. We cannot abandon our young people's movement. But if we continue upon the present basis, no forward movement will be possible. Unless we emancipate our young people and teach them to enter into the "glorious liberty of the children of God," either they will break their own chains and lapse into a false freedom, not learning that there is a "law of liberty," or, remaining in bondage, theirs will be the "spirit of bondage to fear " and not the " spirit of adoption by which we cry, Abba, Father."

H. S. M.

HOWARD CROSBY CLASSICAL LI-BRARY FUND

February 27 marked the eightieth birthday of the late Rev. Dr. Howard Crosby. The effort is now making to perpetuate, in a modest way, the memory of one of New York's noblest sons, a man active, scholarly, virile, cheering the weak and weary, self-forgetful. It may be appropriate to recall that he was Professor of Greek in New York University and at Rutgers, Chancellor of the former (1870-81), founder of the Greek Club (December 30, 1857), one of the Company of Revisers of the translation of the New Tes-

tament, President of the Association for the Prevention of Crime, ever a fearless champion of what was righteous and wholesome. It is now proposed to gather a modest sum, say of two thousand dollars, to found the Howard Crosby Classical Literary Fund, the income of which is to be applied to the strengthening of the Classical Library of the University. The acquisition (in 1902) of the Hübner Classical Collection from Berlin has provided an exceptionally well balanced nucleus of a classical library, which is to be extended by the proposed memorial. Contributions, whether great or small, may be sent to Professor E. G. Sihler or to Professor William E. Waters, University Heights, New York City.

READING MATTER FOR PANAMA

Relative to the letter from Mr. Van Breisen, in your February issue, asking for reading matter for the hospitals on the Isthmus, I would say that I have already received some for that purpose, and a good deal of comfort could be added to the life of the Americans on the Isthmus if magazines and books were sent as follows: Director of Hospitals, Ancon, Canal Zone (for Ancon Hospital and Taboga Sanitarium); Superintendent, Colon Hospital, Colon, Canal Zone; Culebra Hospital, Culebra, Canal Zone; Gorgona Hospital, Gorgona, Canal Zone; Empire Hospital, Empire, Canal Zone; Miraflores Hospital, Miraflores, Canal Zone.

Ancon, Colon, and Miraflores are all large or full-sized hospitals. Taboga Sanitarium is a convalescent hospital, almost exclusively for Americans. Culebra, Gorgona, and Empire, especially the latter one, are small.

C. H. R. CARTER, Director of Hospitals.

Isthmian Canal Commission, Ancon, Canal Zone.

[The Traffic Manager of the Panama Railroad Company, Mr. R. L. Walker, informs us that the Company kindly undertakes to forward from New York to the Isthmus, free of charge, packages of reading matter properly packed for transportation. Packages should be marked "Reading Matter for Hospitals," and sent to the Panama Railroad Company, Pier 57, North River, New York City, and the charges to New York must be prepaid.—The Editors.]

ROMAL Baking Powder

Absolutely Pure

Imparts that peculiar lightness, sweetness, and flavor noticed in the finest cake, short cake, biscuit, rolls, crusts, etc., which expert pastry cooks declare is unobtainable by the use of any other leavening agent.

A pure grape cream of tartar powder. No alum.

THE EDISON PHONOGRAPH

THE above reproduction of an oil painting by Massani, now the property of Mr. Edison, depicts the delighted amazement of an old couple upon hearing a Phonograph for the first time. No less surprised and delighted are those who now hear the improved Edison Phonograph for the first time in a number of years. They are amazed to find it so different from what they thought, their previous opinions having been based on the old style machines or the imitations owned by their neighbors.

The Edison Phonograph is to-day the world's greatest and most versatile entertainer, and Mr. Edison is ever striving to make it better. It talks, laughs, sings—it makes home happy. It renders all varieties of vocal or instrumental music with marvellous fidelity. It offers something to suit every taste—every mood—every age—every day in the year.

No other good musical instrument can be so easily operated at so little expense. It will cost you nothing to hear it at the dealer's.

NOTE—A splendid reproduction of the above painting by Massani, in fourteen colors, without advertising, 17x25 inches in size, mailed on receipt at Orange, N. J., office of thirty cents in stamps or money order. Worth a place in any home.

Write for free booklet, "Home Entertainments with the Edison Phonograph," and name of the nearest dealer.

Indignant Time 590	LETTERS TO THE OUTLOOK 620

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

THE OUTLOOK COMPANY

Chicago Office, 1436 Marquette Building

287 Fourth Avenue, New York

Copyright, 1906, by the Outlook Company. Entered as second-class matter in the New York Post-Office.

ART LINENS

For Embroidery and Decorative Purposes

At "The Linen Store"

Registered Trade / lark

The reputation of "The Linen Store," for carrying in stock practically everything in Linen, applies with particular force to the Art Depart-

ment. The assortment of Art Linens is unquestionably wider and more comprehensive than can be obtained elsewhere.

It includes a full range of Irish and Austrian round thread linens for drawn work in widths ranging from sixteen to one hundred inches.

Russian, Siberian, Balkan, Flemish, Hessian

and Hand Loom Linen, 72 inches wide.

Etamines, Meteor, Hardanger and Aida Canvas, 48 inches wide.

Plain and Figured Damasks, 18 to 54 inches wide.

Colored Linens in a large variety of shades, including a complete line of College Colors, 36, 48 and 72 inches wide.

Craftsman Canvas and Goblin Linens, 50 inches wide.

In this department we also display a complete line of stamped goods, including the new designs for shadow embroidery and a very attractive collection of stamped shirt waists, corset covers, belts, collar and cuff sets.

Samples of any of the Art Fabrics sent free on request.

Mail orders have our prompt attention.

James McCutcheon & Co., 14 W. 23d St., New York

Intending purchasers of a strictly firstclass Piano should not fail to examthe ine merits of

It is the special favorite of the refined and cultured musical public on account of its unsurpassed tone-quality, unequaled durability, elegance of design and finish. Catalogue mailed on application.

The Anthracite Coal

A critical position in the negotiations between the anthra-

cite mine workers and the operators was reached at the beginning of this week when the reply of the operators to the demands of the miners was made public. This reply consisted of a positive and a sweeping refusal to accept the demands, with a counter-proposal on the part of the operators that the findings and awards of the Anthracite Coal Strike Commission—that is, the findings reached three years ago at the investigation called by President Roosevelt-which would naturally terminate on the first day of April next, should be continued. The operators say that they think the findings of the Anthracite Coal Strike Commission should establish practically permanent relations, and deprecate the disturbances to the public's business and comfort in the renewed negotiations. The main demands of the miners were for a written agreement for one year with the union, the eight-hour day, a uniform scale of wages throughout the anthracite regions, an increase of ten per cent. to men working under contract and an additional ten per cent. to allmen using safety lamps (our inference is that this is because the lamp is a badge of extra-dangerous work), the weighing of coal in all mines, with all payments on the basis of a ton of 2,240 pounds: the deduction by the owners of a certain percentage of each miner's wages to be paid into the union as his dues, and the abrogation of the Board of Conciliation. The conditions of the operators in opposition to these demands are briefly as follows: They stand unalterably for the open shop, and decline to deal with the United Mine Workers of America, which they characterize as "an organization controlled by a rival industry "-mean-

ing thereby the bituminous coal miners, who are in the majority in the National organization; the eight-hour day they consider impracticable because of the conditions of the work; they think that ten hours would be fair, but are willing to continue nine hours as fixed by the Commission, adding that the miners do not average eight hours a day now; a uniform scale of wages would mean, the operators say, higher prices for coal, and is impracticable by reason of differing capacity of workmen and varying conditions in the collieries, while they maintain that the employees now receive exceptionally high wages as compared to those paid employees in any like industry the world over; figures are quoted purporting to show that the contract miner is earning per year \$883.10, or \$443.72 more than in 1899; wages, the operators say, cannot be raised without raising the price to the consumer; as to the proposal to pay by the uniform weight basis of 2,240 pounds, the operators say that it is as proper to pay by measure as by weight, and that the Strike Commission decided against any change in this respect; the operators refuse to reserve from the workers' wages money to be paid into the unions, assert that the Board of Conciliation has not caused delay as claimed by the workers, and say that the decisions which were in favor of the men were promptly carried out; the sliding scale is defended as a guarantee to the men that they will share in any increase in price.

(20)

The Miners' Views

The full text of the formal reply of the officers of the anthracite miners' unions has not, so far as we find at this writing, been published in full. Mr. Mitchell, however, is quoted as saying that the

Digitized by Google

proposed increase of ten per cent. is justified by the general industrial, commercial, and trade conditions of the country; that the prosperity of the coalcarrying roads is unprecedented, and that, as the connection between the roads and the mine-owners is undisputed, the workmen in the mines should share in this: that an eight-hour work day has become the standard working day of all bituminous coal workers the world over, and that eight hours is as long as a man can work in a coal mine without injury to his health and consequent injury to society; that a uniform scale of wages for men performing the same work is needed to do away with discontent and is quite practicable; that paying for coal by weight is right because cars of different sizes are used, and when the car is made a unit of measure the introduction of cars of a new size makes friction in adjusting payments, while it is claimed by miners that whenever there is a difference of this kind they are the losers. Mr. Mitchell reiterates the assertions that the Board of Conciliation has resulted in serious delay in the adjustment of grievances, that some cases have been in the hands of the Board for two years, that rarely have cases been decided in less than three months, and that reconstruction of the Board is needed. it is still hoped that some basis of agreement will be found between operators and miners, and while this hope, as we write, is partly based on the fact that the United States Commissioner of Labor has been in conference with John Mitchell, the President of the United Mine Workers, and is thought to be urging conciliation on the part of President Roosevelt, it cannot be doubted that the present condition of the mining difficulty is in the highest degree serious. must not be forgotten that, as The Outlook has repeatedly urged, there are three parties to this controversy, and the interests of the third party, namely, the consumers of coal and the Nation at large, are of such magnitude that it ought to be impossible to cut off the supply of one of the necessities of life because of a disagreement as to wages and hours. In some way a reasonable method of settling disputes must be had.

There is a much Mine Labor Conditions broader aspect in West Virginia to the mine labor situation now confronting the operators and mine workers, not only of the softcoal fields of the Middle West, but also of the anthracite region of Pennsylvania, than the questions in dispute as to wages and conditions of employment. This broader aspect is of the most vital concern to the public. It has to do with the effects that mine labor conditions in West Virginia are having upon practically the entire coal industry of the country. The fact that about forty per cent. of the entire annual output of anthracite, or approximately twenty-five million short tons, comes in direct competition with bituminous coal through what are known to the trade as "steam sizes," lends emphasis to the statement that whatever tends to affect the price of soft coal reacts upon the prices of these small sizes of anthracite, as the two are in competition to meet the fuel demands of many of our industries. West Virginia coal, owing to the favorable geographical location of the deposits of that State and of its railway development, competes in both the Eastern and Lake markets: in the former with the steam sizes of anthracite as well as bituminous coal, and in the Lake markets principally with the bituminous product from western Pennsylvania, Ohio, Indiana, and Illinois. Under prevailing industrial conditions in the coal mines of West Virginia, by which the operators of that State are enabled not only to secure the cheap labor of negroes moving into that district from Southern States and of immigrants from the southeastern European countries, but also to benefit through various means of exploitation of labor, the labor cost of producing coal is much less in West Virginia than that of the operators in the Middle Western coalproducing States having a common market. The Middle Western coal operators, because their employees are strongly organized in the United Mine Workers of America, not only pay much higher wages than the West Virginia operators pay to their unorganized employees, but they have also abolished many if not all the various means of labor exploitation by

which the cost of production to the operator is greatly lessened. Among these methods of exploitation which prevail to a deplorable extent in West Virginia are the company store, excessive dockage, the large mine car, long hours of work (nine and in the great majority of cases ten hours a day in the mines), and systems and devices whose existence and operation redound to the advantage of the operator and to the disadvantage of the mine employee. Through such labor conditions the West Virginia operator to-day enjoys advantages in competition with the operator of the Middle West, upon whom the miners' union and public opinion have forced a higher standard of industrial morality in the treatment of employees, as we hope they will before long in West Virginia also.

Dissensions Among
Operators
and Mine Workers

In consequence of these conditions, operators of the Middle West are finding

themselves unable to meet the competition of the West Virginia operator. This tendency has been pointed out and a remedy for it urged in every Inter-State Joint Conference of the central competitive territory since the restoration of the trade agreement machinery in 1898. The operators of the Middle West not only have been losing their contracts with the railroads and industrial plants, but even their domestic markets are being taken away from them by the West Virginia product. The operators represented in the joint conferences have made repeated demands upon the United Mine Workers, and this organization has made repeated attempts to organize West Virginia miners sufficiently to bring them and their employers within the jurisdiction of the Inter-State Joint Conference; but, through the operation of welldefined causes, these attempts have so far failed. It is clearly understood by both operators and mine workers participating in the Inter-State Joint Conference that unless West Virginia is brought within the jurisdiction of the Conference's trade agreement the entire movement is in danger of going to pieces

at almost any time. This means that so long as present industrial and labor conditions are permitted to continue in West Virginia the coal-consuming public will have impending over it at all times the possibility of a widespread industrial war, as the mine workers of the Middle West and of the anthracite region will never surrender the comparatively high wages and the fair standard of living to which their union has made them accustomed, until they are forced to it through the failure of a strike. The prevailing conditions in West Virginia are reflected in the failure of the recent conferences of operators to arrive at a harmonious understanding as to their action and policy in the coming Indianapolis convention. The newspaper accounts of all these meetings show a clearly marked division among the operators, some of them favoring the compromise proposition of a five and one-half per cent, increase in wages to the mine workers and the others vigorously opposing any increase, the latter claiming that under present competitive conditions they cannot afford to increase wages and at the same time continue in business. The operators who favor the compromise proposition are the large concerns, like the Pittsburg Coal Company, which have long-term contracts for practically all of their output with big industrial concerns such as the United States Steel Corporation, while the opponents to the wage increase are the operators who must sell their coal on short-term contracts in markets where competition is most severe. Under these industrial and business conditions, even if a strike of the mine workers is averted on April 1, it is only postponing the day when this question of West Virginia competition in the coal markets of the country will force upon the Nation the necessity of a solution to the industrial conditions in that State which give to this competition its strength. Not only can the dissension among the operators be traced to this competition, but it is also largely responsible for the break within the ranks of the mine workers themselves, which was referred to in The Outlook of February 24, for those who oppose the strike policy point out the weakness of the union because unorganized West Virginia mines would capture still more markets in case of a strike. The dissension in District 5 (western Pennsylvania) has resulted in the removal from their respective offices by the district convention of President Dolan and Vice-President Bellingham, and the appointment by the National President of the United Mine Workers of a committee to take charge of the executive offices of the district until another election is held, for which provisions have already been made. President Dolan threatens legal proceedings to retain possession of his office until March, 1907, for which term he claims to have been properly elected.

***** :

In returning to Congress For a Thorough with his signature the Investigation joint resolution lately passed by both its branches providing for an investigation by the Inter-State Commerce Commission into the subjects of monopolies in coal and oil and railway discrimination, President Roosevelt sent a special message in which he pointed out that such an investigation, if not thorough and practical in form and method, would be worse than none at all, as it might be regarded as an evidence of insincerity. The President states that it was with hesitation that he signed the resolution, because of his fear that the form in which it was cast might make it ineffective. The defect pointed out may, he thinks, be remedied by legislation, and the intention of his message is to ask for such legislation. It must be remembered that investigations are already being carried on both as to coal and oil by the Department of Commerce and Labor, and care must be taken that the inquiry which the Inter-State Commerce Commission is now asked to make does not conflict with the other, and the two, as the President says, render each other more or less nugatory. It might also result from the fact that immunity from prosecution must be given to all witnesses that criminal prosecution, now at least possible, might be entirely prevented. While investigation and the resulting enlightenment of the public

may conceivably be even more important than prosecution, the choice between the two should be made deliberately and not thoughtlessly be forced by conflicting efforts. The President hopes that Congress will so amend the resolution that the Inter-State Commerce Commission should be furnished with money and power to make the inquiry searching and thorough. At present it has no sufficient sum of money to enable it to do the additional work thus put upon it, and it is even doubtful whether under this resolution as originally passed it could administer oaths or compel the attendance of witnesses. These suggestions of the President can hardly fail to impress upon Congress the necessity of acting with vigor and clear-sightedness if it is to act at all in this important matter.

(2)

The bill which passed The Statehood the Senate last week dif-Bill fers so radically from that which passed the House not long ago as to be a totally new measure. The Senate bill provides only for the admission of one State, to be called the State of Oklahoma, and to comprise the Territory now bearing that name, together with the adjoining Indian Territory. The House, as our readers know, had joined to this the admission of Arizona and New Mexico united into one State, and it had been thought that the contest in the Senate would certer upon the question as to whether each of the four present Territories involved should be allowed to express its opinion as to joint Statehood by vote. The Foraker amendment, providing for this plebiscite, was carried by a large majority, and then, somewhat to the surprise of the Senate itself, an amendment offered by Senator Burrows striking out all reference to Arizona and New Mexico was carried by a majority of twotwelve Republican Senators joining with the Democrats. The House and the Senate are now so far apart in this matter that political prophets think the probability small that they can come together in the conference of committees which must now be held. The vote in the Senate indicates, it seems to The Outlook, increasing adherence to the general propositions laid down in our editorial comment of last week; namely, that Congress has a right to determine when and how States shall be admitted, and with the interest of the Nation as well as of the Territories concerned in view, but that no Territory should be converted into a State or a part of a State against the will of its people. It may be added that, whatever political expediency may seem to demand, a Territory well fitted for Statehood and desiring Statehood should not be excluded for partisan political reasons.

€

Free Alcohol for Use in the Arts and Manufactures The Ways and Means Committee of the House of Representa-

tives has had under consideration for some time several bills providing for the removal of the tax on denatured alcohol for use in the arts and manufactures. Denatured alcohol is alcohol which has been rendered unfit for drinking by the addition of substances which are poisonous to a certain extent or offensive to smell and taste and revolting to the stomach. Many processes of denaturing are in use in other countries, and it is practically undisputed that alcohol can be so treated, without impairing its efficiency as a fuel, an illuminant, or a solvent, that it will be undrinkable by any except degenerates. It must be remembered that there are two kinds of alcohol in general use—ethyl or grain alcohol, which is found in intoxicating beverages, and methyl or wood alcohol, which is poisonous. Grain alcohol pays an internal revenue tax of \$2.20 per gallon on the pure spirit, while wood alcohol is untaxed. Denatured alcohol is free from taxation in Great Britain. Germany, France, and nine other European countries, and in Cuba and five countries in South America. It is argued in favor of free denatured alcohol that, judging from the experience in those countries, it would add to the prosperity of many industries using alcohol in their manufacturing processes, would make possible the establishment of other industries in which cheap grain alcohol is a

necessity, and would afford a cheaper and more satisfactory material than any now available for motors of various kinds, and for heating and lighting under certain conditions. At the hearing before the Committee the Secretary of Agriculture and the Master of the National Grange of the Patrons of Husbandry presented the advantages to the farmers of the country from the removal of the tax. It is argued that alcohol, burned in suitable lamps, is a better illuminant than kerosene, that it can be used for heating and cooking and as a fuel for the motors which the farmers are using to a greater and greater extent for baling hay, shelling corn, sawing wood, threshing, churning, pumping water, and running all kinds of farm machinery, much more safely than gasoline and probably more cheaply. The supply of gasoline is limited, and the steadily increasing demand for it is rapidly raising the price. Grain alcohol can be made from all the plants that contain large quantities of starch and sugar. Corn, including the stalks, potatoes, sweet potatoes, waste molasses from the sugarcane and the sugar beet, are all available sources of alcohol, and the farmers, by the establishment of central distilling plants in each section, would be able to dispose of quantities of products which are now waste or unprofitable. The farmers would benefit doubly, by an increased demand for what they raise, and by an abundant and cheap supply of a valuable material for light, heat, and power.

The main objections to **Objections** the removal of the tax to Free Alcohol are made by the manufacturers of methyl or wood alcohol. They contend that the expectation of a wide increase in the use of grain alcohol for lighting, heating, and running motors would not be realized, and that the chief use of the denatured product would be in those industries where wood alcohol is now employed; though they acknowledge that it would displace the wood alcohol because it can do the work as well and in many cases better, is more pleasant to use, and would be cheaper.

The wood alcohol makers claim that

such a decrease in the demand as would result would destroy their business; while the benefits would be felt only by the classes of industries now using wood alcohol. In reply to this argument it is said that there will be a considerable demand for wood alcohol for use in denaturing grain alcohol, and that the expected increased consumption of denatured alcohol would in a short time call for as much wood alcohol as is now manufactured. It seems to be well established also that the employment of methyl alcohol in any industry where the work is conducted in confined quarters is injurious to health, sometimes resulting in complete or partial blind-The question has been raised whether, by the removal of the tax on denatured alcohol, encouragement would not be given to the attempt to recover pure grain alcohol from the denatured product and thus the public health be menaced and the Government treasury defrauded. To us the weight of evidence seems to be on the side of those who deny that, under proper regulation, any such evil would follow the removal of the tax. The arguments of the manufacturers of wood alcohol should receive consideration. If it seems probable, however, that the expected advantages will accrue to many industries and to the farmers, Congress ought not to continue a tax for the protection of a single industry

(

A very interesting An Election Reform and suggestive con-Conference ference for the consideration of election reforms was held in New York on March 6 and 7, under the auspices of the National Civic Federation. Mr. Oscar S. Straus, President of the Federation and of the National Primary League, opened the sessions with an able address on "Reform of the Primaries and Election League." Ballot and primary laws and corrupt practices were the three principal topics under consideration. Both sides of each question were set forth by capable representatives. The discussion of the Wisconsin law was particularly interesting. Mr. I. L. Lenroot, Speaker of the Wis

consin lower House, spoke in favor of the La Follette law, and Collector Monaghan, an adherent of Senator Spooner, against. Mr. Lenroot advanced the usual arguments in favor of direct primaries. Mr. Monaghan declared that the present system in Wisconsin practically deprived the farmer of any vote in either county or State affairs because of its cumbersome provisions; it compels the candidate to make two campaigns to secure office, and forces him to waste unnecessary time, and money which many cannot afford; and the plurality vote nominates. Again, Mr. Monaghan thought that one of the strongest objections was that Wisconsin will have a candidate platform instead of a people's platform. He claimed that this was getting near to the people with a vengeance, and was one of the lamest provisions of this wholly bad law. Congressman Bennett, who followed Mr. Monaghan, took occasion to say that all of the objections which Mr. Monaghan had urged against the direct primaries system could be urged with equal force against the convention system, and he illustrated his points from his own experience. He pointed out how one man in a constituency of two hundred and ninety thousand was the dominating factor in nominations. discussion of the Australian ballot was most illuminating, Josiah Quincy and Richard H. Dana defending the Massachusetts ballot with great force and effect. To the chief objection to the Australian system, that it resulted in a great falling off in the vote between the head of the ticket and the other candidates on the ticket, Mr. Quincy replied that a large percentage of the voters do not exercise the right of suffrage. If four out of five registered voters go to the polls, it is considered a big vote. Why should not four-fifths of the people have the right to vote for what officers they please if one-fifth are permitted to stay at home? Mr. Dana made an equally effective reply, showing that very often the large vote was for some office about which there was a particular fight and in which there was special interest, thus indicating that people voted for the offices in which they were specially interested and declined to express a preference where

they were uninformed or uninterested. One of the most striking addresses on corrupt practices legislation was from the leader of the Conservative party in the Canadian Parliament. The resolutions adopted at the conclusion of the Conference declared in favor of the establishment of a permanent department of the National Civic Federation to take jurisdiction of the subjects which the Conference was called to consider: it also declared that experience shows that existing provisions of criminal law against the purchase of votes are inadequate, and that proper corrupt practices legislation should include:

The publication of all contributions and expenditures.

The prohibition of political contributions

by corporations.

The definition and limitation of permissible

political expenditures.

Provisions for judicial inquiry into election expenditures and existence of corrupt practices, in which proceedings any citizen may participate.

The punishment of corrupt practices by further penalties, such as disfranchisement or disqualification for office, in addition to fine or imprisonment.

The bills introduced in

Criticising the the New York Legisla-Insurance Bills ture by the Armstrong Investigating Committee were discussed at a public hearing last Friday by representatives of the insurance companies. The presidents of the three great companies, Mr. Paul Morton, of the Equitable, Mr. Alexander E. Orr, of the New York Life, and Mr. Charles A. Peabody, of the Mutual, the actuaries of these companies, representatives of the smaller companies and of the life insurance agents of the State, presented criticisms and suggestions. With practical unanimity the speakers, highly commended the work of the Committee, and expressed themselves as in accord with the spirit and general tendency of its recommendations. Their criticisms, however, covered pretty thoroughly the various bills, and when the hearing was over few of the provisions had not been attacked. Publicity of accounting was heartily approved by many of the speakers, and the opinion seemed to be general that it would prevent practically all

the evils and render unnecessary specific limitations of management. The prohibition of campaign contributions, the regulation of lobbying, and the provisions for giving the policy-holders in mutual companies greater opportunities for participation in their control were passed over in silence, although we understand that the last subject has been reserved for consideration at another hearing. The provision for the limitation of the amount of new business which a company may write annually was agreed to, with a suggested amendment postponing its operation for a few years, thus giving the companies time to adjust themselves to the new conditions. The limit proposed for the largest companies is about half the amount of the business written by the New York Life Insurance Company last year; to enforce that limit at once would, the large companies assert, disorganize their agency systems and entail considerable loss. Mr. Morton presented a modification of the Committee's plan for the restriction of investments which he believed would accomplish the desired result and at the same time save the policy-holders a great deal of money. Instead of forbidding the ownership by life insurance companies of the stock of other corporations and of bonds secured by stock, he would permit them to retain their present investments, with the exception that no company should hold over twenty per cent, of the stock of a bank or trust company. In the future he would permit investments in the stocks of railroads which have maintained a certain record in dividend-paying, and in collateral trust bonds issued by companies operating railroads which have not defaulted in their interest-paying for a number of years. The abolition of the deferred dividend form of policy was opposed by the insurance companies on the ground that there is a large and legitimate demand for it, that the policy-holder should be allowed freedom to select whatever kind of contract he prefers, and that by this form of policy many men are induced to insure their lives who would not otherwise do so, thereby increasing the number of families having protection. It was argued further that

the deferred dividend plan afforded a perfectly proper reward for, and incentive to, persistence in payment of premiums. The provision for the maintenance of a contingency reserve fund not to exceed a specified maximum and for the annual distribution of all the surplus over and above this fund was also opposed. was claimed that the maximum fixed by the Committee was entirely too low, and that the officials of the companies should be allowed to use their discretion in the laying aside of a fund as a protection against fluctuations in the price of securities and other unforeseen contingencies. It was contended that if the entire surplus must be distributed annually, the variation in the policy-holder's dividends from year to year which must inevitably result would lead to dissatisfaction and would tend greatly to increase the lapsing of policies. The provision of the bills which aroused the greatest opposition was that limiting the amount which might be spent each year in obtaining new business. It was urged that the provision was unworkable; the bill makes no statement of just what expenses shall be included in this category, and, even if they were carefully defined, it would be impossible for the officials of the company to determine at the beginning of the year how much new business they would obtain and therefore how much they might spend in obtaining that business. The limit set by the Committee was protested against, also, because it was so low as to make it practically impossible for the average agent to make a living on that basis. The life insurance representatives were listened to with the closest attention by the members of the Committee, with the evident desire of obtaining the most light possible on the great problem which they have been working on with such energy and fidelity. There seems little reason to doubt that the legislation as finally shaped by the Committee will be, on the whole, sane, equitable, and thorough.

The Battle in Jolo

The engagement of MajorGeneral Wood's forces with a band of hostile

Moros on Tuesday and Wednesday of last week is sufficiently important to mark

it as the most serious military operation in the Philippines since the collapse of the general insurrectionary movement. But it must be carefully distinguished from that movement, with which it has no connection, direct or indirect. It has long been recognized by all who are in the least conversant with the situation in the Philippines that the government of the Moros or Mohammedans in the southern islands is a question entirely by itself. In so far as these people resist and defy American authority, it is not at all from any sympathy with Aguinaldo's former organized resistance—and, indeed, the Moros bitterly hate the Filipinos, properly so called, who differ from them in race, religion, and customs. A sentence in General Wood's report gives concisely the actual facts as to this armed resistance: "The action resulted in the extinction of a band of outlaws who, recognizing no chief, had been raiding friendly Moros, and owing to their defiance of the American authorities had stirred up a dangerous condition of affairs." The Sultan of Jolo has expressed his approval of the extermination of this band of outlaws. General Corbin in his comment about this fight says:

This encounter has no bearing on the Philippines situation. The Moros are religious fanatics, and are not amenable to the influences of other peoples. They owe no allegiance except to their Mohammedan faith, and are liable to cause trouble at any time. Their acts have no more relation to the conduct of the Filipinos than the Apache outbreaks in former days in Arizona with the situation in other States and Territories.

From the military point of view the battle possessed considerable interest because of the strong intrenchment of the Moros in the crater of a lava-cone over two thousand feet high, at the top of Mount Dajo. Such a position, the approaches to which were strengthened by the natural defenses of heavy timber, and further made difficult by the extremely steep slope of the mountain, might well seem impregnable to these fierce Moros, and would be impregnable to any kind of an attack they had known of among themselves. General Wood, however, caused a number of guns to be lifted by block and tackle to a position three hundred feet high, where they

commanded the crater. The detachments of infantry and of the naval contingent which operated with the army advanced under cover of the fire of the guns, and, although the resistance was stubborn, the result was the capture of the position, with a loss on our part of fifteen men killed and about sixty-five officers and men wounded. The scene of the fight was a precipitous volcanic hill about five miles from the town of Iolo—the War Department seems to prefer the spelling Jolo to that of Sulu for the island, town, and group of islands to which the two names are rather indiscriminately applied. The loss to the Moros was about six hundred killed. This includes, it is reported, many women and children who were held by the Moros in their stronghold. The disparity in the losses of the two forces is a significant illustration of the inequality between an army with antiquated arms and insufficient training in an almost perfectly defended position and an army with arms of precision and military science compelled to attack a seemingly impregnable fort. It is generally believed that the defeat of these insurgent Moros will make unlikely any further combined resistance to American authority in the Jolo Archipelago, although there will probably continue to be more or less turbulence from time to time because of the fierce jealousy and warlike habits of the bands of semi-brigands, held together by rival chiefs, or dattos, who sometimes fight among themselves and sometimes resent the authority of the Sultan or of the Americans.

6

Perhaps the most remark-The British able feature of the recent Labor Party British elections was the birth of a new political party. For a long time such labor leaders as Messrs. John Burns and Keir Hardie had exercised a strong influence both in and out of Parliament, but only with the present year may a definite, numerous, and weighty labor delegation in Parliament be said to have come into being. Judging from last month's record, its fifty-four members are likely to have a distinct voice in the framing of new legislation.

In almost the first debate in Parliament the subject of old-age pensions came up, and members of the House of Commons listened with keen interest to the maiden speeches of some of the Laborites: with a specially intelligent attention, indeed, because of the report which had just been published on that subject from Mr. Burns, now President of the Local Government Board in the new Cabinet. Out of a total of about 884,000 persons receiving Poor Law relief last year, about 340,000 were over sixty years old; the deduction being that the introduction of a system of old-age pensions would not drain the public pocket as much as sup-This subject had been well discussed during the elections; indeed, Mr. Hardie declares that probably not onetenth of the Liberal members won their seats without making more or less definite promises in regard to old-age pensions. Shortly after the opening of Parliament Sir Henry Campbell-Bannerman, the new Prime Minister, received a deputation urging this reform from the Parliamentary Committee of the Trade Union Congress. While assuring the deputation of his full sympathy, Sir Henry urged that there was no money with which to pay pensions; however, if a little less ambitious policy were pursued (doubtless referring to the policy of his predecessors), it would be possible to find money for so beneficent a purpose. Mr. Hardie declared that the excuse of no money had been made twelve years ago; that in the interval the Government's expenditure had advanced by nearly forty million pounds (\$200,000,000) a year, half of which went in "wasteful expenditure on the army and navy." The total extra cost of providing pensions for the aged poor is estimated at from fifty million to sixty million dollars. Since 1895, however, protested Mr. Hardie, fifteen hundred million dollars has been "squandered on a war which did no one good except the contractors." However men may differ as to the necessity of the Boer War, there is no question, we suppose, that the expenditure of huge sums for military purposes is only embittering the Laborites the more in their struggle for legislation on such humaner subjects as old-age pensions, better compensation

and cheap trains for workmen, closer inspection of factories and railway cars, and a new definition of the rights of trade unions.

(B)

On no subject, however, has **Education** the action of the Labor in England party been more marked than on that of education. At the annual Labor Conference, held February 15, the Education Act of 1902 was condemned, and demands were put forth for equal opportunities for all; that all grades of education should be free and State-maintained; that education in all State-supported schools should be secular; that at least one free meal per day should be given to all school-children. This programme seems more like public school education as we understand it in America. Though the recent Education Act of 1902 co-ordinated the English educational scheme by uniting the Board schools with the Voluntary schools, by a system which seeks to reconcile the claims of State and Church as represented by those schools, the claims of the Church have received, not only according to Nonconformists, but also according to many Anglican Churchmen, an undue preference. Canon Henson is a good representative of those liberal churchmen. He truly declares that the lower and lower-middle classes, who are directly interested in the elementary schools to which they send their children, are, in the main, undenominational in the sense that they regard denominational claims as of minor importance; that they have never supported the denominational schools, which have been provided and managed without their consent; but that they are strongly attached to the religion of the New Testament, and desire that their children should be taught it in the schools. Hence, it has been proposed by the Liberal leaders, with the support of some Laborites, that the Government should, first, abolish all religious tests for teachers, and, second, provide a common form for Christian teaching to be taught in all the schools. The Laborites, who support this plan, are also insistent that the Government shall not sanction the compromise urged upon it—namely, to provide facilities for dogmatic instruction for half an hour before the opening of the school proper. This latter position was recently succinctly put by the Bishop of Birmingham, when he declared that—

Undenominationism means either that each schoolmaster shall teach what religious belief he pleases in giving Bible classes, or that the State authority in education shall formulate some sort of standard representing what is believed to be our common Christianity and cause it to be taught. Neither of those alternatives appears to us as tolerable. I use the word strictly. We believe that there is, in the present condition of religious opinion among us, only one tolerable principle; that is, that the parents shall be invited to determine what kind of religious teaching they wish to be given to their children, and by what kind of teachers they wish it to be given, and that the State should impartially facilitate the teaching of religion chosen by the parents.

It remains to be seen whether Canon Henson or the Bishop of Birmingham exhibits the juster sense of proportion. The average American's sympathies will lie, we believe, with the former.

@

Last week, after holding The French office a little over a year, Cabinet the French Ministry resigned. The ostensible cause was a fortuitous coming together, in a vote of noconfidence, of Clericals and Socialists. The first blamed Premier Rouvier because he had so drastically applied the provision of the law requiring an inventory of churches; the second, because he had not applied it drastically enough. M. Rouvier's resignation might of course have been avoided had he listened to the counsels of the extreme Radicals. He correctly declares that he has fallen between two stools, that if he had enforced the inventory provision more immediately, unfeelingly, and with less regard for the particular sentiments of the various communities affected, he would have polled a handsome Ministerial majority. Apparently he pays dearly for his wisdom by the opposition to him at a supposed critical moment in French foreign relations not only of his enemies, the Clericals, but of his presumable friends, the Socialists, who have now given another proof of a political irre-

sponsibility which hardly attaches to German Socialists. The Cabinet crisis occurred, apparently, at a critical time, if the Moroccan Conference had not really reached a practical conclusion, and if Church manifestants were not to be checked. The Rouvier Ministry tendered its resignation when M. Fallières was inaugurated President last month, but, at the request of the new President, remained in office. Its departure from office will call forth regret, not only from many Frenchmen, but also from many observers and friends outside France. The manner of its going, however, will only enhance M. Rouvier's reputation as a statesman. On Monday of this week it was announced that M. Jean Marie Ferdinand Sarrien had definitely succeeded in the task of forming a Ministry. The new Premier's name and that of M. Léon Bourgeois, who is to be Foreign Minister, are guarantees that the incoming Ministry will continue its predecessor's praiseworthy policy toward Morocco, Germany, the Vatican, and most important of all—towards England.

1

Baron von Sternburg on Morocco Last week Baron Speck von Sternburg, German Am-

bassador at Washington, emphatically denied the charge that by the Conference at Algeciras, Spain, the German Emperor is seeking an excuse for trouble with France rather than an agreement about The Ambassador declared Morocco. that Germany urged a conference at Algeciras for the specific object of reaching a peaceable arrangement; her policy has been and is to preserve the status quo in all countries whose rights rest on the laws of nations. Speaking to a representative of The Outlook, the Ambassador said: "This object explains the Kaiser's policy, to which Germany owes her sound development during long years of peace. It marks the different lines which France and Germany are following at Algeciras, the one tending to guard the signatory Powers of the Treaty of Madrid and the open door in trade, the other to turn Morocco into a French protectorate." Concerning the main points at issue—an international

police system and an international bank for Morocco-France naturally claims a preferential position because of the length of her Algerian frontier, despite the provision of the Treaty of Madrid stipulating that all the Powers shall have equal rights in Morocco. Germany, on the other hand, while acknowledging the special interests of France, insists upon these equal rights. As to the bank, France claims control because of her preponderant interest in Morocco's previous loans; Germany replies that if France obtains control, equal economic rights will be forfeited. The German position is apparently that peace should not be bought at the sacrifice of an international principle; as Baron von Sternburg says, the greatest good to the greatest number is a law among nations as among individuals, and in this particular case the acceptance of the French proposals with regard to the bank and the police would confer upon France the control of Morocco economically and financially, thereby closing the door to the rest of the world. "What Germany is now working for in Algeciras," added the Ambassador, "is nothing more than to place the two vital questions—police and bank—under international control. I am sure that as soon as that is sufficiently guaranteed, she will consider her task fulfilled." From the events of the past week, however, both France and Germany may claim a victory. The Conference as a whole recognizes the special interests of France, but by insisting on the open door prevents her from repeating the commercial policy she pursued in Tunis and Madagascar.

The Russian Duma

Last week an Imperial manifesto was published setting forth decisions in regard to the carrying out of the Czar's manifesto of October 30 last. It is provided that the two bodies which are to compose the Russian Parliament, the Council of the Empire and the Duma, or National Assembly, shall be convoked and prorogued annually by Imperial ukase. Both Parliamentary bodies are to have equal legislative powers in initiating legislation and in other matters,

Both bodies may annul the election of any of their members. Ministers are to be eligible to election to the Duma. sessions of both the Duma and the Council of the Empire are to be public. closure of a debate may be voted by a majority. Laws voted by the two bodies are to be submitted for Imperial sanction by the President of the Council of the Empire. The members of both bodies are to be immune from arrest during the session, except by permission of the bodies to which they belong, unless guilty of flagrant offenses. Only bills passed by both bodies may be submitted for the Emperor's sanction. Bills rejected by the Emperor may not be brought forward again in the course of the same session of Parliament. Bills rejected by one of the legislative bodies will require Imperial assent before being reintroduced. During suspension of the sittings of the Duma, or National Assembly, the Council of Ministers (should extraordinary circumstances arise calling for legislative action) may refer to the Emperor for his decision such measures as do not involve a change in the fundamental laws of the Empire. The power of such a law ceases, however, if, two months after the Duma has resumed its sittings, no bill embodying the provisions contained in the act is brought forward, or if such bill has been rejected by either Parliamentary body.

●

The Council of the Empire The Russian is to consist of an equal Council number of elected members and members nominated by the Emperor. Each zemstvo is privileged to elect a member; six members are to be returned by the Synod of the Orthodox Church, six by the Academy of Sciences and Universities, twelve by the Bourses of Commerce and Industry, eighteen by the nobility, and six by the landed proprietors of Poland. All the members of the Council must be over forty years old and baccalaureates. The President and Vice-President will be appointed by the Emperor. Elective members will receive \$12.50 daily during the session. The consideration of the following subjects is intrusted to members of the Council all of whom are to be appointed solely by the Crown:

1. Reports of the Minister of Finance upon

the state of the Treasury.

2. Charges of malfeasance against members of the Council of the Empire, Ministers, Governors-General, and Commanders-in-Chief of land or sea forces.

3. The establishment of stock companies

with special privileges.

4. Questions relating to entailed estates and titles of nobility.

These provisions abundantly indicate the Government's purpose to keep a firm check on Parliament in general, and especially by the composition of the Council—with one-half appointed by the Czar and twenty-four members elected from the nobility and clergy—to insure a conservative majority in the Council to block the Duma or National Assembly should the latter oppose the Crown. But perhaps, after all, these restrictions are relatively small when we consider that for the first time in Russian history an arena of free discussion has finally been opened.

3

The indorsement and The Consumers' vigorous promotion of League five bills now pending before Congress constituted the novel feature of the seventh annual meeting of the National Consumers' League recently held at Boston. These bills affect the welfare of wage-earning women and children, and also the conscience and well-being of the consumers who are indirectly their employers. With sixty active branches in twenty States and a fresh record of valuable assistance rendered in urging the passage of the Pure Food Bill in the Senate, the National Consumers' League proposes to add a campaign for Federal legislation to the efforts (which it will continue as before through the State and local leagues) on behalf of the workers in the sweated trades and in stores. Of the five bills thus indorsed and taken up for promotion, the Hepburn Pure Food Bill now before the House of Representatives is the only one which has passed either branch of Congress. The others provide for: The regulation of child labor in the District of Columbia; compulsory education in the District of Columbia; a Children's Bureau;

and an investigation of the labor of women and children throughout the United States. The bills providing for compulsory education and regulating child labor in the District of Columbia failed to pass when introduced at the short session, and are now before Congress for the second time. The proposed Children's Bureau would do for our future citizens what the Government has long done for the forests, the navigable rivers, the Indians, the crops, and many other interests; viz., furnish trustworthy current information concerning them as a basis for State and municipal action. A single point may illustrate the need. There has never been any comprehensive study of orphanage from the point of view of preventing destruction of life of able-bodied fathers of young families on railroads, in mines, quarries, powder-mills, etc. Yet a hardworked argument in favor of child labor is the possible starvation of fatherless children if prevented from working. The Children's Bureau would be in a position to furnish all the facts necessary to enlightened legislation on these interrelated subjects. The investigation of wage-earning women would carry out the recommendation of President Roosevelt in his recent Message. This bill has been reported favorably by the Committee on Labor, and an item providing \$250,000 for meeting the expense has been included in the appropriation bill at the request of Mr. Victor Metcalf, Commissioner of Labor. In order to deal with the now National problem of workingwomen, investigation on a National scale is needed. It is to obtain this, as well as the continuous investigation of all the circumstances shaping the lives of child workers, that the National Consumers' League has committed itself, voicing the great body of consumers, the ultimate employers and the ultimate lawmakers.

Christian Socialism in Ohio

Toledo, Ohio, which, though it caused no stir in the city and passed almost unnoticed by the rest of the State, was not without significance

in the religious development of the Na-

tion. It was the State Convention of the Young Men's Christian Association. During the sessions there was very little of the stereotyped phrase, the trite exhortation, and the solemn discussion of devices as if they were principles; instead there was a very earnest and, on the whole, intelligent attempt to understand the duty of the Association toward the pressing social problems of the day. Instead of the old question, How can we rescue more individuals from an evil world? the question was, How can we get at the evils of the world itself and cure them? A large part of the sessions was thus devoted to a discussion of the place the Association can have in making municipal government sounder and more Christian in spirit. The resolutions adopted indicate the spirit of the Convention. They assert that "the Associations as a rule have taken no sufficient part in the investigation of social conditions," and recommend that "each association, through some department already organized, or by some special committee, make a thorough study of social conditions in its own locality, and propose some definite workable scheme for making our associations in fact Christian Associations as well as associations of Christians." Several of the speakers were not actively engaged in Association work. Among them was ex-Governor Montague, of Virginia. This Convention indicates the progressive character of the Associations of Ohio and the direction in which the Associations throughout the country are likely to develop.

The Chicago City Saloon License Made Council last week \$1,000 in Chicago voted to double the saloon license fee, making the rate \$1,000 instead of \$500. This action was the result of a short but aggressive campaign which aroused the community as it has not been aroused before for years on any phase of the saloon question. Chicago's revenues are deficient, in consequence of which the police force is inadequate in numbers. Within the last two or three months there has been an unusually large number of murders and other crimes of violence. A larger police

force was recognized in all quarters to be imperatively necessary. An ordinance was introduced into the City Council raising the saloon license fee to \$1,000 as the best means of providing the needed police increase. The liquor interests proposed as a compromise that the fee be raised from \$500 to \$600. When the vote was first taken in the Council about three weeks ago, the high license measure was defeated by a very narrow margin. The fight was at once renewed, and resulted in victory for the \$1,000 ordinance. In New York City the saloon license fee is \$1,200. In Philadelphia and Pittsburg it is \$1,100. In Boston the rate varies from \$500 to \$2,000. The higher license fee in these cities was cited as an argument for the increase proposed in Chicago. But a fact which makes the Chicago victory notable in comparison with the other cities mentioned is that in New York and the other cities the high license rate was imposed by the State Legislature, while in Chicago it was the City Council, responsible solely to the local cosmopolitan constituency, in which the liquor interests are very powerful, that voted the increase. fact is full of significance as to the improvement which is taking place in our Ten years ago the Chicago City Council would have voted down overwhelmingly any proposition seriously opposed by the saloon interests. the progressive movement of the past ten years in Chicago has not been an anti-saloon movement, nevertheless the improvement wrought makes it possible, when an issue is raised between the people as a whole and the saloon interests as a class, for the people to dominate and override the protests of the class.

A Fair Hearing for American Compositions As its name is intended to indicate, the New Music Society of America is organized to pro-

duce in public "new music" composed by Americans. The first concert of the Society was given in Carnegie Hall last Saturday by the Russian Symphony Orchestra, under the direction of Modest Altschuler. The music that was really new on the programme was a "dramatic

scene" for soprano and orchestra by H. F. Gilbert, and the composition which won the Paderewski prize last year, entitled "Overture Joyeuse," by Arthur Shepherd. Each in its way exhibited the incoherence that seems to be the characteristic defect of the work of the younger writers for the orchestra at the present; and neither had, as a whole, that quality of freshness and convincing artistic sincerity which saves some modern compositions equally incoherent. The two works of Edward MacDowell which were performed furnished the really valuable and beautiful parts of the concert. Both of these, however, the Second Indian Suite and the Second Piano Concerto, have been performed adequately several times in this country. Ruth Lynda Déyo, a pupil of MacDowell's, gave to the concerto a sympathetic if somewhat too vigorous interpretation. Although the purpose of the Society was very meagerly expressed in this concert, it is one that is not without justification. The fact that almost all the orchestral performers and conductors in this country are foreigners has given to music in America a cosmopolitan quality; but it has to some degree tended to put native composers at a disadvantage. undertaking of the New Music Society to remove in some measure the natural handicap of the American composer deserves a fair trial.

The Present Condition of Labor in England

The Royal Commission on English Trade Disputes has just issued its report. The Commission was formed over two and a half years ago. Its Chairman is Lord Dunedin, President of the Court of Session, and a great Conservative lawyer. Its members are Sir Godfrey Lushington, formerly of the Home Office; Sir William Lewis, representing the South Wales coal owners; the Right Hon. Arthur Cohen, a distinguished Liberal lawyer; and Mr. Sidney Webb, the eminent economist, and long the chief literary champion of trades union-But even with such a protagonist on the Commission as Mr. Webb the trade unions declined to give evidence before it. Fortunately, this abstention was not such a serious hindrance as it might seem, the contentions of trade unionists having previously been thoroughly considered. The Commission evidently spared no pains in investigating actual conditions, and the concurrence of opinion on principal points at issue of the types of men represented by the Commissioners is a striking commentary on the judicial quality and sagacity of their report.

Before 1871 English trade unions were regarded purely as an aggregation of individuals; a suit at law could be instituted only against members individually. In 1871 trade unions were legalized; they had the power to sue, but they were not free from the liability to be sued, provided the proper machinery could be discovered. Trade unionists claimed the right of exemption because of the difficulties of practice. For a long time, therefore, the great labor questions in England were: Can trade unions be sued? Is it or is it not to the public advantage for the funds of trade unions to be liable for payment in damages? Finally, in the Taff-Vale case, the House of Lords, sitting as a court, decided that a registered trade union could be sued under its registered name. The practical immunity enjoyed by English trades unions was ended. It is interesting to note the unanimous vote of the present Commission that the principle of the Taff-Vale decision was equitable and right and ought to be retained, first, because "there is no rule of law so elementary, so universal, or so indispensable as the rule that a wrong-doer should be made to redress his wrong;" and, second, because, since the decision, trade disputes have been less frequent, better conducted, and more easily set-Thus, concerning the liability of trade union funds for payment in damages, the Commissioners unanimously condemn the contention that the trades union should be able to do wrong by means of these funds, and yet not be bound to compensate its victims:

The notion of a trade union having been intended to be specially exempted from actions of tort is a mere misconception, resting

on no other foundation than long practical immunity, which was simply the result of defects in general legal procedure that have now been remedied on general considerations of equity.

A second opinion by the Commission concerns not a general legal liability, but the particular law of agency. Should the funds of a union be taken in execution for its branch agents' wrongful acts? Most of the Commissioners recommend that the central trade union authorities should be protected against the unauthorized but immediately disavowed acts of branch agents—a reasonable proposal, say some critics, quoting the similar New South Wales law of 1903; unreasonable, say others, because such liability is not lessened in the cases of other companies or partnerships: if branch officials do unauthorized acts. the constitution of the trade union itself should be readjusted, not the text of English law.

A third subject was that of "picketing." Theoretically "picketing" is, possibly, harmless; practically it is a menace if not a coercion. By the English law a workman cannot be punished for "peacefully persuading" to strike; the Commission, however, would justly strengthen the present law by recommending that a workman be punished who "acts in such a manner as to cause a reasonable apprehension in the mind of any person that violence will be used to him or to his wife or family, or damage be done to his property."

Fourthly, as to conspiracy, the Act of 1875 declares that no combination to commit any act which, done by one person, would not be an offense punishable by imprisonment, can be made the subject of criminal proceedings. ing to the trend of recent judgments in the courts, however, this does not exempt a union from liability to a civil action a trend so marked as to elicit the not unnatural protest from trade unionists that the law of conspiracy is strained when trade combinations are made illegal though not indictable. It is a distinct event in the English labor world that four out of five of the Commissioners propose that "an agreement or combination by two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute shall not be the ground of a civil action, unless the agreement or combination is indictable as a conspiracy, notwithstanding the terms of the 'Conspiracy and Protection of Property Act of 1875.'" Thus the Commission would grant the trade unions' request—a protection on the civil side corresponding to that which the Act of 1875 gave to them on the criminal side.

Finally, a majority of the Commission also recommends that facilities should be established for incorporating trade The trade unions themselves have not yet signified a willingness to avail themselves of such a privilege they shrink from the advantages belonging to incorporation because they will not accept its liabilities. But most of those outside the unions, whether employers or employed, will, we think, generally agree that the present position of the trade union is as anomalous as is that of the capitalistic trust. Neither should be allowed to evade the law, much less be outside the law, either in England or America. Both should frankly accept a legal status, with all its attendant rights, duties, and responsibilities to the sovereign power—the Government.

Indignant Time

It never seems to have occurred to the drivers of this already too impatient and obstreperous generation that Time might resent their ceaseless assaults, and that his cumulative resentment would, sooner or later, in every particular case, overbalance his forbearance.

All living beings have a clearly defined period of growth, and man is no exception. Probably no other kind of created beings could have survived at all if the orderly development of its young from infancy to maturity had been hurried forward by such various means and in so many ways as we apply to the hothouse forcing of the young of our species, in our mad assaults on the one indispensable requisite for normal growth wherever it can be struck at, reduced, or destroyed.

How vast and multifarious these as-

saults are none of us can even faintly realize, any more than we are aware of the motions of the earth or the weight of the atmosphere; but something of the incredible folly of our craze for the annihilation of time may be understood when we hold steadily before our eyes the fact that every last fiber of our natures, all that we are, in gross and in detail, was accurately shaped to fit a life engineered by hand power and carried forward afoot. That formative life was in nowise secure, and it was frequently strenuous, but all the details of its customary business required considerable time, and admitted of frequent intervals of waiting or repose.

Now, certain characteristics in which we are found wanting by impartial critics, such as self-control, balance, dignity, self-respect (which is not the same thing as self-assertion), courtesy, and integrity, cry aloud for time. "Give us plenty of time," implore these vanishing virtues, "else we perish from the earth." For who can acquire manners by steam or And how shall even minor express? morals be laid on while you wait? here, as well as along the mechanical and physical sides of life, we attack divine Time with all our might, incessantly, never dreaming that we work mischief by interfering with a fundamental condition of human development. And because the eye cannot see what we have done, because a man appears much the same whether he has been fatally flawed in the grain by furnace seasoning or has been permitted slowly and thoroughly to mature in a natural way, we do not take alarm. We draw no inferences, even when our figureheads go to pieces like kiln-dried pulp at the touch of salt water, our corner-stones crumble to mud when an insignificant fireman in the ordinary discharge of his duties happens to turn the hose on a waste-basket blaze, and our venerable wardens and directors go down like a row of bricks if a street urchin happens to joggle the

This is where indignant Time, finding no rest for the sole of his foot anywhere in the world, and realizing unwillingly that we mean to slay and annihilate him utterly, and that we do not want to recognize his beneficence, finally makes a stand and strikes back, not very hard as vet, but still hard enough to bring intelligent beings to their senses. We build our men by a telescoping time-process, manhood jammed down upon children without any allowance for the gradual enlargement of all their powers and capacities to man size; and the result is—what we see. A man so built may be great, may fill a great position where he acquires a world reputation and receives world-wide respect; but on a day the child in him, that we would not give him time to outgrow and shed, steps to the throne and legislates on the affairs of men and nations.

With our mouths we speak the words of condemnation, but our hands refuse to put on the brakes anywhere even for the fraction of a second. But Time never wearies, and again and again will he strike, each instant hewing closer to the line, until we do heed his warning, or-cross the divide beyond which no selfish civilization has power to win back the virile virtues and save itself from swift or slow extinction. The deepest, mordant shame of the recent exposures in high "financial circles" is that these little, childish, irresponsible great men are among our very best citizens, for no one attempts to deny that they were culled by our normal, ordinary process of selection from the very front row of our exhibit available for financial and fiduciary places.

The Message of Christianity

There lies before us the official report of an address recently delivered by Mr. Robert E. Speer before the New England Evangelistic Association, at its twentieth anniversary. It is in part a eulogy of the evangelistic spirit; as such it is admirable. It is partly a criticism of liberal tendencies in the evangelical churches; as such it fails. This is not extraordinary. There are very few persons who are able to interpret correctly religious opinions with which they have no sympathy. For this reason it is ordinarily best not to attempt such interpretation.

Perhaps we misinterpret Mr. Speer: perhaps the persons whom he refers to, who "hold that the evangelical conviction is not tenable any longer," are not in the evangelical churches. Perhaps they are the old opponents of the Christian faith. Yet the following sentence from his address produces a different impression: "The churches whose growth has been slight have been churches regarding which the impression prevails that they have relinquished a little the tenacity of their hold upon the central evangelical convictions." This certainly implies churches which once held those evangelical convictions, and are still identified with the evangelical faith. If so, we question the accuracy of the statement. Plymouth Church, Brooklyn, is one of the churches charged with liberal tend-In fifty years 3,653 persons were added to this church on confession of their faith, and the ratio of increase was nearly as great in the last decade as in the earlier years. Phillips Brooks was openly charged with laxity on doctrinal points; and we doubt whether any Episcopal church has shown a greater spiritual prosperity than did Trinity Church under his ministry, unless it be St. George's Church under the ministry of Dr. Rainsford, who was subjected to even fiercer critcism for his theological opinions.

In Mr. Speer's criticism of the liberal tendencies he appears to us not only to forget palpable facts but to ignore important distinctions. We should like to know what religious paper, avowedly Christian, ever expressed the hope that the Christian Church might be conceived broad enough to admit Agnostics, Confucianists, and Buddhists. Or is this statement simply an attempt to interpret the spirit of a Charles Cuthbert Hall, who recognizes that Agnostics, Confucianists, and Buddhists are sincerely seeking what the Christian Church has to give them? We should like to know what religious teacher, avowedly Christian, thinks "we need to separate Christianity from the historic Christ." Or is this charge a misinterpretation because of the failure to see that one may hold fast to Jesus Christ not only as a supreme example of life but also as the supreme manifestation of the invisible God, and yet refuse to accept any "so-called metaphysical theory with reference to his Person." We should like to know where, in churches or teachers that have ever been called evangelical, Mr. Speer finds a tendency to eliminate the supernatural. Or is this accusation due to the erroneous notion that "supernatural" and "miraculous" are synonymous terms? Mr. Speer rightly affirms the existence of the supernatural in the twentieth century; does he believe in miracles in the twentieth century? We should like to know where he sees in evangelical churches to-day, or in churches that were ever accounted evangelical, a tendency toward "intellectual and moral slovenliness." Or is this charge due to a failure to perceive that conscience for one's self and not for another is not laxity of conscience but a distinctly Pauline liberty of conscience?

Having said this in criticism of Mr. Speer's indiscriminating criticisms, we report as far as we can do, with hearty indorsement, three out of his four affirmative contentions.

I. The end of the Gospel is not creed but character. The Bible is given that the godly man may be thoroughly furnished unto all good works. The Church is given that we may all be brought unto a perfect manhood, unto the measure of the stature of the fullness of Christ. But "character has in it no power to create its own standards." The first gift which Christianity has for the world is an essentially new type of character; its second gift is power—moral and spiritual power -to follow after to the attainment of that character. What the world wants of the Church is, what to-day it is getting from the Church in larger measure than ever before, but not in measure large enough, the preaching of this standard and the proffer of this power. The only use of a creed is that it points the way to Christ, as the only use of a guide-post is that it points the benighted traveler to the city of his search. traveler must not stop at the guide-post, and the inquirer must not stop at the creed. What the man wants is not a doctrine of the true humanity of Christ, but a human Christ whom man can follow: not a doctrine of the divinity of Christ, but a divine Christ to lead man to the Father; not a doctrine of atonement, but a forgiving Christ to lift off from man the burden of the past and give him life for the future.

II. It is true that the man wants the real essential thing within, that he wants the living Christ, the present Christ, a Christ who is as effectual a power today with his disciples as he was with his disciples of old. But it is also true that the life of Christ cannot be broken, that the spiritual experience of to-day cannot be separated from the essential historical facts of the first century, that Christianity is not an air plant, dwelling in the air and feeding on the clouds, an unsubstantial mysticism, but a historical religion; it is at once a present experience and a past history. It may not be easy to determine what in that history is essential and what accidental. Yet Mr. Speer himself recognizes that it is not all equally essential. We agree with him alike in his affirmation that "the Christian faith does not depend upon the virgin birth of Christ" and in his implication that it does depend upon the resurrection of Christ as "the central, cardinal fact of the Christian faith."

III. Mr. Speer has said in his address nothing more true than this sentence: "The one thing that gives Christianity any grip upon the world at all is the supernatural power that is in it." There are two tendencies in the thought world to-day, one away from faith in the supernatural, the other toward a larger and livelier faith in it. The latter is the tendency of the liberal movement in the evangelical churches. It is the faith that all the natural is supernatural, and all the supernatural is most natural; the faith that God is in his world and always in his world: the faith that he is still the God of Abraham, the man of vision, and inspires his vision, and the God of Isaac, the commonplace man, and is his companion in the common walks of life, and the God of Jacob, the sordid selfseeker, and educates him out of his selfishness through the hard school of expe-Never more than to-day did the Church believe in a living God, though it believes in him far too little. And never more than to-day did it need to teach

the truth expressed in such pregnant sentences as these of Mr. Speer:

The Christian religion is not a mere finer form of ethical doctrine. Christianity would be our absolute despair if all Christ did for us was just to come and show us a higher standard than we had known before. We already know more duty than we are doing, and see a higher standard than we have attained. We do not want any teacher to come and mock us with larger light unless he is prepared also to give us more strength to live by and attain to the larger light he offers to us. Christianity is not merely a finer form of ethical prescription. Christianity was meant to be the release of a new power into the world.

IV. If we agreed with Mr. Speer that there is any notable tendency in the Church to-day to come "with a poor, washy, tepid Gospel," and with no appeal to men "to array themselves against falsehood and error and wrong," we should agree with all that he has to say against such a tendency. But we do not believe that it exists. Doubtless there are, as there always have been, in the ministry, reeds shaken with the wind, and men ambitious to be clothed in soft raiment and to sit in kings' houses. But the tendency of our time, as we see it, is toward a more virile, more muscular, more courageous ministry. It is toward a more direct and practical Christianity. It is toward a habit of calling things by their right names. It is toward clearness of thought and courage of conviction. It is toward a refusal to believe traditional faiths merely because they are traditional, and to defend social and business customs merely because they are customary. But if the other tendency does exist, or in so far as it exists, it deserves all the condemnation which Mr. Speer heaps upon it. Cowards are useless everywhere; but not even in the battlefield are they quite as useless as in the pulpit.

We fear that Mr. Speer's unintentionally unjust misinterpretations of his brothers in the ministry will close many minds against his wise counsels. It is not every man who can pay heed to wise advice when it comes from a critic whose criticism he resents as unjust. Yet we hope that readers of this address will be able to pass by without heed its negations and ponder its affirmations.

A Lenten Meditation

The Christ was not only isolated from his fellows in the loneliness of the wilderness, but he was hungry. The primal need of man was upon him and cried out for satisfaction; that fierce, tyrannical need which, in its extreme form, has often driven men to forget their humanity and become like beasts of the jungle. And at the hour in which his body cried aloud for bread his spirit knew that but a word was needed and the solitary place would become a place of abundance! Never before was a soul set to face such a temptation: afar from men, without the support of that opinion and those accepted standards which keep many from falling, suffering physical torment and suddenly made aware of the possession of supernatural powers! In the spiritual history of humanity there is no more impressive scene, nor is there a more majestic and significant victory than that in which it ended.

He had but to stretch out his hand, to speak a word, perhaps even to think a command, and in that moment came the suggestion, "Command that these stones become bread!" "You are a man; you are hungry; you must eat or die; you can supply your need by a word; use your power to keep yourself alive!" Never, surely, was a suggestion more simple and rational than this; never, certainly, was a temptation more momentous. The fate of a soul, of a career, of a service unparalleled, of a pouring out of love which has run like a tide over a sorrowful earth, was at stake. It was a crisis not only in the life of the Christ, the Son of God, but in the life of humanity.

The Christ pierced the illusion of the moment, the apparent insignificance of the deed he was asked to do, and saw with perfect distinctness the tremendous issue involved. The will of the Son was at one with the will of the Father; to do that will was life; hunger and thirst, loneliness and betrayal, suffering and death, were mere incidents in the life of one who knew that he was immortal. In that terrible hour, as in so many hours when great souls are tried, the temptation

not only met unsurmountable resistance but evoked a ringing statement of one of those truths which shine like stars above the confusion of the world: "Man shall not live by bread alone, but by every word which proceedeth out of the mouth of God." The Christ refused to use his power for himself; it was dedicated absolutely to the men whom he came to seek and to save.

In a time when greed has become so gluttonous that it is revolting and so aggressive that it is merciless, how like a vision of heaven shines this incident in the story of one who came not to be ministered to but to minister! There has come a flood-tide of power into the modern world, not from springs in the human spirit, but from the fountains whose sources God has sunk deep in the earth. Men have not created the almost incalculable wealth of these recent years; they have used the treasures of field and mine, the forces of air and earth, to do their bidding and to work for them. The knowledge which science has put into their hands has enabled them to open up the world and to develop its resources on a scale undreamed of before. our fathers these forces would have seemed supernatural; in any adequate conception of the universe they are supernatural in the sense that they testify to the presence and power of God here and now, in a world which unfolds like a scroll as men travel on in the mysterious pilgrimage which we call history.

How are men using this tremendous power from God? Are they feeding the world, or are they storing up bread for themselves far beyond the utmost limit of the most gigantic gluttony? Are they using these vast forces at their command like human beings with reason, heart, and soul, or like the beasts which snatch all that lies within their reach, and what they cannot eat pile in a refuse heap and guard with ugly snarls? These are searching questions; let every man answer them for himself. The age puts them to every man, and no man can evade them. There is a gathering of goods which is honorable and noble, because made fairly and used spiritually; but there is also a gathering of goods so greedy that men are turning from it as from the repulsive gluttony of animals. How shall a man use the power with which God has clothed him; shall he feed himself or shall he nourish his fellow? Behold the Christ hungry the wilderness!

The Open Shop

The article on Nuremberg, the City of the Closed Shop, printed on another page, is entertaining, dramatic, and instructive; but to the lover of liberty it is not an argument for the revival of the Nuremberg method. Indeed, the author of the article frankly concedes this: "No informed mind will consider it either possible or desirable to return to the mediæval guild or the social system involved in it."

Underlying the issue between the closed and the open shop is a fundamental question: Is liberty desirable for its own sake, or only for the material benefits which it brings? "The Nuremberg artisan produced good work," we are told. Possibly in the closed shop in our own time better work might be produced than in the open shop. We doubt it, but, were it so, the fact would not be conclusive. The product produced by the laborer is not the only test of character, nor of the system under which he labors. Before emancipation it was said that the negro would not work except under slavery; and that slavery was therefore justifiable. It is now said that the Panama Canal cannot be dug except by contract coolie labor; and that therefore contract coolie labor must be imported. The answer in both cases is the same: Freedom is worth more than either cotton or the Panama Canal. The closed shop, as Mr. Bliss describes it, was wholly inconsistent with industrial liberty. It is better to be free than to be rich; it is better to be free than to be a skilled artisan. Manhood is more than things, and liberty is essential to the ultimate development of the highest man-

This is our argument for the open shop condensed into a sentence.

CHINA IN TRANSITION

A HOUSE-BOAT TRIP IN CHINA

BY GEORGE KENNAN

Special Correspondent of The Outlook in the Far East

This is the first of two articles in which Mr. Kennan will relate his observations in a journey by canal into the interior of China.—THE EDITORS.

TF any one should ask the question, "How can I see something of China and make the acquaintance of the Chinese people with most pleasure and least hardship?" I should reply without hesitation, "Hire a good house-boat: fit it up with bedding and provisions; engage a cook, a 'boy,' a native crew, and a competent interpreter; and then set out on a voyage of exploration through the great labyrinth of rivers, creeks, lakes, and canals, which extends like an immense watery network over the whole eastern part of the Middle Kingdom." Land travel in the interior of China—by horse, donkey, camel, mule-litter, Peking cart, or sedan chair—is attended with much fatigue, if not actual hardship and privation; but water travel in a well-appointed house-boat is as easy and comfortable as it is entertaining and instructive. If you have plenty of leisure and wish to study carefully or enjoy thoroughly the region through which you pass, you may be pulled, rowed, or poled along at the rate of two miles an hour. and may stop at frequent intervals for the purpose of making side excursions overland; but if, on the contrary, your time be limited and you wish to travel rapidly, you may "catch on" to one of the daily house-boat trains which run back and forth through the canals, and be towed to your destination at the rate of seven or eight miles an hour by a powerful steam tug. If the weather be warm and you feel indisposed to exert yourself, you may sit all day in an easy chair on the roof of your moving boat and watch the unfamiliar Chinese panorama as it unrolls ahead and vanishes astern; or, if the air be cool and bracing, you may tie up to the bank and

go ashore, to walk through a picturesque village, visit a queer temple, photograph a pagoda, or examine the ruins of an old fort. Whatever you do and wherever you go, you carry your home with you, and have at your command all the comforts and many of the luxuries of life.

You need not fear that if you confine yourself to waterways your range will be The canals of China are many thousands of miles in aggregate length, and, in connection with the rivers that they intersect, they give access to almost all parts of the Empire. In the seacoast provinces of Kiangsu and Chekiang alone you may travel by house-boat for two or three months without going through any particular river or canal twice; and if you are ambitious to go further afield, you may make a straightaway journey of eight hundred miles from Shanghai to Tientsin by way of Hangchow and the Grand Canal, or a still longer trip of fifteen hundred miles from Shanghai to Hongkong by way of the Yangtse, Hankow, the Siang River, the Kui River, Kuilin, Wenchow, and Canton. In short, you may see from the deck of a house-boat the greater part of eastern China.

If the hundreds of American tourists who pass through Shanghai every fall on their way around the world knew how much pleasure they could get out of a house-boat trip of a week or a month through the picturesque canals and beautiful lakes of Soochow, Hangchow, and the Shanghai hinterland, they would not rush on, as they generally do, to Kobe or Hongkong; nor, if they had a week or a month to spend in China, would they waste it in driving through the European streets and loafing in the

Digitized by Google

European hotels of foreign settlements and concessions. Most tourists who visit Shanghai, however, have never heard of house-boat trips on Chinese canals, and after spending a few days at the Astor House, strolling along the Bund, driving out on the Bubbling Well Road, and visiting the native city, they go on to Yokohama or Hongkong, perfectly ignorant of the fact that they have missed an opportunity, not only to see something of the interior of China, but to enjoy an exceptionally pleasant and interesting experience.

For the suggestion that put us on the track of Chinese house-boats we were indebted to Mr. H. B. Miller, our thoughtful and experienced Consul-General in Yokohama. Just before we sailed from that port he said to me, "If you have time in Shanghai, don't fail to take a house-boat trip up country. Nothing that you can do will afford you more pleasure or give you a better idea of Chinese life—especially the life of the common people in their villages and on their farms." Soon after our arrival in Shanghai we acted on this suggestion, and found, to our surprise, that it was almost as easy to arrange a house-boat trip "up country" as to get first-class tickets in the passenger department of an established steamship line. A young English business man who owned a boat that he was not using agreed to let us have it for ten taels a day, including the wages of the Chinese captain and crew; the proprietor of our hotel undertook to furnish cook, boy, bedding, dishes, ice, boiled water, and food; and on the after-...noon of Monday, October 23, the houseboat Annie, fully manned, equipped, and provisioned, lay at the Garden Pier, opposite the Astor House, waiting for her passengers.

A Shanghai house-boat, of the European type, is from forty to sixty feet in length over all; has a beam of ten or twelve feet amidships; and carries a crew of six or eight men. Its equipment for sailing consists of pivoted leeboards on the sides, a single lugsail, with ten or twelve bamboo battens and an equal number of sheets, and a long, unstayed pole mast which may be quickly and easily lowered, by means of shears and

tackle, when it becomes necessary to go under a bridge. In the house part of the boat, which covers two-thirds of the deck, there is a fairly spacious cabin, with a long cushioned seat or couch on each side, and at night this cabin may be divided into separate sleeping sections by means of heavy curtains hung lengthwise and crosswise from the ceiling. At one end of the general living-room there is a door opening into a small kitchen and pantry, and at the other end a similar door gives access to a toilet and wash room. Under the broad seats in the main apartment there are lockers for curtains and bedding, and on the deck outside there is an ice-chest or refrigerator for fresh meats and fish. On the cabin roof, which is carpeted with cocoamatting, and sheltered, when necessary, by an awning, there is plenty of room for easy chairs; and in the capacious hull, under the main deck forward, there are sleeping accommodations for the crew. Our boat carried no less than fourteen persons, and had room in the cabin for two more.

The house-boat trip that we had planned was a triangular excursion from Shanghai to Soochow, from Soochow to Hangchow, and thence back to our starting-point by a different and somewhat longer route. This would enable us to see about one hundred and thirty miles of the famous Grand Canal, and would give us, in the aggregate, nearly four hundred miles of river and canal navigation. In order to economize time as much as possible, we decided to make the first stage of our trip by the regular house-boat train, which leaves Shanghai for Soochow every afternoon at five o'clock. An hour before that time we were all on board, and at fourfifteen our captain, a mild-mannered Chinaman in a faded blue cotton jumper, misfit foreign trousers, a visored European cap, and white-stockinged feet thrust into down-at-the-heel slippers, came into the cabin with an apologetic air and inquired, "How say, Master, can go?"

"Yes," I said. "Can go, Where catch train?"

"Catchee tow bimeby Soochow Creek," he replied, and, touching his weatherbeaten old cap, he went forward to call the crew and cast off the mooring-lines.

When I climbed up on the cabin roof, five minutes later, we had passed under the Garden Bridge and were poling up a muddy canal, fringed with double and treble rows of house-boats, sampans, and junks, and shut in by parallel lines of three-story European buildings standing fifty feet back from the water on thronged and dusty streets. The further we went from the entrance to this canal the greater became the number of boats moored along its sides, or moving back and forth in the narrowing strip of open water between; and before we reached the starting-place of the Soochow boat-train we were forcing and clawing our way through a dense but yielding pack of house-boats, cargo-boats, timber rafts, skiffs, sampans, and junks, which were wedged and jammed together in an almost inextricable tangle, and which seemed to be guided and propelled by a horde of ragged, bare-headed, barefooted, yelling, cursing, gesticulating Chinese lunatics. The only quiet and self-possessed individuals that I could discover in all that wild bedlam of noise. confusion, and excitement were a sober, contemplative monkey and a small, moon-faced Chinese baby. The baby was strapped on the back of a sunburned peasant woman, who, with the feeble assistance of a small boy, was trying to force a vegetable-laden sampan through the dense pack of larger boats. Although the infant's head waggled jerkily back and forth with the energetic movements of its mother's body as she swayed to and fro on the long, curved sculling-oar, it showed no sign of fright or discomfort, and when it passed out of the range of my observation it seemed to be making up its mind to go to sleep. monkey, which was sitting on the high stern of a varnished junk, was quite as cool and unconcerned as the baby, but it took a more intelligent interest in its environment, and watched with a sort of grave, speculative curiosity the frantic efforts of a hundred men to get their junks past one another, around one another, or across one another's bows. Every boat except ours seemed to have a crew made up exclusively of captains;

every captain stopped shrieking orders only when it became necessary to swear; and the crash and grind of colliding boats, the waving and clawing of boathooks, and the intermingled voices of a hundred men, raised in shouts of command, warning, derision, or defiance, made up, altogether, a Chinese pandemonium which I had never seen equaled, and which I cannot adequately describe. For a distance of at least half a mile the narrow canal was an almost solid mass of moving sampans and junks; and how, in that tangle of interlocked boats, the train for Soochow was made up I do not know. Made up, however, it was, and soon after five o'clock we took a line from another house-boat just ahead of ours, and, in tow of a small but powerful tug, our little caravan scraped and bumped its way out of the pack into a stretch of comparatively open water. Half an hour later we left the outskirts of the city behind us, and when the sun set, in a swirl of pinkish vapor, we were moving swiftly westward across a great flat plain, where the horizon line was a distant fringe of mulberry trees and willows, and where winter barley, in long green rows, had already taken the place of the harvested rice. As soon as it began to grow dark and chilly on deck we went down into the cozy, welllighted cabin, where the table was already set for dinner, and where our "boy" soon served up a meal which dispelled our last doubt as to the possibility of living comfortably on a Chinese houseboat.

We were due at Soochow early Tuesday morning, and soon after it began to grow light I turned out in my pajamas and went up on the cabin roof to "look see." We were still running through an extensive cultivated plain, fringed and dotted with low trees, and diversified here and there by the compact little villages or solitary tile-roofed houses of the native farmers. We were just passing under one of the high, curved, "camel's back" stone bridges which are so characteristic of Chinese canals, and in the distance ahead I thought I could see the smoky haze which rises in the early morning from a hundred and fifty thousand domestic fires in the great city of Soochow.

As the morning air was sharply cold, I was soon driven to the shelter of the cabin; but three-quarters of an hour later, when I went on deck again, we were just casting off our tow-line at the corner of a massive crenellated wall, thirty or forty feet in height, which stretched away about two miles in one direction and four or five miles in the other. Its front was broken by great square projecting buttresses, seventy-five or a hundred yards apart, and between them, against massive bricks which were old when the Goths and Vandals captured Rome, some modern vandal had hung up scores of framed cloth advertisements bearing, in big black English letters, "Spiketail Cigarettes." Those detestable placards vulgarized and modernized the most interesting and venerable monument of Chinese antiquity that I had yet seen, and completely spoiled the pleasure that I should have taken in imagining the historic tragedies and pageants which that old gray wall had witnessed in the twenty-four centuries of With "Spiketail Cigaits existence. rettes" staring one in the face, one could imagine nothing older than the American Tobacco Trust, and think of nothing more inspiring than "How to write ads." I might possibly excuse the Chinese for attacking foreign settlements and murdering foreign missionaries, because for such action they had—or imagined they had—some provocation; but I can never forgive the officials of Soochow for selling to a foreign advertising agent the right to plaster "Spiketail Cigarettes" all over walls whose foundations were laid before the days of Pericles, Sophocles, and Herodotus. Men capable of that would not hesitate to sell their grandfather's skeleton for use as a middle layer in an advertising sandwich! However, I am now prepared for almost any display of American business enterprise, and shall feel only a mild thrill of disgust if, when I visit Athens, I find "You've Got to Eat a Biscuit" printed in big black letters on a long strip of white cloth and hung across the columns of the Parthenon.

Before we had fairly lost headway, after casting off our tow-line, a boat came off to us from the Imperial custom-house, bringing the Rev. Benjamin L. Ancell, head of the Episcopal mission at Socchow, who had been notified by telegraph of our departure from Shanghai, and who had been good enough to come entirely across the city at that early hour to meet us.

"It must have been a great bother to you," I said, "to come all the way down here at this time in the morning."

"Oh, no!" he replied. "It was easy enough to-day; but some months ago, when the Shanghai boat-train arrived earlier, I undertook to meet some friends at this custom-house, and had a mat exasperating experience. The principal streets here are divided into short stretches, or sections, by what they call 'thieves' gates '-gates intended to prevent thieves and robbers from escaping from one part of the city to another. These gates are closed, of course, at night, and on the morning to which I refer I passed fourteen such barriers, and at thirteen of them the gate-keepers were asleep and I had to wake them."

No single item of information could have made me realize more vividly the immense difference that exists between the East and the West. Imagine the city of St. Louis with a thirty-foot stone wall around it, and a hundred and fifty big wooden gates dividing its streets into closed sections at night, and making it necessary to rouse a gate-keeper every quarter of a mile! And yet Soochow is as large a city as St. Louis, and, relatively, is almost as wealthy, and from a commercial point of view almost as important.

Acting upon the suggestion of Mr. Ancell, we sculled and poled half around the city, outside the wall, to an extramural suburb near the Chang-Men Gate; and there, in a house-surrounded basin, where two or three canals converged, we pushed the bow of our boat ashore in an almost solid pack of sampans and junks of every imaginable size, shape, and description. Two-thirds or more of these boats were fitted up for housekeeping and were permanently inhabited by Chinese families, so that, in addition to the rabbit-warren of dwellings all around the basin on land, there was a small village of floating houses on

the water, and the incessant chatter of the swarming population made as much noise as an excited political convention not yet called to order. As a place to lie for a few hours it was extremely interesting, because it afforded us an excellent opportunity to study the every-day life of the common people; but it would have been an impossible place to rest, meditate, sleep, or, in fact, do anything but watch and wonder. In the course of a few hours one might see there every social function of the Orient, from a wedding to a funeral, and every detail of domestic life, from the washing of rice, the nursing of a baby, or the shaving of a head, to the spinning of yarn, the setting off of firecrackers, and the feeding of a canary bird. I venture to specify only a few of the things that we actually did see, but there were scores of others which I have not time or space even to mention. Between nine and ten o'clock Mr. Ancell hired for us a small, lighthousekeeping sampan—a sort of Chinese gondola with a long, curved sculling-oar, a matting house amidships, and a family crew-and we set out for an exploration of the city.

Soochow was founded by the Chinese monarch Hoh-Lu, about 500 B.C., and it therefore has a history of nearly two and a half millenniums. It has been taken and sacked repeatedly in civil wars, but, in modern times at least, its salient features have not changed, and a stone map which is still preserved in one of its temples, and which is now almost a thousand years old, shows its principal streets and temple sites in their present Standing as it does on the locations. Grand Canal, and in the midst of a fertile. well-watered plain which produces more than twelve thousand bushels of rice to the square mile, Soochow has always been a wealthy place, and a competent authority declares that more good clothes have been worn there than in any other city on the globe.1 To one who thinks of Paris, London, Berlin, Vienna, and New York, this seems like an incredible statement: but it must not be forgotten that Soochow is almost as old as Rome, and that it was a center of literary culture, commerce, and wealth when Cæsar invaded Gaul. Two thousand years ago it was the capital of "one of the strongest and most famous of the principalities into which China was then divided," and, in the main, it has been prosperous and wealthy ever since. At the present time it covers an area of eight or ten square miles and has thirty miles of canals inside of its encircling wall. It contains seven large pagodas, two of them more than a thousand years old; nearly two hundred bridges, mostly of stone; two or three hundred temples, with seven thousand priests; twenty-five hundred official residences, with forty thousand servants, attendants, and retainers; and a total population of about seven hundred thousand souls. Commercially, it is one of the most important of the inland treaty ports. Sixty or seventy tugs, built for canal navigation, maintain daily communication with Shanghai, Chinkiang, Hangchow, Kuangfu, Fusieh, and scores of other large market towns, and thousands of junks and cargo-boats are engaged in the transportation and distribution of rice, silk, millet, fruit, vegetables, building materials, and European goods.

After rowing through a number of narrow, picturesque canals, where women were washing rice at the boat-landings or lowering buckets for water from their second-story windows, we proceeded to the suburban residence of the wealthy mandarin and railway magnate Sheng-Kung-Pao, which is regarded as one of the show places of Soochow, but which, like the city, is strange and interesting rather than beautiful. It occupies a very extensive walled compound, a mile or two from the Chang-Men Gate, and consists of a great number of detached, highly ornamented, one-story wooden buildings, set here and there in twenty or thirty intercommunicating courtyards, amid lotus ponds, miniature canals, gardens, bridges, pavilions, mazes of yellow artificial rock-work, stone walls with circular gateways and carved dragon copings, and a labyrinth of winding paths paved in mosaic patterns with colored pebbles, shells, and small fragments of broken porcelain. As a typical specimen of a wealthy mandarin's home it was

¹ The Rev. H. C. Du Bose, to whom I am indebted for many of the facts set forth in this article.

curious and interesting, and from the Chinese point of view it was doubtless beautiful; but for the Western taste it was too crowded, elaborate, and artificial. The trees were mostly twisted or dwarfed; the rock-work looked like molasses candy molded into fantastic hummocks and pinnacles; the walls which separated one section of the grounds from another prevented the eye from getting any satisfying sweep of distance; and there was not a suggestion of untrammeled, undistorted nature in any one of the twenty or thirty small, contrived, artificial landscapes. The interiors of the buildings, with their elaborate wood carving and intricate fretwork, were less objectionable to Western taste than the courtyards and gardens; but even there the ornaments and decorations—big mirrors with pinetrees painted across them, and slabs of white marble in which dark veins and cloudings made accidental freak pictures. of mountains and gorges—were not such as would be likely to please the Western eye. Connected with the residence as a whole, but in separate buildings, were a small theater and a library; but the former contained no scenery, and in the latter there were to be found no foreign books.

From Sheng-Kung-Pao's suburban residence we rowed back to the broad encircling moat outside the wall, and, passing through the wall, entered the network of canals which divides the land of the city into twenty-five or thirty nearly rectangular islands. Soochow is regarded by the Chinese themselves as the most delightful place of residence, if not the most beautiful city, in the

Empire; and they have expressed their appreciation of it in the widely known proverb, "Heaven above-Soochow below." To a foreigner, however, who has standards of comparison unknown to the dwellers on the great Chinese plain, the city is strange and interesting, but not beautiful. If it had no temples, pagodas, and canals, it might fairly be described as a great flat human beehive a vast agglomeration of architecturally insignificant houses crowded together inside an ancient and massive wall. Its temples and pagodas, however, relieve to some extent the impression of monotony made by the tens of thousands of nearly uniform buildings, while its canals, with their hundreds of graceful bridges, draped often with clinging vines, invest the city with a charm which is not unlike that of Venice. The houses that stand along these canals may not be stately palaces, but they rise directly out of the still, bluish-gray water; flowering vines, yellow gourds, and leafy branches of trees hang here and there over the walls of their courtyard gardens; varnished sampans and junks land passengers at their flights of projecting steps; and in the foreground or middle distance there is always a stone bridge, with a semicircular arch and a high curved footpath, to give picturesqueness to the water view.

I should have been willing to spend the whole day in a noiseless and restful sampan voyage through these tranquil, house-walled canals; but, as it was almost noon, we made our way to the Episcopal mission, where we were to take tiffin and then set out for an exploration of the narrow city streets in palanquins.

A RUSSIAN WOMAN'S VIEW

The following extracts are from a private letter written last December by the widow of a Russian naval officer. In what seems to us a touching as well as an intimate way, they show how the social unrest and political agitation in St. Petersburg have affected the family life. The effect of college and school "strikes" on the young people is strikingly brought out. The whole simply enforces one's conviction that sensible, sane, and moderate ideas of social order and political government must prevail among intelligent people in Russia, if that country is to emerge from the anarchy threatening it on the one side and the tyranny on the other.—The Editors.

HE children give me great satisfaction with their studies, as they learn with great application. I cannot tell you that there are many mothers in Russia who can say the same just now. You know how those foolish school strikes affect all the youth of the present day. Several times they have stopped their classes; sometimes it is the professors that join the strike with a political object, sometimes it is the boys and girls that refuse to go on studying before they get some new right for their school. Indeed, I know a high school that in all this year, from January to January, has been opened only one month; and now one of my friends, a professor there, has told me that he does not think it will be open before next September.

Now, I have for a while living with me a nephew of mine, a charming, bright, clever boy of seventeen whom I love dearly. He has in him, I am sure, the making of a good, useful man, but the lawless time that we are living in now has a very bad influence on him. He does not work any more, he does not belong to any political party, but one day he believes himself a Revolutionary, and the next he finds that the most important thing in the State is to get for boys longer holidays for Christmas. He is hanging on most of the time at our house without any occupation for his mind, not doing anything bad yet, but ready and ripe, I am sure, for any bad influence that shall reach him. He does not study, he does not regard any longer any rules or fixed hours; he speaks with contempt of all his professors, but yet could not tell in what way they have earned his contempt. He wants to do as his elders, to put everything upside down and get lost among the new political parties that grow all around as mushrooms grow in damp ground after the rain.

Children as well as men have lost faith in everything. They don't believe in the Government, they don't believe in their professors; many, indeed, have brought their doubt even in their own homes and do not believe any more in the judgment of their fathers and mothers. Everything has shown itself wrong in this dreadful war; we cannot, I am sorry to say, as before most Russian parents used to do, count on the influence of the Government to make good, upright men of our children. In this time more than ever fathers and mothers ought to take to heart their duty to their children. How they ought to be careful of their acts and of their tongues! Never to announce a false judgment or a senseless opinion before youth so ready to judge, so quick to observe, so easily led astray. How they ought to be careful never to shatter their children's faith in them. and to keep their good influence as a priceless arm in their hands to make of their boys and girls a good, useful, strong generation!

It is, I think, if we look into the future, the saddest incident of the Revolution—this child's strike of whom so many senseless people make a good joke. These boys are the men of to-morrow, and in idling away the best years given to them, how do they prepare themselves to meet their new duties of free Russian men when the country shall be at last pacified, but more than ever in need of able men to build it up again?

Perhaps we mothers of fatherless children ought to be the most afraid of

Digitized by Google___

the responsibility; but somehow I think that those children of our heroes of the war have such a past to look at, such a heredity of courage, loyalty, feeling of duty, that I don't seem to be afraid for them—they must be worthy of their fathers, God help us! I am more anxious for the children of those inactive, opinionless men saying one day one thing before their boys and to-morrow something else, and losing in this way all the influence necessary to exercise their sacred duty of educators. . . .

Well, everything is quieted down in Moscow, with only the remembrance that thousands of people have, of seeing many coffins going secretly to the churchyard, and of a sea of blood that went to increase the red flood that has already nearly drowned the country. But death does not seem to signify much here now; one has grown accustomed to it. yesterday in a Revolutionary paper a Christmas tree with heads of death on it, and all around, looking on, the faces of the principal statesmen. I found it the very expression of the feeling that one has at heart now in these pitiful holidays. The only mistake of the drawing was that they put around the tree only statesmen; they ought to have put the largest crowd possible, meaning all the But yet, in this poor, wounded, humiliated country, so many do not care, so many have lighted their tree as always, and danced their "masurka" round it as if there were no war, no mourning, no revolution, no death all around!

Some optimists think that everything is nicely calmed down, and that Russia is really going to have a Parliament and a Constitution. God grant it! But those who believe in it are very few. Most think that all is ended as it always used to end before: the Government has been the strongest; and now, after killing so many of its own people, it feels again the strength in its hands, and won't drop a particle of its "unlimited" power.

This means reaction, endless arrests and disposition of men, loss of so many young innocent lives, dark, cruel captivity in the fortress or Siberia, as before; no liberty of speech, no liberty of press, no liberty at all; but the old yoke heavier than ever. It means more blood and tears for our children, as no nation can stay always under the iron grip.

Of course lack of self-confidence is at the bottom of all the misery in Russia. Why, a foreigner can live here in Russia ten years, twenty years, all his life, and never become a Russian. If he was a German twenty years ago, he is a German to-day, and will be a German to the end. His children will be German, speak before everything their father's language, and keep all the customs of Germany. And it is the same for all the nations. A Polander is a Polander always, a Swede a Swede, a Finn a Finn. (To this rule of course there are exceptions, like myself, but those are particular cases.) There is no assimilation as in your country, for example. Do you remember how many Russians used to say to you that America had too much self-confidence? Well, perhaps (I shall not discuss this point) it is not a very attractive quality for the foreigners to see in a nation; but, I give you my word for it, it is the most useful and essential quality for the strengthening of a nation. And here in Russia I am sure of it that lack of confidence has been the worm eating its very heart and shattering the country to the marrow.

If a man came to your country to live his life, to earn his bread, to make his fortune, he would hear very often around him that America is the best country, that every American thing is the best thing, and American people the best people; so that, without knowing it, perhaps, he would find himself one day wishing to be an American, or at least his children and grandchildren shall be quite American. I shall never forget how, when I was living in Philadelphia, I boarded in a French family; the father was a Belge, the mother a Frenchwoman, and yet you would never believe, when you came in, that it was a foreign home; and a little, pretty girl of six got quite cross at me and showered bitter tears because, not knowing yet the country's ways, I called her a little French girl. "I am an American, indeed I am," she used to say.

To have carried on our Russian shoul-

ders for more than two years the weight of the war and the Revolution, to have given so much, to have lost so much, and to come to the conclusion that all this was perhaps in vain and that the country did not gain anything, is enough to madden anybody!

A LEAF IN THE STORM.

MISSION WORK IN THE ROCKY MOUNTAINS

BY THE RIGHT REV. JAMES BOWEN FUNSTEN

Missionary Bishop of Idaho

BELIEVE that every thoughtful American takes an interest in not only having a greater country, but a better people. Efforts to reach the submerged tenth in our great cities are attracting more and more attention, and it is certainly true that the concentration of masses of people in a limited territory presents a danger point in the National life and makes a perplexing problem for Christianity. This is, however, not the only problem that we have to consider in a domestic way, in our development as a people. In the great cities Christianity has to confront conditions brought about by over-population, whereas, when we come to deal with the propagation of Christian truth in our new Western States, we have the perplexity arising from scattered population, heterogeneous peoples, whose theological preferences are as variegated as Joseph's coat, and whose individualism has been cultivated under the conditions of isolated ranch or degenerate mining town. The problem of infusing into this life the refinement, the spiritual outlook, the unworldliness, that belong to Christianity, is a very difficult one, but is most important when one realizes the growing influence of these States in the National life.

The great question that we have to consider as a Christian Nation is, How can we advance the kingdom of God in the homes and hearts of the thousands of people who are coming from all parts of the country to cast in their lot here in the Northwest? These people, in many cases, have left behind them Christian homes and institutions, but coming here, though they find material things full of fascination and promise, are ofttimes

very much impoverished in their spiritual outlook.

It so happens that the country in which for nearly seven years I have been doing mission work lies in what is called the Rocky Mountain region. When I go out into western Wyoming, to the eastern end of my district, I am several hundred miles on the Atlantic side of the continental divide, whereas the western line of the district is coincident with the eastern boundary of Ore-The whole country is what might be termed, in a certain sense, frontier. The scenery is wild and grand; everywhere there are prospects of material wealth-mines of gold, silver, and copper in the mountains; fruit-raising in southwestern Idaho; ranching along the rivers, where irrigation is possible; stockraising on the wide, undeveloped plains. Hundreds of people are moving in; undeveloped lands are being irrigated and settled: and before many years roll around, the stars of such States as Idaho and Wyoming will shine with a new luster in our National banner. We want to see to it that Christianity does its part in the development of these border States. It is a perplexing, difficult problem, that of reaching these scattered people who live among the mountains of Idaho and Wyoming, but it is well worth while for us to do all we can to lead them to Christ. It is interesting to note that, leaving out mining towns, eighty per cent, of the population of the Pacific Northwest, which includes the States of Oregon, Washington, and Idaho, are American born. The rest are mainly of English or Scandinavian origin. With a wonderfully healthful climate and a great variety of products, with an energetic and American population of intelligence and sturdy physical qualities, it would seem that Idaho and the Rocky Mountain people may be counted on as factors of considerable importance in the future of our country.

It has been my mission to visit many mining camps and to talk to the people of these communities in their homes, and also at services held for their benefit. The heartiness of their greetings, and their ready appreciation of efforts made in their behalf, have compensated me for the long stage journeys through the mountains that I have had to take in order to reach them.

The mining camp in active operation, however, knows no Sunday. I remember on one occasion visiting a mining community, and it so happened that I was detained in a certain town the whole of Sunday, and did not reach another place where I was to have service until Monday. A leading man of the community helped me to give rapid notice, and at two o'clock in the afternoon I preached to a hall filled with men and women, who gave the most eager atten-While I was at the store with the man who had arranged the services I said to him, "That was a splendid crowd we had out to-day." He replied, "Yes, Bishop, we always do have a big crowd when we have a service on Sunday." "But," I said, "this is Monday." "Well," he said, "do you know we thought it was Sunday I" Perhaps but for this mistake I might not have had such a good congregation, as there is a good deal of inherited respect for the Sabbath Day. My predecessor was on one occasion making his annual visit to a mining town far away in the Owyhee Mountains. As he was going up the cañon leading to the mining camp, he saw everywhere advertisements of a show. "Ah," he said, "now I'll have a fine turnout tomorrow. There will be people here from Heap Ranch, Reynolds Creek, Sinker Creek, and other places." The show, however, stayed over Sunday, and when the Bishop went to the hall he found one solitary man, who said, "I am very glad to see you, Bishop; here's a dollar for the collection; but you know you come every year and this show comes only once in three or four years, so we'll have to go to the show." Things are, however, improving even in this locality, because in less than twenty years after this occurred, in the same mining town, I confirmed on a Sunday ten people, baptized ten or twelve children, consecrated a church, and preached to a church full of people morning, afternoon, and night.

In a coal-mining camp where they have a very heterogeneous population, and where thirty-five languages are spoken, I remember the first Easter I had services there I preached to a congregation of twelve people, and the offering was less than two dollars. Now we have a clergyman doing a good work at that point, and on any day of the week when service may be held one could easily count on a good congregation. I mention these facts to show that though the problem of Western missions is a difficult one, earnest, aggressive work is appreciated, and that the spirit of Christ, which is the spirit of sacrifice, love, and progress, must sooner or later be fully recognized even among these miners, cowboys, sheep-herders, ranchers, and, I may add, Indian people.

One thing I have observed in my dealings with the people of this country is that they have an exalted ideal of what a Christian ought to be, and, with all their carelessness personally, they have a very high standard—intellectual, moral, and social—for the man who talks to them on the subject of religion, or who desires to influence them in matters pertaining to their spiritual life. While it is an easy thing for people to have high ideals for other people to fulfill, at the same time, even in this, there is a promise of better conditions in a social and religious way for the future of this country. It also gives a good guarantee that the leaders will feel the responsibility that comes from an intelligent public opinion.

The country is so large, the boundless rolling sage-brush plains so suggestive of breadth, the great snow-capped mountains, rising 14,000 or 15,000 feet, so defiant of narrowness, that we can but believe that the Christian worker will

gather somewhat of the true meaning of the length and depth and height of the love of Christ in his dealings with humanity. He will be but a poor worker who tries to import into a country like this the narrowness, the intolerance, the prejudice that grew and developed under artificial conditions of Christianity, social and political life. They do not historically belong to this part of the world, and, in my opinion, based on observation, they will never be accepted by a people so heterogeneous in their origin that they find in this very thing a protection. The simple truths of Christianity, earnestly presented—the appeal to the moral law, the recognition of the Fatherhood of God, the Divinity Christ, the Brotherhood of Mankindare elemental truths which, along with others of like character, form the backbone of Christianity, and will furnish the foundations of noble living when presented by earnest and devoted workers for the Master. I have found it effective in meeting the tremendous responsibilities of a district like that intrusted to me, to recognize man's triple nature. We have our hospitals, where on the broadest scale of Christian charity we are trying to help suffering humanity without any regard to creed or race. only trying to relieve in the best manner possible the ills to which flesh is heir. Of course this is only remedial work for the body. I would like to have the means in many places to establish reading rooms and parlors; for in the greater number of towns and communities in my district there is practically no place for a homeless man to go to but the saloon or gambling-den; and of course the result but too frequently is the destruction of the body and all that that involves. We are trying to reach the training of the mind through our schools. Here, under Christian instruction, we have girls who come from mining camps, isolated ranches, broken homes, and other places; some coming as far as eight hundred miles from an Indian reservation—representing all the different denominations, preparing to be true, earnest, Christian women, to serve God in that station of life to which they may be called. Two of our girls who came from a mining camp are now teaching in Porto Rico, in the Government schools; two are connected with the Philippines, as wives of army officers; three or four hundred are scattered through the Pacific North-This work is not competitive in reference to the public school, but is cooperative, reaching conditions that could not be met by that institution. In addition, under the laws of Idaho, no religious service is allowed in the public schools, whereas with us it is made a factor for the training of those committed to us, though by no means in a narrow spirit. Our third department of the work, of course, is what I have already referred to, the preaching of the Gospel and the establishment of missions in the new towns and communities that go to make up this country. Quiet and unostentatious must such evangelical work be in the midst of so much materialism. among people who in some cases are going back to the wild, and whose interest is so entirely centered on mining, irrigation, and development schemes. Still, it is our duty to do what we can to create a public opinion in favor of Christian character and habits, and when one is the means of effecting this in behalf of the men and women who are coming here to lay the foundations of a great inland empire where the desert is being driven out, and American towns and homes being made, he is doing not only Christian but patriotic work. "Idaho" is said to be the Indian name for "light upon the mountains." May it symbolize the coming of the Light of Life into the hearts of these people who are casting in their lots in this frontier Rocky Mountain region !

THE PARALYSIS OF CRITICISM

BY HUGH BLACK

Author of "Friendship," "The Practice of Self-Culture," etc.

TE are often said to be living in a difficult age, though every age appears difficult to the men who actually live in it, since every age has to adjust itself to new situations. The difficulty to-day is usually traced, especially in religion, to the new critical attitude of men's minds. Criticism puts everything into the melting-pot and will let nothing escape from its tests. Law cannot get off because of its authority, nor religion because of its sacredness. This is good and necessary; for we cannot set bounds to the mind of man, which has definitely slipped from old fetters. We even welcome the process when we see that a critical stage is needed before a stage of reconstruction. But the very real danger arises of mistaking the scope and function of criticism, and it is worth while considering its practical limitations in every region of life. So much has been accomplished by critical processes that we are tempted to make these an end in themselves. After criticism comes the opportunity for getting at new values and truer appreciations. After analysis comes the need for a larger synthesis.

Further, we must not forget the danger of letting criticism paralyze life. For the practical business of the world men must risk something and must not allow their general ignorance to prevent them from their particular duty. The art of agriculture, on which in the ultimate issue the race depends, could never be carried on by criticism of the weather. If every wind prevented a man from sowing and every cloud kept him from reaping, life would cease. Ignorance is no excuse for inaction and doubt is no reason for perpetual delay. The agriculturist does not wait for the ideally perfect day before he will sow or reap. He waits for the general season for either of these necessary operations, and then trusts to the great laws of the universe. If he spent his time scanning the sky, watching nervously for every breeze of

wind and every drop of rain, it would be proof positive that he was not built for a farmer. Farming needs faith, and cannot be carried on as an adjunct to the meteorological office. Mere criticism paralyzes. A farmer does not choose a blizzard as the time for sowing and a thunder-storm as the time designed for reaping, but the possibility of blizzard and thunder-storm must not prey on his nerves and keep him from his work altogether. The very uncertainty of the future is an argument for industry, for decision to do our own part wisely and well, leaving the rest, which is beyond our control, in faith. To calculate chances too finely will end in doing nothing.

This is a maxim in the practical business of the world. The successful man knows how easily the boundary line of criticism can be passed, and will not let enterprise be choked by caution. The shipper will not keep all his vessels in port because there is a constant menace at sea from storm and fog and collision. It is not his business to let his ships rot in the harbor. He will equip them as fully as possible with care and skill and science and send them out for the harvest of the sea. engineer will not be kept from lighting the fire lest the boiler may burst. He will examine and test and criticise, but he will also proceed to action. world's business could not be done merely by criticism. The genius in practical affairs can wait long and patiently for his opening, but when it comes he seizes it and pushes out his venture. He does not expect the ideal opportunity, and only asks for the practicable. It does not do for a man of action to have his critical faculty too finely developed. The proverb says, " If the iron be blunt and one do not whet the edge, then must he put forth more strength; but wisdom is profitable to direct." If the iron is blunt, whet the edge, but do not be always sharpening

the ax and never using it. It is a fit proverb for many a man who spends all his time perfecting his instrument, furnishing his mind, whetting his intellect for work which he never attempts. If the tools with which we have to work are imperfect and cannot meanwhile be mended, then they have to be used with all the greater skill and strength. Truly, wisdom is profitable to direct.

We can often see in literature and art, as well as in practical life, the paralysis of criticism. A poet may be so finical about the right words, so afraid to venture anything, so concerned about perfecting his poetic apparatus, that he can produce nothing, or, when he does, it may be refined away to mere elegancies of speech without thought or virility. In most cases where the comparison is possible, to compare the first rough draft of a poem with the finished product does not exalt the latter. The strength of the original expression has been rubbed away by undue criticism. The vision, the intuition, the poetic impulse, are often weakened by a too great regard to the formal standards in vogue. It may be even that some Milton is mute and inglorious because he has paid too much heed to the dictates of criticism and would not allow his own spirit to have free course. In all art, such as the interpretation of beauty in painting, or the interpretation of thought by writing in literature or by speech in oratory, the first and chief factor is intuition. It is not attained by analysis, by criticism, by resolving the thing into its component It is creative, constructive, a great emotion which opens the eyes to the beauty or the truth. Criticism is not incompatible with it, nay, is necessary for it at its highest to compare the result with the laws which regulate all beauty and truth; but if it is dominated by a spirit of criticism, by a too great regard for rule and convention, it loses all distinction and takes its place among the great crowd of mediocrity. Has not the paralysis of criticism come over much of our art and literature?

This is true also in other regions of life, as, for example, philanthropy. It is easy to become suspicious of everything that calls itself charity, to harden

the heart because we can point to endless cases where we have been imposed Professional critics of charity tell us that promiscuous giving is demoralizing to everybody concerned, that it only makes paupers and steals away what lingering self-respect may be left to those who accept doles. All that is no doubt true; but there is a real danger of becoming too suspicious, too critical of every story of misery and poverty. Benevolence may have often been abused, but worse than that is callous indifference to the calls on benevolence. man who boasts of never having been taken in is advertising his own hardness of heart. Charity organization is dearly bought at the expense of the extinction of charity itself. We can be too critical about all philanthropic schemes, and find a ready excuse for our own parsimony and niggardliness. Criticism paralyzes beneficence as it paralyzes poetry.

In religion also the same effect of criticism is often felt, and to-day especially is this temptation prominent. Every doctrine, every article of faith, every form of creed, every authority, has been tested and examined. The Bible has been put into the crucible, and the records have been subjected to minute criticism. It is well to note the limitations of criticism. Because theology is in process of restatement does not mean that religion may be rejected meanwhile. Discussions of dates and documents and authorship are useful and interesting, but religion as spiritual experience with a historical past and with a living present does not depend on these discussions. If we live as religious men, we do not live by these things. The forms of religion, its history, its foundations in the past and the present, its formulæ of statement, can all bear investigation. But no microscope or test-tube can alter the fact of it. It is spiritual life, and. like all life, it lives by its own divine right. It is stupid to think that Christian life and work ought to be suspended meanwhile because men are investigating the records of religious history or are criticising the statements of theology. Life must go on, and we cannot call a halt to wait for ultimate decisions of criticism. The literature of religion is

there because the life was there, and not vice versa. The life did not, and does not, depend on the literature. Life does not stop while biologists inquire into the unsolved problems of their science. Religious life does not stop while experts examine the records. Fortunately, we do not need to be experts and original inquirers in order to be Christians.

It is worth while insisting that the Christian life is not accounted for by any sort of literary criticism. The life remains a fact of history and experience. Literature did not create it, and no dealing with the literature can destroy it. The institutions that life creates can be criticised and analyzed, but the life itself cannot be explained by any kind of analysis. An exclusive view of the mere conditions of faith is debilitating. Criticism has its practical limitations in religion, as elsewhere. We have our Christian experience to fall back on, the actual facts of the life of faith. We can wait serenely for every established fact of science; for we know that nothing can affect the ultimate issue. We refuse to let ourselves be driven about by every wind of doctrine. We refuse to stop our

Christian work and life till we are made sure of the dates of the books of the Bible, and have put every record under the lens of the microscope. We must not let our faith be shivered by the paralysis of criticism.

This hesitating, questioning, calculating temper is often merely an excuse for unbelief. A man does not want to bend his heart to the yoke of Christ, he does not want to take on him the sweet burden of faith, he does not want to submit his will to God and to live the life of the unseen, and so he rides off on the plea that he is not satisfied that the fit conditions have come, or he excuses himself by magnifying his intellectual doubts. Christ's claims to the practical allegiance of his life are put off by what is really a sham excuse. Part of Carlyle's great message to his age was that doubt is ended by action. It is quite beyond the point to condone neglect of plain duty by some intellectual quibble. All who loudly question Christian truth need to ask themselves if they have tried the Christian life.

Edinburgh, Scotland.

NUREMBERG, THE CITY OF THE CLOSED SHOP

BY W. D. P. BLISS

TERTAIN voices are singing in America to-day the song of the Open Shop. It means, we are told, liberty, opportunity, Americanism, individuality. It will deliver the country from the threat and peril of the trade union; it will give to the laborer freedom to work long hours, opportunity to accept such wages as employers please, chance to labor on the terms the masters make, liberty to become hand and soul the master's man. It will free the oppressed employer from that paternal or socialistic legislation which is to-day limiting child labor, decreasing the employment of women by night, entailing

needless expense for the safety, the modesty, or the convenience of the workers. "From all these and other evils may the good Free Shop deliver us"—so runs the siren song.

But let us turn from poetry to fact. Let us see what a policy of the Closed Shop actually did do in that one city of the world in which it was carried out most logically and most completely. We refer to ancient Nuremberg. There is nothing that teaches like facts.

Nuremberg to-day is a sea of gables. There rise, indeed, the Imperial Kaiserburg, the ancestral property of the Hohenzollerns; the lordly Rathhaus; above all, the simple yet stately spires of St. Sebald and St. Lawrence, God's

 $^{^{\}rm I}\,{\rm An}$ editorial relating to this article appears on another page.

sentinels over the two parts of the city; there are other towers, but on the whole there stretches out a broad equality, a tableland of gabled roofs. Nuremberg was a city of the people. It had equality, but equality on a high level.

And, noting this, one is struck next by the individuality, the freedom of the houses. You may wander through the city, along the Pegnitz, by the historic mart, down broad streets, through obscure alleys, yet nowhere in Nuremberg find two houses that are alike. Turrets. pinnacles of every size and description. oriel windows, simplest dormer windows artistically placed, carved facades, magnificent towers, winding stairs, picturesque courts, tile roofs—all these, but nowhere two houses that are alike. If Nuremberg was a city of equality, it was certainly one of infinite variety, individuality, fertile wit.

It was a city of success. This breathes from every point. Æneas Sylvius, who wrote in the fifteenth century, says, "The burghers' dwellings seem to have been built for princes. In truth, the Kings of Scotland would gladly be housed so luxuriously as the ordinary citizen of Nuremberg." Nuremberg had no Fifth Avenue, but also no Five Points. No one can doubt the substantial and widely distributed prosperity of the Burgher City.

One wonders still more at the high quality of its life. Equality here spelled Ouality. Art, learning, religion, were universal. There was no artistic set, no learned class, no five per cent. or twenty per cent. who attended church. In Nuremberg, more than elsewhere in the world, the artist was an artisan and the artisan an artist. Her greatest poet was a cobbler. When Adam Krafft carved his ciborium, that "miracle of German art," he represented himself and his assistants in working costume supporting the beautiful creation. When Peter Vischer and his five sons worked twelve years to produce his masterpiece—the shrine of St. Sebald—it was his pride to represent himself at its base in workman's cap, with leather apron and hammer and chisel. Education, too, was popularized. If Gutenberg discovered printing with movable metal type in

Mainz in 1455, Nuremberg, before 1500, had twenty-four presses and had printed two hundred different works. Nuremberg, the city of trade, the Birmingham and Fall River of the Middle Ages, was the first city in Germany, if not in the world, to found a gymnasium, a secondary school for the people. Equally was her religion for all. Vischer wrought his shrine "to the praise of God Almighty above and the honor of St. Sebald." "Here, when art was still religion, with a quiet, reverent heart, lived and labored Albrecht Dürer, the Evangelist of art." Each trade guild had its patron saint, its saint's feast, its guild church or chapel. In St. Sebald's or St. Lawrence's one may still look around on multitudinous carvings or beautiful glass—" Each the bright gift of some mechanic guild who loved their city and thought gold well spent to make her beautiful with piety." Against the walls of St. Mauritz's Chapel still stands the quaint four-hundred-yearold Bratwurst-Glocklein, where, under the shadow of the church and in the very odor of sanctity, Hans Sachs, from generous stein or pewter tankard, "drank and laughed."

It is this commingling of art and of commerce, of learning and of trade, of religion and of daily life, that gives to Nuremberg its greatest charm.

Nuremberg was by no means a perfect city; its citizens were by no means ideal The life we are describing neighbors. was lived five centuries ago, with all its ignorances, its defects, its limitations. The streets were ill kept, if not filthy. Of most mediæval cities one could say what Coleridge says of Cologne-"I counted two-and-seventy stenches, all well defined." The 6,205 "poems" of Hans Sachs were often coarse. government of the city was habitually cruel and harsh, even when just. The subterranean passages under the Rathhaus, the dark dungeons of the castle, the torture-chamber with its horrors, above all, the "Iron Virgin," by which he who was condemned "to kiss the maiden" was seized in iron arms, impaled upon iron spikes protruding from every portion, and which, entering eye and bosom and limb, entailed a horrible death, leaving the lacerated body to drop

upon pointed steel below, to be cut in pieces by revolving knives—all this and much more delivers us from any sentimental desire for the return of "the good old times." Nevertheless, just this, that out of such darkness and ignorance and evil there did arise such art and freedom, such individuality and success, makes us hasten to ask the question how it all arose. How?

We do not hesitate to answer: It arose first and foremost—we do not say solely -because Nuremberg was a city of the Closed Shop. No Nuremberger ever seriously dreamed of leaving trade or art or manufacture or indeed any portion of life to the accident and incident of unrestricted competition. "Competition," the Nuremberger would have said, " is the death of trade, the subverter of freedom, above all, the destroyer of quality." Every Nuremberger, like every mediæval man. thought of himself, not as an independent unit, but as a dependent, although component, part of a larger organism, Church or Empire or City or Guild. This was of the very essence of mediæval life. According to the theory of the times, broadly stated—though more often acted upon than phrased—the town held the right to practice trades as a feudal tenure from the Emperor, who held it from God. This tenure—the right to practice trades—the Rath, or Town Council, parceled out between the guilds or groups of citizens, each guild having the right to practice only that art or even subdivision of art granted it by the Rath. Finally, in its turn, the guild granted to its different individual members the right to practice the trade, conditioned, however, upon restrictions and within very definite limits. Subject to the rule of the Town Council and the overrule of the Emperor, the trade guild held the right to control any detail it would of its especial craft. The guild had the right to say who should practice the craft, and when and where and how. The guild determined what raw material might be bought and how much. The guild determined the number of apprentices any master might employ and the conditions under which they should work. It determined the number of journeymen in any shop, and the wages they were paid.

It held the right to determine, and often did determine, the very methods and mechanism of production. Above all, it fixed the price of the finished product and scrupulously controlled the market. Anything more contrary to the principle of the Free Shop it would be scarcely possible to conceive; equally plainly, the system was paternal, if not socialistic.

It will be said, indeed, and said with truth, that the mediæval trade guild was not like the modern trade union, in that the latter is composed of operatives only, while in the mediæval guilds master and workman, employer and employee, though with fixed order of precedence, nevertheless sat and voted in the same guild. This was true, at least, in the period in which Nuremberg was laying the foundations of her great development. We are not forgetful that the system did not endure. Even under a beneficent feudalism the interests of labor and capital, inherently diverse, broke forth in open strife in Nuremberg as early as the fourteenth century. As masters and burghers amassed wealth and developed power, there grew up, more or less consciously, a trade aristocracy. The masters became jealous of the men and the men suspicious of the masters. The fourteenth century in Germany, as in England and in France, was full of revolution. The artisans evinced a desire to have a voice in the councils of their town. The patrician families had engrossed all the rights. The butchers and cutlers asked and obtained from the Emperor Karl IV. the right to hold a carnival and dance in silks and velvets. This in itself shows ' the prosperity of the artisans. Karl, as repeatedly with emperors, popular for his easy manners and liberal policy, sided with the common people as against the nobles. When the latter favored the Caroline party against the Emperor, the artisans took the opportunity and rose and formed a new Council composed mainly of artisans. This Council, in 1348, allowed the artisans to form separate guilds of their own. Council did not endure, but it sowed the seeds of lasting conflicts between the masters and the men. Karl's successor was not so wise. Wenceslas had been

born in Nuremberg and baptized in St. Sebald's, but he neglected his realm. He cared more for "white beer and girls of various complexions." The struggle in Nuremberg went on till the power of the old guilds was forever gone. But this was the beginning of the end. It shows how much Nuremberg owed to the old system. According to that system little was left to competition. How little will be more clear as we enter into some detail.

Take the vexed question of apprentice-The guild, as we have seen, determined the number of apprentices. According to the rules of the times, the master "must maintain his apprentice night and day in his house, give him board and attention, and keep him under lock and key." Here very surely was the Closed Shop. It does not sound very free, nor very inviting; but listen. The master had to teach the apprentice his trade, with all its mysteries. He must keep no secret back, on pain of losing his license to trade. He must bring up his apprentice in the fear of God, and must see that he attend church. The modern working lad in New York and in London is free not to attend church and to learn little of God; but what apprentice to-day learns half so much of what is to be known of his trade as did the apprentice in Nuremberg of what there was then to be known? And notice still more. When the apprenticeship (Lehrjahre) expired, the young worker was given time and money to travel and study his trade in other countries, for one, three, or even five years (his Wanderjahre). No wonder the Nuremberg artisan produced good work. He was well equipped. If he was an iron-worker, he would go, perhaps, to the Low Countries and see the marvelous iron-work of Antwerp and Liége. If he was a silversmith or goldsmith, he would go to Florence and North Italy. Everywhere he would look and ask and learn. Finally, when he came home, when his Wanderjahre were over, then, while working for a master, he was required to make a masterpiece, and only when he had done this and proved himself a master workman could he be admitted to rank as a master in

his craft. Do we wonder still that Nuremberg workmanship was renowned?

It will be said that Nuremberg's success was based upon thorough training, not upon the Closed Shop. But it was the Closed Shop that made this training possible. The guild did not allow the untrained workman or the mean-spirited trader to cut prices to spoil or steal the market. The guilds measured and weighed and tested all materials, and determined how much each producer could have. The guilds said where materials should be bought. favored the home market. No open market or free trade for them. equally measured or counted, weighed and tested, the finished product. No dishonest goods, no adulterated wares, were to be foisted on the market to deceive the purchaser or lower the price so as to force the honest worker and the conscientious workman to his knees. As late as 1456 two men were burned alive at Nuremberg for having sold adulterated wines. We fear that if, in our open markets, we put to death all who sold adulterated goods, our warehouses would become too much like universal charnelhouses. Wares, the guild laws said, must be, "in the eyes of all, good, irreproachable, and without flaw." To buy in the cheapest and sell in the dearest market was not Nuremberg's commercial law. These guild regulations, indeed, went into every possible and even absurd detail. They determined the working hours. Merry was the day of the vernal equinox when twelve candles were carried in procession and extinguished in the Pegnitz, after which the workman could be employed only till dusk; sadder was the autumnal equinox, when, after the eating of the *Lichtgans* (light-goose), the workman could be required to work till the church bell rang. No workman could be employed on Sundays or on feast days. At first a half and then the whole of Monday was a holiday, save when the men had another holiday in the The guild laws determined even what the artisan should wear and eat. It was a quarrel over this latter item that largely led to the disruption of the old guilds and the development of the journeymen's guilds.

But it was not only in economic matters that the guilds held sway. They legislated in the realm of morals and behavior. Only the right of life and of limb was reserved to the Emperor. The guilds were charitable and benefit societies. Members swore "to show a brotherly love and loyalty to each other, through life, to the extent of each one's ability, to live in peace and kindness one with the other, and in all things to practice Christian and fraternal charity." The guild system thus covered the whole domain of life and entered every province. There were separate guilds for chain-makers, nail-makers, helmetmakers, and spear-makers; there were guilds of architects and tavern hosts, of midwives and women workers. Even the poets had their guild. The Incorporated Poets had pedantic rules for pointing and for meter, for rhymes, and even for punctuation. In 1646 Halsdorfer published a "Nuremberg Tunnel for pouring in the art of German poetry and rhyme, without the aid of the Latin tongue, in six lessons." It will be remembered how, in the "Meistersinger of Nuremberg," Wagner makes Hans Sachs champion the spirit of the old artistic folk-songs against the narrow pedantry of the singers' guild. This is personified in the character of the "Marker," who was the overseer appointed by the guild to mark with strokes the faults committed by the performers, especially if they were candidates for permission to enter the guild. Even Nuremberg's Pegasus was shod in a closed shop.

Nuremberg, however, was not unaware of the dangers of combinations. She saw what they might become, but realized also the dangers of competition, and held the balance between the two evils. A rescript of a commission of the Reichstag, held in Nuremberg, 1522-3, says:

"Item: The aforesaid monopolies, uniting, combining, associatings and their sellings, have not now for the first time been found out not to be borne; but the same were regarded as very noxious to the commonweal and distinctive and worthy to be punished, as aforetime by the Roman Emperors and Jurisconsults, and especially by the blessed Emperor Justinian, so that such trespassers should be made to lose all their goods, and, moreover, should be adjudged to eternal

misery [exile] from their homes, as standeth written. . . Lege Unica Cod. de Monop. . . . But therefore it is not said that all companies and common trading should be wholly cut away. This were indeed against the commonweal and very burdenseme and harmful and foolish to the whole German nation. . . If each one trade singly and should lose thereby, that would then be to his undoing . . such a forbidding would only serve the rich and their advantage, who in all cases everywhere do pluck the grain for themselves and leave the chaff for others." !

Nuremberg thus saw very well that competition only served the rich and the strong, that collective trading was the hope of the poor and the plain people. The guilds were therefore encouraged but controlled. According to the rescript, they could have a capital of only 50,000 gulden, with three storehouses, outside family stores. They must make sworn reports to the town councils. Dispersed companies were not to join. Only limited amounts of material could be bought. They were to be trading companies. Money was not to be lent on usury (interest). The guilds were to serve the people, not to become their masters. Indeed, the guild system cannot be rightly judged unless one take into consideration the control of the guilds by the Rath or town council. This was paternal, often socialistic in the extreme. It was, as we have seen, cruel the children were taught to say a Pater Noster every time they passed the town prison—but it was with a just cruelty. Extortion, false measures, adulteration of goods, were abominations in a trading town and punished usually by death. There was to be no cornering of the market. This was particularly so in the matter of food. The town built granaries and filled them with grain against the day of drought, when they could be opened and the grain sold at low prices to prevent a monopoly price. Nuremberg had four public baths and a town pawn-The town government, if not by the people, was of the people, and most certainly for the people.

Such, in brief, was the system that produced Nuremberg's art and commerce. It most certainly developed freedom and individuality. As early as 1219, Fred-

¹ Quoted in Belfort Bax's "German Society of the Middle Ages," Appendix.

erick II., son of Frederick Barbarossa, declared Nuremberg a Free City, subject to the Emperor only. Few to-day have a conception of the passion for liberty in the fourteenth century, the century of the Peasants' Revolt in England, of the Jacquerie in France, of the ascendency of the socialistic Michael di Lando in Italy. In Germany it was the same, and worked out in every direction. In religion, Johannes Tauler dared to say, "The churches do not make the people holy, but the people make the churches holy." The full influence of this spirit was felt in the Burgher City. Nuremberg was the first Imperial city to declare for Protestantism. Nor did the guild laws fetter the inventive spirit. The first gunlocks, the first air-guns, the first clarionets, the first globes, were made in Nuremberg. In 1500 Peter Hemlein made the first watches, and they were called Nuremberg eggs. That particular alloy which is called brass was first made in Nuremberg, the brass of earlier times being apparently different. The first papermill in Germany, if not in Europe, was established here. A machine for drawing wine was invented in Nuremberg as early as 1360. Printing, as we have seen, though not discovered here, was early introduced. The first playing-cards were printed here; still to-day Nuremberg is the great manufacturer of toys. This is but a partial list of Nuremberg's inventions. The old proverb ran, "Nuremberg's hand goes through every land." A German rhyme said.

"Had I Venice's power, Augsburg's adornment, Nuremberg's wit [inventiveness], Strassburg's defenses, With Ulm's money, I should be the richest in the world."

Open or closed shop? No informed mind will consider it either possible or desirable to return to the mediæval guild or the social system involved in it. No unbiased judgment will desire to see business handed over to-day either to the irresponsible rule of present-day labor organizations, on the one hand, or the uncontrolled organization of capital on the other. On this point, as on all others, we must pick and choose and balance. We present this study of the economic life of Nuremberg, not for what it presents to be copied, which is perhaps nil; but for what it suggests, which is almost without limit. Marvelous quality of work, equality of effort, freedom in inventiveness and creation, grew up largely because by the guild laws the Nuremberg man found deliverance from competition in cheapness of work and of prices. Such are undoubtedly the strong points of a system and a city that America will do well to study. Longfellow has well sung of Nuremberg: "Vanished is the ancient splendor, and

'Vanished is the ancient splendor, and before my dreamy eye Wave these mingling shapes and figures like a faded tapestry.

Not thy Councils, not thy Kaisers, win for thee the world's regard, But thy painter, Albrecht Düter, and Hans Sachs, thy cobbler bard.

Thus, O Nuremberg, a wanderer from a region far away,
As he paced thy streets and courtyards, sang in thought his careless lay:

Gathering from the pavement's crevice, as a floweret of the soil,
The nobility of labor,—the long pedigree of toil."

THE WORKERS

BY MARY G. SLOCUM

All the wisdom of to-day we summon,
And our questions still abide;
Vainly then we look into the future,
Hoping there the answers hide;
While these problems find their one solution
Where the centuries divide.

NEW STUDIES OF MONETARY PROBLEMS'

NUMBER of years have passed since the publication of General Walker's "Money" and Professor Jevons's "Money and the Mechanism of Exchange," and in the interval there have been some important changes both in monetary methods and in the views of economists respecting the principles of currency, banking, and exchange. But until recently English-speaking students have lacked a work comparable with the treatises of Walker and Jevons and utilizing the facts of later research and practice. Within the past year or two steps have been taken to meet this need. Professor Kinley's "Money," for example, is to be commended as a concise exposition from an essentially modern point of view, and Dr. Cleveland's "The Bank and the Treasury" as a trenchant critique of present banking methods in the United States, with especial reference to the necessity for stricter governmental supervision. Neither of these works, however, can compare in point of comprehensiveness with Charles A. Conant's recently issued "The Principles of Money and Banking," which carries the subject from the beginnings of exchange with direct barter to the complicated mechanism of the modern credit system. Mr. Conant is already known as the author of two useful books on financial topics-"Wall Street and the Country" and "A History of Modern Banks of Issue "-and as a member of the Mexican and Philippine Monetary Commissions. As a writer he possesses an agreeable style and the ability so to present the most arid theme that it becomes interesting even to a reader having a minimum of economic knowledge. His present work is distinctly "popular" in treatment, while preserving dignity and caution. It is, we understand, about to be translated into French, and

will no doubt enjoy a wide circulation in the sister republic. For ourselves, although obliged to dissent occasionally from the views expressed and the measures advocated, we have read it with satisfaction, and recognize in it a valuable contribution to a difficult subject.

At the outset Mr. Conant does much to render the student's path smooth by insisting on restricting the use of the term "money" to metallic media for exchange. Paper money, bills of exchange, deposits, etc., are set clearly apart as other forms of currency, and thus a confusing terminology is avoided. This distinction is, of course, rendered possible only by holding that money must contain value in itself, or, in other words, that it is something more than a sign or symbol of value. Mr. Conant further shows that the adoption of money as a substitute for barter was not, as seems to be the view entertained in some quarters, a sudden departure, but a slow evolution in which many experiments were made before it became generally recognized that the needs of exchange might thus best be met-an evolution which has continued until to-day in the gradual extension of credit mechanism to secure elasticity and serve the increasing demands of modern business. the consideration of the function, origins, and development of money our author passes to the principles of the value of money, and here his discussion shows plainly the influence of the Austrian school of economists. Recourse to the principle of marginal utility is, indeed, the only means of explaining satisfactorily the phenomena of rising and falling prices, distribution and exchange, and it is ignorance or neglect of this principle that is largely responsible for the crises through which the United States, like all other money-using countries, has passed. This brings Mr. Conant to one of the most helpful and interesting sections of his work—the study of the evolution of monetary systems.

The Principles of Money and Banking. By Charles A. Conant. Two volumes. Harper & Brothers, New York. \$4, net.

Money Inflation in the United States: A Study in Social Pathology. By Murray Shipley Wildman, Ph.D. G. P. Putnam's Sons, New York. \$1.50, net.

⁶¹⁴

To-day, as is well known, the failure of all attempts to keep gold and silver in concurrent circulation has led quite generally to the adoption of the single gold standard system. This, however, has its objections, and particularly in respect to dealings between gold standard countries and countries still on a silver basis. Various remedial measures have been proposed, notably what is termed " international bimetallism," which. briefly, requires an agreement among leading commercial nations that their mints shall be continuously open to the owners of silver bullion for its conversion into coin at a fixed ratio to gold—a ratio which shall be exactly the same in the case of all nations entering into the agreement. Having recited in detail the experiences of France and the United States with national bimetallism, Mr. Conant devotes a chapter to exposing the difficulties in the way of international bimetallism, which, as he admits, has not thus far been fully tested in practice. The prime obstacle, it appears to him, lies in the impossibility of welding into a homogeneous whole two commodities which are not homogeneous, and he quotes approvingly these words of Raguet: "Between gold and silver there is not any fixed proportion as to value, established by nature, any more than there is a fixed proportion, established by nature, between lead and iron, or between wheat and tobacco. Nature does not say that one ounce of gold shall always be worth so many ounces of silver, any more than she says that a certain number of pounds of iron shall always be worth so many pounds of lead, or that a bushel of wheat shall always be worth a fixed quantity of tobacco." To put it otherwise, statute law would come into conflict with economic law, public opinion would intervene, and the bimetallic agreement would crumble into nothingness. But if Mr. Conant fails to find that the problems involved can be solved by bimetallism, he is equally confident that a solution is in sight through the adoption of the "limping" or "gold exchange" standard, which approaches the subject from the side of adapting the supply of silver coins to the commercial demand for them. plan suggested, and already in operation

in several silver-using countries, calls for the acceptance by such countries of the gold standard on the basis of a silver coin of unlimited legal tender, but with a fixed gold value. "Thus far," declares the author, with enthusiasm, "the experience of the Philippines, Panama, and British India has attested the soundness of these principles by their successful operation."

Problems of currency and banking occupy the major part of the second volume as well as a goodly portion of the first. Naturally, the difficult question of power of issue requires considerable discussion, and here, perhaps more than anywhere else, Mr. Conant leaves himself open to criticism. The treatment is hardly sufficiently luminous, and at times the economist appears to be lost in the banker, with the result that the outlook is somewhat narrow. The ideal currency system, in Mr. Conant's opinion, is one which combines the single metallic standard with the issue of convertible bank notes. Coinage he would reserve for the State, but would lodge note issuance with the banks, leaving to the Government merely the right to make regulations to insure soundness. "Government paper money," he explains, "cannot easily be regulated in quantity in accordance with business demands. Attempts at such regulation must be more or less artificial, because government paper is not issued in response to pressure for credit in the money market, as bank notes are, but is issued to meet the needs of the State or at the judgment of some official. If the quantity becomes excessive, it cannot be exported like money of standard metal. If it is redeemable in the standard metal and the quantity becomes excessive, by reason either of an increase in the quantity of paper or a decline in the volume of business, there is always danger that demands for redemption will impose a heavy burden upon government reserves of metal. The government is subjected to much greater difficulty than a bank in maintaining the redeemability of such money, because the bank has means for calling in its money, reducing the amount which it lends to the public, and thereby curing the excess in circulation without losing the entire amount of the excess from its reserves."

Mr. Conant does not, however, range himself with those advocates of typical bank money who allege that the requirement of special guarantees for security is unnecessary. He would follow the Canadian system of a guarantee fund whereby the banks combine to make good the full value of notes in cases of bankruptcy; he justifies the requirement of specific cash reserves, and he urges restriction of issue within the limits of legitimate business demand by a system of prompt redemption for notes, and by changes of the discount rate; both of which measures, it is pointed out, aim at the vital necessity of keeping bank notes exchangeable for coin at par and on demand. But, with reference to the system in vogue in this country, he specifically criticises the provision of the National Banking Law "which takes the security for the notes out of the custody of the banks, and deprives them of that ready control of their note issues which permits their adaptation to business conditions. Such regulation hampers sound banking, tends to increase its cost to the community, and is not justified by experience for the purpose of insuring the safety of the notes." The present system is undeniably faulty in some respects, but it is admirably designed to meet the needs of the American people, and among its most useful requirements is that relating to the depositing of United States bonds with the Treasurer of the United States as security for note issues. The need for greater elasticity is obvious, but any system which is devised to insure greater elasticity must also insure a constant and central redeemable value to the paper currency. This value, in our opinion, must always be given by Any monetary government guarantee. reforms which may be undertaken should be in the way of adapting, not revolutionizing, the existing system.

Dr. Murray S. Wildman's "Money Inflation in the United States" is a book of an altogether different order from Mr.

Conant's. It is the outgrowth, it appears, of an investigation undertaken in a seminar of Professor Laughlin, of the University of Chicago, and is, as its author describes it in his sub-title, a study in social pathology. Dr. Wildman views the "periodic chase after the phantom of value created by legislative enactment" as a symptom of social disease. Analyzing, from both the psychological and the economic standpoint, the several movements which had their culmination in Shay's Rebellion, in the war upon the second Bank of the United States, in the greenback agitation, and in the free silver campaign, he endeavors to determine whether or not the United States is likely to be the scene of any more attempts to "tamper" with the standard of deferred payments. Both his method and his reasoning are ingenious, and although it seems to us that he presses a hypothesis to an extreme, we have found his little treatise singularly stimulating. In every case he traces the demand for currency expansion to a wave of westward colonization, finding as underlying factors, on the one hand, the mental states produced by the isolation of the colonizer; on the other, an undue reliance on the increase of wealth through the growth of population and a consequent increase in demand for land and farm products. Now that the frontier, "in so far as it forms an important element in American society," is a thing of the past, and the railway, telegraph, telephone, and rural free delivery of mail, etc., are narrowing the zone of "isolation," the dangers of "inflationism" are that much diminished. But sundry inimical tendencies remain, and the conclusion ultimately reached by Dr. Wildman is that "Not until the people see the fundamental principles at stake will the country be safe from false monetary doctrine. So long as men go into debt, they will seek the shortest way out. So long as speculation proves profitable, men will go to the limit of their credit in good times and find themselves insolvent in times of depression."

Comment on Current Books

American Men of Science Begun as a reference list for the Carnegie Institution, this biographical dic-

tionary is offered as a contribution to the organization of science in this country. It includes the names and records of over four thousand scientists, and is especially full in the entries relating to those who have carried on research work in the exact and natural sciences, with a considerable representation, however, of teachers and writers, and of men who through applied science (as in medicine or engineering) have contributed to the advancement of pure science. The complete membership of a long list of scientific associations was used as a basis. The work is evidently prepared with care, and its usefulness is obvious. (The Science Press, New York.)

In Mr. Ira D. Sankey's story of As Jesus his life and work mention is Passed By made of a gipsy lad converted under his influence. The author of the addresses in this volume is that lad, now the influential evangelist, Gipsy Smith, widely known and esteemed in the British churches. The reader who is aware that the preacher never slept in a house till he was seventeen years old, but roved the country in his father's band of nomad tent-dwellers, becomes aware of a divine power in the Gospel which so transformed him. These discourses, published only under friendly pressure to publish, reveal the glowing heart of a plain but evidently inspired man. They are marked by virility, "very straight talking," and ethical vigor. (The Fleming H. Revell Company, New York. \$1.)

Peter, and The Revelation of John

The Epistles of These volumes of the "Devotional and Practical Commentary," under the editorial direction of Dr. W. Robertson Nicoll, editor of the

"British Weekly," the former by the Rev. J. H. Jowett, Dr. R. W. Dale's successor at Birmingham, and the latter by the Rev. C. Anderson Scott, follow the line of the widely known "Expositor's Bible." Mr. Iowett abstains so far from the field of criticism as not to mention even the generally received belief of critics, that the second of the Petrine letters is from a later hand than Peter's. His exposition is wholly concerned with the intrinsic value of the Epistle, and with its general lessons, together with their specific bearing upon present-day conditions. Mr. Scott's exposition of the Apocalypse is

marked by fine appreciation of its literary structure and pictorial form, together with a sane and satisfactory perception of the cyclical unfoldings of its general theme—the judgment of the sinful world in successively widening areas. (A. C. Armstrong & Son, New York. \$1.25, net, per volume.)

The Evangel of the New Theology

The Gospel as viewed by the "new theol-

ogy "-which is really old theology newly revived—is presented here both doctrinally and practically in its religious and ethical aspects with a clearness and fullness rarely found. The author of these twenty discourses, the Rev. T. Rhondda Williams, of Bradford, England, has thought his way through the intellectual confusion of our time, and is a proper spokesman for a growing body of such thinkers. The basal question of religion, as he observes, is the relation of God to the living world. The theology now being outgrown conceived of God and man as external to each other, beings apart, and out of this fallacious dualism the Unitarian controversy grew. But "the gist of the new theology" is the oneness of the spiritual nature in God and man, so that humanity itself is "an incarnation of the divine life." The charge that this is "Unitarianism" Mr. Williams rebuts on historical grounds, and with a discriminating statement of the likeness and the difference. Trinitarians and Unitarians have moved off their old grounds, and in moving to higher ground have approached each other. Many other vital questions are discussed here. "Does Evolution Account for Jesus?"-answered in the negative, but with showing that Jesus is not a solitary instance of the fact-is a noteworthy specimen of these. The unfriendly doubt whether "the new theology" has a true "evangel" is well met by this book. It is marked by warmth as well as freshness and force, and by intentness on the realities of religious faith. (Charles Scribner's Sons, New York. \$1.50.)

Dr. C. W. Saleeby is an en-Evolution the thusiastic Spencerian. His Master Key present "discussion of the principle of evolution as illustrated in atoms, stars, organic species, mind, society, and morals" undertakes to expound and vindicate the "synthetic philosophy." Clearly enough, Spencer was no materialist. And when his "unknowable" is here explained to mean merely incomprehensible, he locks arms with pious Job. The supreme idea bequeathed by Spencer is, in Dr. Saleeby's opinion, this: "May there not be a mode of being as much transcending intelligence and will as these transcend mere mechanical motion?" This is his conjecture of the nature of the ultimate Reality. Of this Dr. Saleeby permits us to affirm that it is intelligible and intelligent; but the question whether it is benevolent he regards as "meaningless anachronism." Yet while this partial knowledge of Spencerians concerning the Eternal in no way affects, as he says, their conduct or their happiness, it appears that it does affect it so far as this: it is of such a nature as to leave them free to hope and to work for the best. Not being against them, it may be for them. Beyond his exposition of his great master, " an immortal," it does not appear that Dr. Saleeby has contributed anything of importance upon the subject of evolution. This, after all, is not, as he calls it, a "principle," but simply the method in which, to use Spencerian terms, the homogeneous becomes the heterogeneous. (Harper & Brothers, New York. \$2, net.)

Mr. S. R. Crockett is a Fishers of Men facile teller of tales, and although he is too much given to springing some lurid and dime-novelish incident upon a reader who wants rather to have more of his clever character-sketching, sprightly dialogue, and attractively depicted and lively girls, there is always enjoyment to be had from his books. We could very well spare in this story, for instance, the insane valet who lives in his dead master's tomb, issues forth to scare people by his ghostly walks, and commits a murder for which another man is nearly hanged. But one could ill spare the devoted little city missionary, Mr. Molesay, who, in a beautifully human, devoted, and non-pietistical way, is shown among the burglars and toughs of Edinburgh's Cowgate. The hero of the story is a lad who has the advantages of a high-class finishing school in artistic burglary, but insists on turning out straight and square; and some of the most interesting scenes are in a boys' reformatory. Altogether a badly constructed but decidedly readable book. (D. Appleton & Co., New York. \$1.50.)

History of the English Bible Wright of Bishop Westcott's work, which first appeared Macmillan Company, New York. \$3.50.)

Japan as a Great Power Does Japan really constitute a "yellow peril," or does she, on the contrary, make the world's civilization greater? The present volume is written by one who strongly

believes that what Japan has accomplished has been in the interest of civilization, Oriental and Occidental. Dr. Seiji G. Hishida carefully traces Japan's historic policy in dealing with foreign nations. Incidentally he makes frequent reference to the diplomatic and commercial history of Europe and America, to the principles of international and other law, as well as to certain phases of economics and sociology, in order to elucidate with scientific precision the relations between the Orient and the Occident. Dr. Hishida's volume has distinct value for students of history and politics. We are informed as to the early intercourse of Japan with Korea and China, ancient nations indeed, for, like the Jews and the Egyptians, so the Chinese and Koreans claim to be able to trace their national existence back to a time centuries before Solomon erected his temple at Jerusalem. Dr. Hishida does not enter into the myths and legends of Japan, but declares her national history to have begun with the Emperor Jinmu, the first Mikado, who established a capital at Kashiwabara, B.c. 660. The first intercourse of Japan with European nations, however, did not take place until about twenty-two centuries later, despite the fact that Japan had been described to Europe by Marco Polo at the end of the thirteenth century. After narrating the history of ancient and modern Japan, Dr. Hishida describes the Empire's definite entry into the comity of nations, the Russo-Japanese rivalry in Korea, the various struggles of the great Powers in China, the Boxer rebellion, and the Russo-Japanese war. An appendix appropriately contains the text of the Russo-Japanese and Anglo-Japanese treaties. As might be expected, Dr. Hishida believes that Japan has a distinct mission and that she is accomplishing it with credit to herself and to the world. By the publication of this painstaking study the world should the better appreciate how this has been accomplished. (The Columbia Press, New York.)

There are very many who in Method in the matter of personal relig-Soul Winning ion have lost their way in the woods, and need to be put on the trail that leads out into the open. Whoever would do such service for another will find this book one of rare value. It is written by one who, having learned how to do it, would impart his method—Dr. Henry C. Mabie, Secretary of the Baptist Missionary Union, and for-merly a successful pastor. "It is amazing," he says. " how little truth is essential to salvation," if one will only be loyal to the modicum of truth he possesses. Loyalty to the truth one has in hand is saving faith. Following a single ray of light leads out of the cave into the day. Ethical rectitude as well as religious earnestness dictates this course. Dr. Mabie's narratives of many difficult cases in which he applied this method with happy effect, together with his judicious cautions against tactical mistakes, are both instructive and stimulating. (The Fleming H. Revell Company, New York. 75 cents, net.)

Some very strong objec-Old Testament tions can be brought, as Introduction eminent scientists like Faraday have confessed, against the theory of gravitation, but it is universally accepted notwithstanding. Likewise the consensus of critical scholars upon the documentary theory of the Pentateuch, and other innovations on traditional beliefs concerning the composition of the Old Testament, are open to a variety of more or less plausible objections. These are here urged by Professor John Howard Raven, of the Theological Seminary at New Brunswick, N. J., in a fair and manly argument, to which is appended a select bibliography impartially referring both to allies and adversaries. Professor Raven's contention against "the insidious nature of the current views" seems motived by his fears. Back of these seems to be the fallacious assumption that the religious faith which produced the Scriptures must stand or fall with a theory of the mode in which the Scriptures were produced. (The Fleming H. Revell Company, New York. \$2, net.)

The Sacred Cap In this story by Vincent Brown an English rector, who, in spite of the awesome presence of his Bishop and the social power of the great folk in his parish, persisted in living up to the standard of the Prayer-Book, came to temporal grief but spiritual exaltation. He withheld the Holy Communion from a prominent member of his parish because of impenitence for acknowledged sin. There is decided ability and moving power in the scenes when the quiet, timid little rector stands true to his religious conviction and sacrifices his interests and his human ties. (G. P. Putnam's Sons, New York. \$1.50.)

The Sea Maid

There is always a fascination about tales of shipwrecked or stranded people, and it is from this romantic element that Mr. Ronald MacDonald's tale draws its interest. The seizure by a somewhat too theatrical villain and his accomplices of a steamship carrying a large consignment of gold and the enforced landing of the passengers on a remote island, where they find a little family shipwrecked

many years ago, is the starting-point for various incidents and love-making. The "sea maid" is the daughter of the English clergy-man who, with his wife, inhabits the island when the others arrive, and was herself born there; so that she had known only two living people. She is quite charming in her naïvet!. The fault of the story is that it mingles the romantic, the burlesque, and the melodramatic rather indiscriminately. (Henry Holt & Co., New York. \$1.50.)

In this story by Mrs. Lu Wheat, The Third of Los Angeles, Ah Moy, the Daughter third daughter of a good family. is the central figure in an idyllic picture of a Chinese home. This at length is broken up by dire calamities, which give occasion for the display of high qualities of character, but bring Ah Moy to a tragic end. Chinese customs, the position of women, foot-binding, sex-morality, the Boxers, the traffic in slavegirls, their importation hither, and the efforts of missionaries to thwart it, make up the rapidly shifting scene. To study her subject Mrs. Wheat visited China with an introduction from Minister Wu-Ting-Fan, and writes in large sympathy with whatever she has seen that is attractive and worthy. Concerning Christian missionaries there she has not taken equal pains to inform herself correctly. (Oriental Publishing Company, Los Angeles.)

It is more than a year and The Writings of a half since the publica-Samuel Adams tion of the initial volume of this handsome edition of the writings of the "penman of the Revolution." The second volume, at last in hand, includes the articles, resolutions, letters, etc., written by him from January, 1770, to February, 1773. These have to do almost altogether with the subject which was his master passion-the securing of a larger measure of self-government for the colonists and the abolition of policies repressing their activities. Throughout. whether writing of the non-importation agreement, the Boston massacre, or the stamp tax, the dominant note is an appeal to the people to unite for the preservation of their liberties. And, as the years pass, it is easy to detect an increased intensity and vehemence; and always, beneath the rhetorical flourishing, an obvious sincerity. Extended comment must be deferred until the completion of the work, but this we may say-that whoever desires a vivid first-hand presentation of the case for the Colonies in the conflict which immediately preceded the War of the Revolution will be well advised to secure this collection. (G. P. Putnam's Sons, New York. \$5.)

Letters to The Outlook

LETTER FROM A RUSSIAN LEADER

Believing that part of a letter from St. Petersburg, dated February 3, 1906, will interest the readers of The Outlook, I am sending you a translation of it. The letter was sent me by my father, Ivan Ilyitch Petrunkevitch, President of the Russian Agricultural Society and member of the Zemstvo of Twer, who is at the same time leader of the Russian Constitutional Democratic party. Readers of The Outlook may remember that he was one of the deputies received in audience by the Czar after the horrible events of the "Red Sunday," and also his later speech in which he said: "The wall surrounding the Czar is too strong; there is no hope for reforms. We can count only upon ourselves and upon the people. Let us say this to the people. No need of ambiguity. Thanks to the Government, a situation has been created which gives sanction to the revolution. The revolution is a fact. We are obliged to turn it aside from the path of bloodshed. We shall go for that purpose to the people. shall earn their confidence. It is necessary to tell everything courageously to the people. We have to go with petitions, not to the Czar, but to the people."

Twenty-seven years ago he was banished without trial by order of Alexander II. for an address which he wrote as member of the Zemstvo of Tchernigoff and signed, together with some thirty other members. This address was in its essence nothing less than a petition for a constitution, but, owing to the strict Russian censorship, little is known about it in foreign countries, or even in Rus-In 1894 Mr. Petrunkevitch, together with other members of the Zemstvo of Twer. where, after several years of banishment, he was finally permitted to live and work, signed that well-known address of the Zemstvo of Twer to Czar Nicholas II. upon the occasion of his coronation, in which was a plea for an establishment of direct relations between the Czar and his people, without the intermediary of the Ministers (the address was written by Mr. Roditcheff). For his participation in this address, for these now celebrated "senseless dreams," as the Czar designated them in his answer, Mr. Petrunkevitch has, with all the other members of the zemstvo, received a public rebuke from his Majesty. Yet these same senseless dreams have guided him and many other liberal Russians through the whole of their turbulent lives, and are, it may be, at the present time nearer than ever to a realization of some kind—of a kind, perhaps, least expected by the vacillating but always reactionary Czar.

ALEXANDER PETRUNKEVITCH.

21 Jan. 1906. 3 Febr. 1906. St. Petersburg.

... You know many things from the papers, but the papers present in the majority of cases only the external side of events, measure affairs by a scale so great that all characteristic and often very important details are completely lost. . . .

At the time when our deputation was received by the Czar, the movement had scarcely begun and we were at the head of it. Now all Russia is swept by a revolutionary conflagration; all is under martial law; everywhere runs blood; people are arrested and shot with trial or still oftener without any trial; estates burn; factories and mills are closed; masses of workmen hunger without work; all the universities and the majority of high schools are closed; in the streets of the cities, including St. Petersburg and Moscow, the black band reigns and no one's life is safe. I myself have received several death sentences from different "patriotic parties," i. e., those that understand under patriotism a return to the old régime. In one word, here reigns full chaos. The whole mass of the people is revolutionized, and in the spring we expect an enormous agrarian movement. The Government is entirely unable to rule the country, but leads a ceaseless police war, fruitless, and, what is still worse, one that infuriates peasants and workmen and the educated class. Notwithstanding all this, the country gradually forms itself into several parties, and the agitation before the elections to the Imperial Duma begins. But the election law itself, as well as the lack of political training of the masses, makes of the elections a veritable lottery, so that it is absolutely impossible to predict the results. Therefore I do not know anything about my own election either. My election, as my defeat, will be a matter of chance. . . .

Our party, the Constitutional Democratic party, was the only one which, after the crushing of the social-revolutionary rising in Moscow, did not move toward the right, and which will in the coming sitting of the Duma doubtless uphold reforms of a political and social nature in the spirit of democracy. We must therefore expend much effort in order to elect as many members of our party as

possible to the Duma. In addition, we founded here a newspaper, which was forbidden after five numbers appeared. We founded another paper, which was also forbidden after two numbers were issued. Now we have asked permission to publish a third paper, and hope to get this permission during the present week. At the head of the paper stand Professors Milyoukoff and Hessen, both having great authority not only in our own party but in the country at large. Scientific work in Russia is scarcely possible, and the majority of professors, those at least who work, now spend most of their time in meetings and not in laboratories. In the last days a resolution was passed by the Committee of Ministers to keep the universities closed until autumn, as it is evident that in any university or technical school instead of lectures public meetings would be arranged. I doubt, however, whether these institutions will be opened in the autumn, as the revolutionary fermentation cannot soon cease, while the meeting of the Duma cannot appease the agitation, especially if the body of the Duma shall be reactionary. Still, we have to hope that the constitutional régime will sooner or later appease the country. . . .

HIGHER EDUCATION IN FLORIDA

Last summer The Outlook published a paragraph on the educational situation in Florida, which appears to me now, after coming here and observing the situation for some time, to have misrepresented the conditions in some respects. That it did create a wrong impression is evidenced by the fact that several asked me if the State had not abolished its University.

The last Legislature did abolish the University, and along with it five other institutions supported wholly or in part by public funds which were claiming to do collegiate work. In all cases they were also doing secondary work. When these schools presented their claims to the last Legislature and asked for \$750,000, the lawmakers demurred. Instead of the appropriations asked for, the Buckman Bill was passed, abolishing all six of the institutions at one fell swoop, and declaring their property forfeited to the State under certain conditions.

This destructive feature of the bill was emphasized in the paragraph published in The Outlook; but this was only a work of preparation. It was the result of a wish to stop wasting the resources of the State through scattering them, and to increase its power for effective work through concentration. The constructive features, which are more noteworthy, may be stated as follows: In

place of the six schools abolished, it provides for two institutions of higher learning—one for boys, to be known as the University of the State of Florida; and one for girls, the Florida Female College-and creates one Board of Control for these and for the Colored Normal School and Deaf, Dumb, and Blind Institute. A normal department is to be maintained at the University and at the College for Girls. By statutory enactment, before students can enter the University they must present certificates of graduation from a high school maintaining the twelfth grade. or other evidence of equivalent training, and from the tenth grade to enter the College for Girls, though the Board is empowered to alter this. Another bond was taken of fate in the effort to make these institutions the head of the educational system of the State. The Board of Control, acting always in conjunction with or subordinate to the State Board of Education, is empowered to provide a system of written examinations for admission to and advancement in the public high schools.

If the system is open to criticism anywhere, it is in the extensive and minute powers vested in the Board of Control. However, if these powers are wisely used, all will be well. So far no steps have been taken to assume control over the public schools.

The Board of Control and the Board of Education were directed to locate the two institutions, and they have placed the Female College at Tallahassee, and have selected Gainesville as the permanent seat of the University. For the present it is located at Lake City, and is using the grounds and buildings of the old University. A faculty was secured which will favorably compare with the teaching force of any institution of like resources in the country. Nine of them have the Ph.D., and represent the best universities of America and Europe. The entrance and gradution requirements are a decided improvement over those of the old University, and will compare favorably with those of most of the universities in the South. The State, then, has not left her youth without any provision for higher education, even for a year, as the paragraph referred to intimated would be the case.

Gainesville, the permanent home of the University, is one of the most beautiful and progressive towns in Florida. Its public spirit was shown in a large donation for the University. The plan adopted for the University is very elaborate, and calls for the expenditure of \$1,500,000; consequently it will require considerable time for its realization, as the State is not able to appropriate so much money at one time. However, a begin-

ning has been made, and contracts have been let for two buildings, which are to be ready for occupancy next September. The foundations are being laid for a university of which the State may one day be proud.

DAVID Y. THOMAS.

University of the State of Florida.

[We are glad to have this report of progress. A letter from Mrs. E. H. Sellards, of the University of Florida, printed in The Outlook of July 29 last, must, we think, have removed any misapprehension from the paragraph in question.—The Editors.]

CHILD LABOR AND WOMAN SUF-FRAGE

Having noted with interest the use which The Outlook makes in its issue of February 24 (p. 382) of a portion of my report as Chairman of the Industrial Committee of the National American Woman Suffrage Association, presented to the recent Convention at Baltimore, it occurs to me that you may be disposed to give space for my interpretation of the facts cited.

I am convinced that the enfranchisement of women is indispensable to the solution of the child labor problem, and I cited the conditions existing in Maryland, in New York, and elsewhere, in support of this view. In Maryland, where children work all night as messengers and telegraph boys, and in glassworks, while men and women sleep, women have never voted, and have made but limited use of the right to petition which they possess. The children of Maryland are suffering from this failure of the women of Maryland to protect them.

In Georgia, where no protection is afforded to working children, little girls work in cottonmills all night at the age of six, seven, and eight years. In that State women have used their right of petition five years on behalf of the working children, and have achieved nothing for their protection. Women in Georgia have no vote on any subject.

In Illinois women have used the right of petition with increasing vigilance and energy for more than a generation. There, children

do not work at night, though the largest glass-bottle works in the world are at Alton, Illinois, and the messenger service of Chicago is second only to that of New York City. The effort for the protection of the children in industry in Illinois is, however, a ceaseless, wearying struggle. Only last year, for instance, the appropriation for the State factory inspectors' expenses was cut in half, and the present energetic officer was kept in office only by long-continued protest of women's organizations against his removal.

The amount of exertion required of the disfranchised women of Illinois for the protection of the working children alone is greater than that required of the voting women of Colorado for the performance of

all their political duties.

In the four States in which women vote on all subjects, child labor and illiteracy have ceased to be problems. Nowhere in the industrial world are children so effectively safeguarded in life, limb, health, education, and morals as in Denver, where mothers and teachers unite to keep in office the justly famous Judge Lindsey of the juvenile court, overcoming (with the help of a minority of politically independent fathers) the united efforts of the Republican and the Democratic bosses against him.

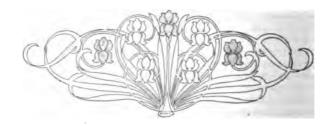

In contrast with the good fortune of the children of Denver is the plight of the halfmillion illiterate children in the thirteen Southern States in which women have no vote and make slight use (if any) of the right

of petition.

In New York City, also, where women have no vote, the young children pay the penalty of the disfranchisement of their mothers and teachers, as is shown by the facts cited by The Outlook (February 24, p. 283).

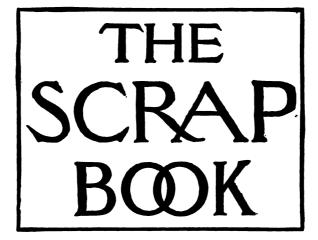

It is largely because these facts and many others like them have come to my attention that I am serving as Chairman of the Industrial Committee of the National American Woman Suffrage Association.

FLORENCE KELLEY, Vice-President N. A. W. S. A. Hull House, Chicago.

The Sweetmeats of Literature

To the greybeards of America, and to their gentle companions with silvery hair; to the people of middle age, and to those who have passed beyond early youth—to you all

will bring back to your mind and heart the delight that a piece of mother's pie would bring to your palate—a big, juicy piece that used to taste so good, so unspeakably good, in the hungry play days of youth.

The Sweetmeats of Literature—old familiar friends, coming back to you in THE SCRAP BOOK—poems, anecdotes, declamations, humorous stories and humorous bits; pathetic stories, too, half-forgotten hymns, lost facts, quaint and curious things, absorbing incidents, jokes, satires, and stories that once set your youthful fancies ablaze and opened up the big world to your vision—all these and a thousand things more arc in THE SCRAP BOOK.

It is such a treasure-house of new things, and of old things collected from the archives of the century, as have nev r before been gathered together or even dreamed of.

THE SCRAP BOOK is the hit of the century in magazine making.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

LETTERS should be addressed:

Copyright, 1906, by the Outlook Company. Entered as second-class matter in the New York Post-Office.

Let your boy make a playground of his bed, if he wants to.

Let him have his cat or his dog or his toys with him.

What difference does it make, anyhow? Blankets are durable; and easily cleaned—if you go about it in the right way.

The best time to wash them is on a warm, sunny, breezy day in spring.

The best way to wash them is with Ivory Soap.

Follow the directions given below and your blankets will be as clean and soft and fluffy as when you bought them:

First, shake out the dust, then soak them in warm suds of Ivory Soap for thirty minutes. Work them up and down in the water, squeeze them against the side of the tub, and put them through the wringer, loosely adjusted, into another strong suds of the same temperature as the first. Stir about and soak for ten minutes, stretch soiled parts over a smooth surface, and rub with a brush, using a little of a solution of Ivory Soap cut up and dissolved in hot water. Rins as ever a warm waters—or until both blanket and water are clean—then hang to dry in the open air. Hang the blankets so that they will dry straight. When perfectly dry, rub the surface with a soft flannel cloth and hang them near a stove or in a warm room for several hours. For each pair of blankets, allow a half cake of Ivory Soap.

Ivory Soap-99 11/100 Per Cent. Pure.

The Consular Service

The duty of our Consular Service is to enhance Ameri-

can interests and prestige abroad. In the vast majority of cases these interests are commercial; in certain instances they are diplomatic also. At present the famous, or rather infamous, doctrine, "To the victor belong the spoils," still holds unnecessary sway in consular appointments. It has two inevitable results: first, candidates have too often been appointed, not because of their fitness in character and attainments to represent their country abroad, but because of a particular party service at home; secondly, changes in Presidential administration bring wholesale changes in the Consular Service. As to lack of character, we have seen what has happened when consuls have "found themselves in remote Eastern ports, where there was not much that made life attractive, where there was very little supervision over them, and yet great temptation," to quote President Roosevelt's words last week to the delegates in attendance at the National Consular Reform Convention at Washington. As to lack of attainments, our consuls in general have not been conspicuous by reason of their knowledge of languages, of international law, or even of trade conditions at home and abroad. If unfitness in the appointees and lack of permanency of tenure seem the greatest evils of our present system, a third is found in the haphazard method of payment, whether by salary or fee: most consulates are underpaid; a very few are disproportionately paid. As Mr. Roosevelt says: "We cannot keep the service as high as it should be kept unless we have adequate salaries. Remember that the dearest kind of public servant is a servant who is paid so cheaply that he must render cheap service." Salaries could

have been increased without adding to the cost of the service if, instead of an undeviating fee for authenticating or legalizing invoices, we had a system of graded fees; the foreign producer who sends to us a shipment valued at a hundred dollars pays just the same amount for having his invoices legalized as does a shipper who sends a hundred-thousanddollar shipment. Of course in such an unscientific consular service there is no provision for old-age pensions. of our present consuls, who have been continued in office through Presidential changes, are, because of advanced age, somewhat incapacitated to perform their required duties. Nor is there any system by which consular officers who do not reach a specified grade by the time they have reached a certain age are dropped from the service, or any by which those are dropped whose record for efficiency does not reach a certain standard.

The Consular Service as It Should Be

consular service.

through Senator Lodge, recently sub-

mitted a consular reform bill to Con-

gress which, in its entirety, ought to

pass that body, since it asks, not for a

service; its only excuse is that it grew out of conditions when we were expending all our energies at home. During recent years, however, definite executive efforts have been made towards amelioration. Secretary Blaine tried to secure the appointment of wellequipped men. President Cleveland rendered conspicuous service in providing for the examination of certain candidates, and President Roosevelt an even greater in extending the scope of Mr. Cleveland's order and in systematically purging the No Secretaries of State have been friendlier to reform than Secretaries Hay and Root. The latter,

Ours has thus been

an uneven consular

full, but only for a modest measure of reform. Among other things, it provides for an examination of all candidates for appointment, particularly in connection with their knowledge of commercial affairs and foreign languages; a recall within one year of every officer now in the consular service for the purpose of re-examination to ascertain his fitness to remain in the service; a classification and grading of all consular positions, defined by the salaries paid; a payment of all fees into the United States Treasury; a power to promote consuls on merit from lower to higher grades, and to transfer consuls from one post to another in the same grade without making new nominations to Congress; and the appointment of consular inspectors, whose duty should be to visit biennially every consulate. The Senate, eliminating the clauses providing for examination and promotion, passed the rest of the bill. The House Committee has eliminated the clause providing for transference. While chagrined at this loss, Senator Lodge declared to the National Consular Reform Convention last week, in part in the language of The Outlook on the same subject some time ago: "I accept half a loaf when I cannot get a whole one. Let us get this bill through if we can, and then we can provide for further improvement as the service develops." Representative Adams, the champion of consular reform in the House, urged the Convention not to expect ideal legislation. but to do two things immediately: to bring power enough to bear on the Speaker so that he will allow the bill to come up, and individually to bring pressure on the Representatives. Secretary Root also advised in like manner. cordingly, the Convention in a body, after visiting the President, called upon Speaker Cannon, and put itself on record by adopting, among others, the following resolution:

It is the opinion of the constituent bodies of this Convention that the consular service of the United States should be recognized as provided for in Senate bill 1,345, introduced by Senator Lodge December 11,1905. Every feature of that bill is, in the judgment of the business organizations of the country, most essential and in harmony with 'the growing need of the United States.

The city of Chicago Chicago's Great won an important vic-Traction Victory tory before the Supreme Court of the United States last week when that tribunal handed down a decision holding the so-called ninetynine-year act not to bear the interpretation placed upon it by the companies. This act, passed in 1865 by the Illinois Legislature, extended from twenty-five to ninety-nine years the corporate life of the Chicago City Railway, Chicago West Division, and North Chicago City Railway companies, operating in the south, west, and north divisions, respectively, The act also of the city of Chicago. contained a clause extending "during the life hereof" the contracts or licenses to occupy the streets of Chicago made a few years before by the City Council for twenty-five-year periods. This clause was understood at the time to extend the life of the franchises to occupy the streets from twenty-five to ninety-nine years, and was vetoed by Governor Oglesby for that reason, and passed over The companies have always the veto. contended that such was the effect of the legislation, and their contention was squarely upheld by Judge Grosscup. The city, on the other hand, has steadily refused to recognize the validity of the ninety-nine-year act, and the companies, as a matter of fact, have never rested their right to operate on that act alone, but have always had, in addition, Council authority. In 1883, when the twentyfive-year grants made in 1858 should have expired according to the terms of the Council ordinance, the Council passed blanket twenty-year extension ordinances, with the stipulation that neither the companies nor the city thereby waived the right at the expiration of the period to claim that the act was or was not valid, as suited the interests of the respective parties. With the expiration of the twenty-year period in 1903 the ninety-nine-year act again became a live issue.

The Effect on the Street Railways
in the west and north divisions of the city, was placed in the hands of re-

ceivers named by Judge Grosscup, of the Federal Circuit Court, on a creditors' bill, on the petition of persons believed to represent New York holdings of traction stock. Then began the litigation to determine the rights of the companies, which resulted in the decision of last week. Judge Grosscup held that the clause on which the decision turned could have no meaning unless it was intended to extend for ninety-nine years the franchises of the companies. The Supreme Court did not pretend to interpret the clause or give it meaning. That body merely said that the clause "during the life hereof" as used in the act was ambiguous; that corporate privileges can be held to be granted as against public rights only when conferred in plain and explicit terms. Therefore the act in question merely extended the corporate life of the companies, and did not operate to lengthen their franchise rights in the streets. In other words, the men who secured the legislation of 1865, in their desire to accomplish their object without clearly stating it, failed through timidity to make the language strong enough to satisfy the Supreme Court that the act really did encompass the purpose intended. The decision ought to have a healthy influence in promoting clearness of statement in all future legislation of this sort. Notice has been served that corporations desiring important privileges must secure the same in language so plain that the people can readily understand the nature of the grant conferred. Financiers had attached much importance to a legal opinion of the late Benjamin Harrison that the interpretation placed upon the act by the companies was the correct one; therefore they were not prepared for the decision given by the Supreme Court. This ruling deprives the companies of their most important weapon in their fight with the city, and the prices of traction securities naturally dropped rapidly on the stock The City Railway was not a markets. party to the litigation, but the decision, of course, is applicable to that company. Under the Court's ruling the companies together have only about two hundred miles left, the franchises to which in no case run longer than ten years. This is

a disjointed mileage, mostly for outlying lines. The franchises for about five hundred miles of single-track road have expired or are terminable by city purchase, so that the city now is in an excellent position to dominate the situation. the north division the grants have expired absolutely. In the case of most of the south and west side lines, under the terms of the original ordinances, the companies have the right to operate until the city shall elect to purchase the tangible property at an arbitrated valuation. Naturally, the companies will be allowed to go on operating by sufferance for a considerable time yet, as they have been doing heretofore as to a number of lines the grants for which expired by limitation on July 30, 1903.

The Dalrymple Report on Municipal Ownership

full text of Mr. James Dalrymple's report to Mayor Dunne, of Chicago, on municipal ownership of street railways, made public last week by the Chicago City Council, does not alter the opinion expressed editorially in The

A reading of the

Outlook in the issue for the 24th of June, 1905, which is based on the reports of interviews with Mr. Dalrymple at the time of his visit. What Mr. Dalrymple has to say, both in the original report and in the supplementary notes, concerning the working of municipal ownership and operation in Glasgow is of undoubted value. In telling what this Scottish city has done, and, in particular, in reporting the financial results of its municipal undertaking, Mr. Dalrymple speaks as an expert; but in expressing his views as to the fitness of American municipalities for establishing either municipal ownership or municipal operation of street railways Mr. Dalrymple speaks, not as an expert, but as an observer. As regards the practical results of ownership and operation in Glasgow, Mr. Dalrymple makes it clear that the undertaking is an undoubted success. He also makes it clear that the methods in vogue there are different in detail from those which could in all probability be adopted in

this country. His suggestions for the

organization of a department to operate street railways deserve careful consider-They range all the way from the suggestions for the organization of the executive staff, and devices for insuring the payment of fare, to suggestions on arrangements for the comfort, safety, and insurance of the employees. His suggestion, on the one hand, for the policy which Chicago ought to adopt should be considered with great caution. As is indicated in previous paragraphs, the situation with regard to the franchises of the street railway in that city has just been changed by a court decision. Moreover, Mr. Dalrymple's judgment as to the fitness of American cities for municipal ownership cannot have the weight that his statements as an expert on the Glasgow undertaking necessarily have. It is, besides, noteworthy that Mr. Dalrymple neglects to make any distinction between municipal ownership and municipal operation. Mr. Dalrymple's objections, however they are to be regarded, are directed against municipal operation in American cities, not against municipal ownership. It is to be remembered that the issue in Chicago, as in other cities of the United States, is one not of municipal operation but of municipal ownership.

Governor Pennypacker's Veto of Railway Probing Resolutions Governor Pennypacker, of Pennsylvania, has vetoed both reso-

lutions passed by the recent special session of the Legislature of that Commonwealth directing an inquiry into the affairs and relations to coal-mining of the railroads of that State. The Garner resolution provided for a special commission to inquire into the affairs of the Philadelphia and Reading Railway Company and the Philadelphia and Reading Coal and Iron Company; while the Creasy resolution directed the Attorney-General of Pennsylvania to investigate the relations of the railroads of that State to the coal-mining industry, in view of the constitutional prohibition aiming to prevent railroads from engaging either directly or indirectly in coalmining. The Governor's reason for the veto is to the effect that the subjects

treated in these resolutions were not germane to the objects expressed in his call for the special session. The adoption of the resolutions by the Legislature has served a useful purpose, however, in calling to the attention of the public important facts bearing on the relation of the hard-coal-carrying railroads to the anthracite industry, which are likely to have a reactive effect upon the coming regular session of the Pennsylvania Legis lature and may result in action along this line, unless the investigation now in progress under the direction of the Inter-State Commerce Commission attains the object A general summary of the more important facts dealing with this problem was presented in the Philadelphia " Public Ledger" of March 5. The writer of the "Ledger's" article points out the constitutional provisions in question, and, in clearly explaining the intricate corporate organization of the "Reading system," shows how, in the opinion of that writer, the constitutional enactments of a sovereign State are set at naught in letter as well as in the spirit and intent of the will of the people. One of the most telling and convincing points in this article is summarized as follows: " As President of the Philadelphia and Reading Railway Company, Mr. Baer makes the rates for the transportation over his railroad of the coal mined by the Philadelphia and Reading Coal and Iron Company, of which he is also Presi-As President of the Central Railroad of New Jersey, Mr. Baer makes the rates for the transportation over that railroad of the coal mined by the Lehigh and Wilkesbarre Coal Company, of which he is also President. In other words, Mr. Baer as President of the coal-mining companies receives rates from himself, although under the legal distinction as President of the railroad companies." All four of the above-mentioned companies, as well as more than seventy-five other distinct corporations, are owned by the Reading Company through the possession of a majority and in some cases of all of their capital stock. The "Ledger" article also shows that the Reading system is controlled, through ownership of stock, by the Pennsylvania Railroad which latter also controls the

more important soft-coal-carrying railroads, such as the Baltimore and Ohio, the Chesapeake and Ohio, the Norfolk and Western, and others. In view of the statement of the writer of the "Ledger" article that "through corporate creatures of the State there has grown up a 'system' which not only controls absolutely the present output of hard coal, but has within its grasp almost the entire future supply of anthracite in Pennsylvania, thus permitting a small group of men to levy a tribute upon this and succeeding generations through every ton of coal consumed," The Outlook is of the opinion that the investigation of the Inter-State Commerce Commission into the relation of the railroads to coal-mining is one of the most important public duties ever committed to an investigating body. We hope that the Commission will be able to suggest to the Federal Government some practical way out of the present intolerable situation of corporate taxation of the people without their representation and consent. Important results bearing upon the general situation are expected to flow out of the reopening of the case of William Randolph Hearst vs. the anthracite-carrying railroads, which was postponed about a year ago to await action on issues involved in a suit before the United States Supreme Court, and which case has now been set for a hearing in Washington on March 29.

In the account in The

Outlook of the en-

The Battle with the Moro Outlaws

gagement in the island of Iolo between United States troops and a band of Moro outlaws who were defying the authority both of the Sultan of Jolo and that of the United States, the fact that the Moro loss of about six hundred killed included many women and children was stated without comment for the very good reason that at the time of writing no detailed and satisfactory account of this matter had reached this country. It is perfectly natural that the news of the killing by American soldiers of women and children should be received with profound regret, but the character of the American soldier and the purposes and methods of our Government in the East are such that to condemn unsparingly without knowledge. (as was done by some newspapers and individuals) was on the face of it reckless and unreasonable. We have now General Wood's own account of the matter. sent in response to the cable request of the War Department. General Wood points out that these Moros were not only outlaws against every Government, but were Mohammedan fanatics of the most extreme kind, who believed that death at the hands of the infidel means immediate paradise. They neither gave nor received quarter, but fought to the last extremity in their intrenched stronghold. Even when American nurses and surgeons attempted to aid the wounded Moros, the latter, at the last gasp, tried to kill their rescuers. With this band were a number of women and children. eral Wood's statement as to the death of the women and children is as follows:

I was present throughout practically entire action, and inspected top of crater after action was finished. Am convinced no man, woman, or child was wantonly killed. A considerable number of women and children were killed in the fight—number unknown, for the reason that they were actually in the works when assaulted, and were unavoidably killed in the fierce hand-to-hand fighting which took place in the narrow inclosed spaces. Moro women wore trousers, and were dressed and armed much like the men, and charged with them. The children were in many cases used by the men as shields while charging troops.

These incidents are much to be regretted, but it must be understood that the Moros, one and all, were fighting not only as enemies, but as religious fanatics, believing paradise to be their immediate reward if killed in action with Christians. They apparently desired that none be saved. Some of our men (one a hospital steward) were cut up while giving assistance to wounded Moros, by the wounded and by those feigning death for the purpose of getting this vengeance. I personally ordered assistance given to wounded Moros, and that food and water should be sent them and medical attendance. In addition, friendly Moros were at once directed to proceed to the mountain for this purpose.

General Wood further pointed out that in all former actions against the Moros the latter have been begged again and again "to fight as men and keep women and children out of it," and that in this case it was impossible for men who were fighting for their lives at close quarters to distinguish who would be injured by their fire. In transmitting General Wood's despatch to the President, Secretary Taft declares that it shows most clearly that the unfortunate loss of life of men, women, and children among the Moros wholly unavoidable. President Roosevelt evidently holds the same view, for in replying to Secretary Taft he says that General Wood's answer is entirely satisfactory; and as to the military operation itself, adds that "the officers and enlisted men have performed a most gallant and soldierly feat that places added credit on the American army."

æ

The establishment by the Forestry in Federal Government of forestry reserves has been attended with a well-nigh unanimously favorable feeling on the part of the citizens of the States affected. Here and there, however, as in Minnesota and Idaho, misconceptions and misunderstandings have arisen. In the latter State these have had as their spokesman United States Senator Heyburn, who in the Senate has now formally stated the grounds for his discontent. He claims that vast agricultural and mineral lands have been included in the forest reserves to the detriment of farmers, miners, and prospectors; that the forest service claims discretion as to whether land is more valuable for mineral, agricultural, or forestry purposes (this, we would interpolate, is only until evidence to the contrary is produced); that the Land Department circular prevents prospectors and miners from exercising their rights; that cattlemen have requested the Government to make forest reserves out of land purely for grazing purposes for their personal benefit, and that forest reserves are being created that have no forests in them in order to facilitate grazing and grazing privileges to those fortunate enough to get contracts for them. plying to his colleague, Senator Dubois, of Idaho, declared that not one-tenth of one per cent. of the fourteen million acres now or hereafter to be in forest reserves is agricultural land; that there is nothing to prevent a prospector from going anywhere on a forest reserve, for the Land

Department circular applied to miners and not to prospectors; that no reserve has been created out of grazing grounds for the purpose of privately benefiting cattlemen, but that the Idaho graziers, except perhaps a few large sheep-owners, favor the reserves, because by the system the number of permits is held down so that the range is not destroyed by over-grazing but is preserved from one year to another; that one company alone owns half a million acres of the best white pine timber in the world, nearly all located in northern Idaho, and will cut off the timber, destroying the forests which the people of the State would preserve for themselves and posterity; that in southern Idaho the limit of water supply has been reached, for there is not enough water to irrigate the lands where ditches have been built; that forest reserves are absolutely necessary to conserve the water supply; that the design of the forest reserve is to make it easy for the citizens of its region to get timber, to mine, and to do business on the reserve, thus using and at the same time preserving the forest; and that this policy is especially applicable to a State in which during the past half-century one-third of the forest has been burned, destroying four hundred million dollars' worth of lumber. The people of the whole country are interested with those of Idaho in the matter, for the main spur of the Rocky Mountains passes through the State and forms a watershed with evident importance to all our Western country.

•

A bill is pending in The Joint Eastern Congress, calling for Forest Reserve Bill an appropriation of three million dollars, to establish two reserves in the East-the White Mountain and the Appalachian Reserves. The appropriation is to be expended in the ratio of two for the Southern to one for the Northern. The advantages to be obtained by creating these two reserves have been often stated in The Outlook. The objections raised by some Congressmen, however, are: 1. That the States themselves should take the necessary action. 2. That the policy on the part

of the Federal Government of appropriations to the several States for this purpose opens a well to which there is no bottom. 3. That the Western reservations were set aside from Government lands, but the Eastern reservations would involve appropriations for their purchase. 4. That the condition of the Treasury does not permit this expenditure at pres-5. That the purchase of land by the Federal Government in the several States involves a new policy, and Constitutional questions of States' rights. We would therefore restate the infinitely preponderating advantages. The objecting Congressmen need to realize: 1. That no effective system can be carried out by seven or eight State Legislatures acting independently, nor can the less wealthy agricultural States, having no large cities, afford to set aside large portions of land to protect the waterflow in other States. 2. That in reserving the watersheds in the White Mountains and the Southern Appalachian Mountains, as proposed, together with the Western reserves already established, the headwaters of the leading rivers in the country flowing into other States are covered. These two reservations meet the case as regards waterflow. 3. That setting aside a reservation in the West withdraws the land and timber from sale, and affects the Treasury as directly as an appropriation. The cost falls upon the country, and there is no difference in principle. 4. That the Treasury is in as good condition now as at any time. There is always the cry of insufficient funds. The measure will pass this session if Congressmen feel that the people want it. 5. That the Federal Government holds, not only the National parks and forest reservations in nearly every one of the Western States a policy that is no longer "new"—but also military and other reservations in the East, like those at West Point and Gettysburg. Each of the Eastern States in which the proposed reservations will be located has passed laws enabling the United States to purchase lands for forest purposes within its borders. The general welfare clause of the Constitution was inserted in order to cover such cases, in which action by the separate State Legislatures cannot be effect-

ive. The need for prompt action is very great, as will be seen by a reference to Mr. Ayres's article on "The Forest Primeval" published in this issue. Through the advance in prices every year of delay will cost a million dollars more in money, besides the increasing destruction from floods and erosion and the inexcusable waste of timber. every one to whom this matter appeals (and why should it not be of universal appeal?) write to his Representative and Senators urging that the reservations in the White Mountains and the Southern Appalachian Mountains be established at this session of Congress.

•

The Supreme Court Responsibility for of Kansas has re-Drunkards' Crimes cently announced an interesting decision in an unusual case involving the responsibility of liquorsellers for crimes committed by drunk-The case, which was appealed ards. from the district court of Atchison County, was brought under the provisions of a statute permitting a suit for damages to lie against any person who shall, "by selling, bartering, or giving intoxicating liquors, have caused the intoxication" which resulted in injury to person or property or the loss of means of support. One Sunday in 1900 three men visited a brewery on the outskirts of Atchison and became intoxicated on liquor furnished from it. In a fight that followed one of them killed the other two. He was convicted of murder and was sent to the Kansas penitentiary under sentence of death, which, in accordance with the Kansas custom, means imprisonment for life. His wife brought suit for \$5,000 against the owners of the brewery to reimburse her for the loss of her means of support through her husband's imprisonment. The decision of the district court was in her favor. In upholding the action of the lower court and sustaining the validity of the law the Supreme Court says: "It was known to the Legislature. as it is to all other persons, that the use of intoxicating liquors as a beverage makes drunkards; that an intoxicated person is likely to inflict injury on others at the cost of his liberty, possibly his

life; that he habitually neglects his business and family; that the harm resulting from the excessive use of intoxicating liquors always falls most pitilessly upon the dependents of the user, not infrequently pauperizing himself and family. The idea naturally suggested itself to the Legislature that if the sellers of intoxicants were made liable to those who should sustain injury to person or property or means of support by an intoxicated person, or in consequence of intoxication, the hazard would be so great that fewer persons would engage in the business, and those who would engage in it would exercise more caution. Legislature, therefore, gave a cause of action and created a liability for these injuries where none existed at common law." It will be observed that, although the liquor traffic in Kansas is prohibited by a constitutional provision, the State Legislature nevertheless recognized its existence and sought to impose additional restrictions upon it through the statute just cited.

₩

College Men and City Government

One of the most promising signs of improvement in public life is

the change which seems to be taking place in the political interest of college students. The character of this change is indicated by the organization last week of the Intercollegiate League of Civic The meeting in New York at Clubs. which this League was organized was attended by delegates representing thirteen colleges. Later the college men visited President Roosevelt, and in a conference of two hours had the benefit of his enthusiasm and experience. movement has had the aid of the President from its inception. The clubs themselves are of recent origin. Until lately political clubs in the colleges were of two categories: those which were devoted to some political propaganda, as, for instance, the promotion of tariff reform; and those, necessarily ephemeral, devoted to the support of the Presidential candidates of various parties. Neither class of organizations has any very intimate relation to the college student's real interest; the one was hardly more than a badge which announced its members' more or less immature economic convictions, the other little more than an opportunity for participating in torchlight processions. These newclubs, on the other hand, are formed for the study of municipal government and for the encouragement of participation in municipal affairs. Groups of college men have already lent their influence to movements on behalf of efficient city government; the last Jerome campaign in New York, for instance, was greatly benefited by the college men who gave their serv-Moreover, the study of sociology and kindred subjects in the colleges is equipping college students for practical participation in municipal affairs. The old tendency of college life to be apart from the world, to be in fact a life in a world of itself, is diminishing, and through college settlements and other mediums college undergraduates are more than ever concerned with the world of men in which the colleges are placed. For generations English university life has been a preparation for participation in English public life, and as Parliamentary government in England penetrates the common life of the people very much more than the legislative forms of government in this country, the political experiments of English undergraduates have been in Parliamentary form. In the United States the situation is different. Here democracy seems to find its most obstinate difficulties in the cities; and yet it is the city government or other forms of local government which affect most intimately the life of the American people. This, therefore, is a most wholesome and promising movement that is taking place in the colleges. It is not unreasonable to hope that by means of it men of intellectual equipment and wide interests, such as college men ought to be, will soon be rendering to municipal democracy in America a service similar in proportion to that which they have rendered in the history of Parliamentary government in England.

Susan B Anthony
The death of Miss Susan B. Anthony, at her home in Rochester on Tuesday of last week, ended a career of extraordinary length and sustained energy. Born in

Adams, Massachusetts, in 1820, of a Quaker family, Miss Anthony began her "schooling" in a little district school in Washington County, New York. Her inability to learn "long division" led her father to set apart a room over his store for a private school, employ his own teachers, and select the pupils. this school Miss Anthony continued until she was fifteen years old, when she herself began teaching, at a salary of \$1.50 a week and her board. She was at that time a Puritan of the Puritans, and in a letter to a friend expressed her indignation that President Van Buren should attend two theaters in New York, "encouraging one of the most heinous crimes or practices with which our country is disgracing herself, and afterward we find him rioting at the wine-table the whole livelong night." The crudity of judgment of early youth and the lack of perspective which prompted some of Miss Anthony's early ethical opinions vielded later to a larger knowledge of men and a broader conception of life. In 1852 she was teaching in Rochester, and had already plunged with heart and soul into the temperance and anti-slavery movements. In 1848 the first Woman's Rights Convention met in Rochester, and Miss Anthony's parents became enthusiastic supporters of the movement. She was in full sympathy with the demand of equal civil rights for women, but not yet convinced of the need of suffrage. On a visit at Seneca Falls in 1852 she made the acquaintance of Mrs. Elizabeth Cady Stanton, who was to be her lifelong friend; later she met Miss Lucy Stone, and her public life dates from that year. In the summer of 1852 she canvassed the State as an advocate of the women's temperance movement, and in the autumn of the same year she attended for the first time the Woman's Rights Convention at Syracuse, and became a convinced advocate of that movement. Her first efforts were in the lines of practical amelioration of the condition of women, and she was largely instrumental in securing the passing of a law through the Legislature of New York providing that married women should be entitled to the wages they earned and to an equal guardian-

ship of their children. During this period she dressed in the "bloomer" fashion, but had the good sense and good taste to discard it later. In 1858 she made a report in a teachers' convention in favor of co-education. She was an earnest anti-slavery speaker in the years before the war, and during its continuance devoted herself chiefly to the Women's Loyal League. In season and out of season, wherever opportunity offered, she agitated in favor of woman's suffrage, and proposed bills and amendments and presented petitions to various legislatures. A small fortune which she received in 1882 was largely spent in the publication of a "History of Woman Suffrage" in four immense volumes, which she placed without charge in twelve hundred public libraries and presented in great numbers to colleges, schools, and influential persons. publication of these books involved not only a great expenditure of money, but an immense amount of labor, to both of which Miss Anthony made unstinted contribution.

9

Miss Anthony has been. Her Personality on the whole, the most prominent leader in the woman's suffrage movement, and has been before the public a full half-century. She has spoken in almost all parts of the United States, and until within a very few months retained her vigor of body, and until the end her vigor of mind. For many years she passed through a constant storm of ridicule and sometimes of abuse; and her angular figure and face lent themselves easily to caricature. She looked the typical woman suffragist of the popular imagination of forty years ago; she was, on the contrary, a woman of a great deal of charm of nature. Vivacious, overflowing with humor, kindly, and singularly unselfish, her hand, her means, and her thought were always at the command of the cause she loved and the people in whom she was interested. Her life was a long devotion; and, whatever may be thought of the cause to which she gave the greater part of it, no one can question its entire consecration, its penetration by the highest ethical impulses, its unfailing courage, and its unshaken faith. As an advocate of an unpopular cause she was indefatigably earnest and persuasive, appealing to reason rather than using gifts of eloquence, in which she was easily surpassed by many of her co-workers. She was quick and adroit in statement and always in command of her intellectual resources. She never seemed to harbor any resentment toward those who heaped ridicule upon her; and she had a delightful way of recalling, with touches of humor, experiences which must have been very disagreeable at the time. She was a born individualist, quite willing to stand alone, and perhaps preferring to do so; but she was the servant of her ideas and the trustee of all her gifts. That she was mistaken in the main contention of her later years The Outlook believes: that she was influential in removing many disabilities from women and opening new fields for their activity is beyond question.

The twenty-fifth anniver-For the Family sary of the National and the Home League for the Protection of the Family is a fit occasion for comment on the effectiveness of judicious, quiet perseverance in a good cause, though for a time inadequately seconded. It gives encouragement to all who see that they must begin in a small way, if they begin at all to do good, and must " learn to labor and to wait" while trying to make things grow. The League has called no mass-meetings. By personal communication, by correspondence, by lectures, reviews, and monographs, it has endeavored to cultivate public opinion, and to inspire a reaction against the evils that menace the family and the home. It now has much to show for Many States have bettered their laws of marriage and divorce. Independent movements have sprung up to second its appeal for uniformity of legislation on these subjects throughout the country. At the call of the Governor of Pennsylvania, commissioners from three-fourths of the States met at Washington last February and agreed upon the terms of a uniform law of divorce. The churches also have responded to the

influence of the League by a movement, embodied in a committee representing fourteen Protestant denominations, to promote unity of attitude toward the marriage of divorced persons. Viewing the Family as the social unit, the League has led the way in pressing upon the church and the school the need of attention to the home as the great factor in social problems. The Home Department of the Sunday-school is of its origination. Such work has given the League international reputation as a source of sound knowledge and judicious counsel. Yet its resources thus far have been pitifully meager, supplying little more than an \$1,800 salary for its Secretary, Dr. S. W. Dike, of Auburndale, Massachusetts, the brain of the whole movement, whose record has won him high rank among American and European sociologists. Its quarter-century anniversary deserves to be marked by an endowment that shall make its continuance secure and its activity wider.

The Carnegie Institution The Carnegie is a university in which Institution there are no students and in which all the faculties are investigators. From its Year-Book of 1905, just published, an idea may be gained of the wide scope and great prospective value of the researches which are being conducted in this university of scientific workers. Its grants have been divided into three classes, in aid, first, of larger projects, requiring continuous work, under the direct charge of the Institutionten such are now well under way; secondly, smaller projects, for which thus far some three hundred grants have been made to individual experts; and, thirdly, tentative investigations, a limited number of which have been allowed in the hope of developing exceptional abilities in some investigators. Last year it published twenty volumes of reports of The present policy of the Institution is to provide for large and continuous investigations, which might not otherwise be carried out, rather than to give a great number of individual grants. The reports for the last year show that the work undertaken is of wide range

and along many different lines of scientific promise. It also shows how the purely scientific and theoretical line of investigation runs parallel with the line of utility, and that at almost any moment points of contact may be made between them. Among the larger projects we notice the work planned for the study of plants which are fitted to live in the deserts, together with the aid to be given for five years in furtherance of Mr. Luther Burbank's already fruitful experiments in horticulture. The practical value to be expected from these plans may be judged by the statement in Mr. Burbank's report that already some large groups of cacti have been developed which "produce enormous quantities of nutritious food for all kinds of stock and poultry;" and a great number of new varieties of plants are under cultivation, such as 10,000 new apples, 1,000 new grape-vines, and 10,000 new hybrid seedling potatoes. Researches also relating to the formation and constituents of rocks and metals promise valuable returns. Special interest attaches to the new studies concerning nutrition, to the aid of which this Institution is now contributing, and which are of important psychological value, affecting as they do the economic problem of the support of the population, and also having personal relation to the working power and health of the individual. The Institution is also conducting special inquiries in economics and sociology. Of more immediate theoretical interest is the work initiated in the biological laboratories which the Institution has established, and in its provis ions for studies in physics, as well as in its solar observatory at Mount Wilson, California. It has also equipped a vessel for observations in the North Pacific Ocean on terrestrial magnetism—the beginning of a plan of importance for a magnetic survey of the whole world. Some of the studies which are thus being promoted in different but closely related fields will push further back the boundaries of human knowledge, and will enable us to understand better the factors and laws of evolution and to peer still further into the wonderful mysteries of the beginnings and elements of things.

In providing for this great amount of original research in these and other departments of investigation, the Carnegie Institution, under the broad and farsighted plans of its trustees, already is proving itself to be a great benefaction, not only to science, but to progress in the mastery of nature for man's welfare.

The Pan-American and Hague Conferences

The third Pan-American Congress is to con-

vene next July at Rio de Janeiro, the Brazilian capital. The various committees, composed of diplomats to this country from the different Governments of the Americas, and our own representatives, have about completed the programme and rules for the conference. The list of delegates from this country to Rio has lately been announced. The head of the delegation will be the Hon. William I. Buchanan, formerly Minister to Argentina, and our first Minister to Panama. Mr. Buchanan was Director-General of the Pan-American Exposition at Buffalo, and was also one of the delegates to the second Pan-American Congress (held four years ago in the City of Mexico). He represents much ability and experience in dealing directly with the Spanish and Portuguese nations of South and Central America. The other members of the delegation are President Edmund J. James, of the University of Illinois—formerly Professor of Politics at the University of Pennsylvania, Professor of Public Administration at the University of Chicago, and President of Northwestern University; Dr. Leo S. Rowe, present Professor of Politics at the University of Pennsylvania; James S. Harlan, at one time Attorney-General of Porto Rico; and Señor Larrinaga, resident Commissioner in Congress from Porto Rico to the United States, formerly chief engineer of provincial works, and a member of the Porto Rican House of Delegates. a personnel should be able to do much at Rio in strengthening and cementing the ties between our own and the other Governments south of us. The secretary of the delegation is to be Charles Ray Dean, at present Chief of the Bureau

of Appointments in the State Department. Mr. Dean was secretary to the American counsel in the Venezuela preferential treatment case before the Hague Tribunal. To the forthcoming Conference at The Hague the American delegates are to be Messrs. Choate and Porter, American Ambassadors to London and Paris, respectively; Judge Rose, of Little Rock, Arkansas; Brigadier-General George B. Davis, Judge-Advocate-General of the Army; and Captain Charles S. Sperry, President of the Naval War College.

In 1873 the American Gov-Porto Rican ernment took off the import Coffee tax from coffee. Much of the coffee consumed here comes from Brazil; only a very little from Porto The inhabitants of that island would gladly increase their export of this product. When they hear that their coffee is not as good as the Brazilian, they reply that we do not understand how to grind and roast theirs; that if we did so, we would like it as well. Porto Ricans have largely lost their once thriving European coffee trade because, as they say, they are now subservient to American laws, and, consequently, the American Government should counterbalance this loss by restoring their trade. It is impossible to substitute sugar-cane planting for coffee; the latter is necessarily the island's chief staple and the natural foundation for its prosperity, for it is produced in the mountainous country (where cane cannot be cultivated), and is the main crop of the many small farmers of the interior, as it requires no costly machinery for preparation. soon as it is picked it can be sold green in the berry to neighbors having some kind of machinery more or less perfect. The restoration of the coffee trade can be brought about, declares Señor Larrinaga, the Porto Rican delegate in Congress, by a measure which would also develop coffee production in our Hawaiian and Philippine possessions, where like climatic, agricultural, and industrial conditions exist. The force which, he says, would do all this is, as may be suspected, a negative one—namely, the reimposition of an import duty on Brazilian or other

foreign coffees. This may or may not be a wise course. Like most tariff protection, it would be taxation of the many for the benefit of the few. But if we as a Nation are to continue to be protectionists, here is a chance to be logically consistent and at the same time to offer commercial preference to our insular possessions. Politically, too, the more or less justified grumblings from the Porto Ricans (as to their lack of settled conditions in general and in particular as to the Upper House of their Legislature) would, we think, be considerably lessened by greater attention paid by Congress, under any circumstances, to the island's industrial and commercial problems.

Not even the José María de Pereda modern French school of romancers and essayists is more interesting than is the present Spanish school. Of the latter one of the foremost representatives has lately passed away, at the age of seventy-five—José María de Pereda. He died in his beloved Santander, the city and country which he had immortalized in "La Abeja Montañesa " and in his " Escenas Montañesas," published four decades agothey were forerunners of the best of Flaubert's and Zola's work. A mountaineer by birth and environment. Pereda's profession was at first that of a civil engineer; in politics he was a Carlist and in religion an ultramontane. As a novelist he has been reproached with picturing local types too exclusively, but his critics lose sight of the fact that, while the Pereds types may be individually local, they are universal as types of a broad human nature, essentially the same the world As a stylist he combined in literature something of what has been done in painting by the naturalism of a Teniers together with the more nervous virility of a Sargent. Among Pereda's best-known novels are "Sotileza," "El Buey Suelto," "Los Hombres de pró," and its continuation in "Don Gonzalo;" finally, probably the ripest fruit of his genius, "Pedro Sánchez." All are books of realistic fidelity in the portrayal of his countrymen and women by one who had equal love for them and appreciation of them. In him there was always here a touch of Balzac, there of Dickens, but ever the individual impress of one of the most original interpreters of North Spanish life whom literature has yet known.

A Lenten Meditation

And when he had overcome the temptation to feed himself in a moment of need. instead of making ready, by the dedication of his power, to break bread for the world, the Christ found himself face to face with another of those suggestions which test men like fire: "Thou hast power above that of thy fellows: use it for its own sake; cast thyself down, that angels may appear and bear thee up so that nothing can harm thee." In the vast loneliness the solitary figure was guarded by invisible protectors waiting to do his bidding; the mysterious world of hidden forces was at his command: he had but to speak and heaven would be ringed with servitors, and the unseen rivers of power, pouring silently through the veins of the earth, would sweep toward him to do his bidding. intoxication of that moment no man has ever entered: for while many have striven in later years to do those works of wonder which are called miracles, their achievements, by their own report, have been but faint and far imitations of those mighty works which followed fast upon his way through life and burst into a sudden splendor when the darkness of the grave engulfed him. That mysterious knowledge or command of the secret things of nature which men and women have eagerly sought after was suddenly his possession without thought or effort or putting forth of will. The child born in the manger knew himself king; without visible crown or scepter, far from the pomp of enthronement, he was clothed with a power of which the imperial authority of Cæsar was but a faint and shadowy symbol.

Inthat moment of incredible revelation, when the forces of the world were thrust into his hand, came the impulse to use them for his own pleasure, to play with them in the wilderness that he might please himself with the sense of his divinity.

The temptation which the Christ put aside in that hour of deep and clear vision came again and again to his chosen disciples and to the multitudes that thronged about him, and they fell easy victims to the illusion which he pierced. Children that they were in knowledge of the things of the spirit, they craved the manifestation of his command over material things, the signs and wonders upon which the lesser teachers often lean for authority, the mere magic which delights the curious and bewilders the ignorant and lies wholly outside the realm of spiritual influence. Others have sought eagerly, by meditation, seclusion, fasting, and prayer, for this power to astonish, confuse, and overpower the multitude; the Christ turned away from it in the hour when he became aware of its possession, and shunned the use of it when crowds clamored for its display. The miraculous vitality flowed from him as an effluence of his sinless life; he healed as he passed by, almost without the consciousness that virtue had gone out of him.

The power to do the works which men call miracles will never come to those who seek it or are eager to use it; it can come only to those who have been so purified in the fire of temptation that they are indifferent to every form of influence save the highest, and turn with horror from the curiosity, whether vulgar or ignorant, which craves a sign instead of a truth, and the power to astonish rather than the power to lift and purify. It is not by taking thought, by seeking knowledge, by occult processes in the hands of a few, that men may again work miracles; but by such purity, nobility, unselfishness, and consecration that the love of admiration, the thirst for applause, the care for the awe of those who are bewildered but not regenerated, has been burned out of the nature as by fire. To wish to work miracles is to be unable to work them; to cease to think about them in passionate pursuit of spiritual perfection would be the first step toward the power, by pure effluence of vitality, to open blind eyes, unstop deaf ears, and call the dead back from the graves in which they sleep.

The Christ not only put the tempta-

tion to use this wonderful power for his pleasure behind him, but he lived so constantly in the presence of his Father that he saw on all sides the divine in the human. No rags hid from his eyes the divinity of the men and women who crossed his path. He pierced all disguises, and saw that they were children who had lost their way and were wandering from the Father's house, but were still within reach of his voice, within the circle of his love. To raise the dead was a wonderful manifestation of his authority; but to see the soul of good in the woman who had defiled herself, the power of resurrection into holiness of the man who had buried himself in sins and iniquities, was a wonder the beauty and heavenly fragrance of which had never come within the dreams of men before his voice was heard, saying not only, "Arise, take up thy bed and walk," but, "Thy sins be forgiven thee."

The Situation in China

American relations with China are not yet understood, nor is their importance appreciated, by the great mass of Americans. Many other questions are now uppermost in the public mind which are of far less moment than the feeling of China towards Americans and the future relations of that empire to this country. The situation is still confused, for the empire is vast, has little organic unity, and only a rudimentary race feeling which has been violently disturbed by the events of the last five years, and is coming out of a long sleep with much agitation and many conflicting ideas. Readers of The Outlook will not overlook Dr. Arthur Smith's important contribution on another page; to which a few statements may be added with some confidence.

The present agitation against foreigners is not directed at the missionaries—certainly not at the American and English missionaries. While, in local outbreaks and as the result here and there of local enmity, missionaries may be attacked, and, in the event of any outbreak of violence against foreigners as foreigners which should take on large

dimensions, missionaries would undoubtedly suffer, there is no widespread antagonism to the missionary. On the contrary, there is a growing appreciation of his disinterestedness, capacity, and service. The Chinese are not a dull people. Even the lowest classes, in spite of traditional distrust of and animosity toward foreigners, know when they are treated not only with courtesy but with continued and practical kindness. There have been, it is true, missionaries who have lacked intelligence and tact; for missionaries are quite as human as their critics, though, as a rule, far more dispassionate in their judgments. But the great mass of missionaries in China, representing all Christian bodies, have been devoted, courageous, and effective servants of the Chinese people, eager not only to give them spiritual truth, but to touch their physical and social conditions with a beneficent and healing hand. The Chinese know this. One large city in the Yangtse valley was recently placarded overnight with urgent appeals to boycott all American goods, but with an equally urgent appeal not to interfere in any way with the work of the mission-

There is undoubtedly a widespread feeling of discontent with the Manchu dynasty. Nothing shows more strikingly the essential conservatism of the Chinese and their marvelous power of standing still than the fact that, after four centuries of rule, the present dynasty is still a foreign government, surrounded by the suspicion with which foreigners are traditionally regarded in the Empire, unable to evoke the national sentiment or to draw to itself the strength of racial feeling.

For all practical purposes the present rulers of China are as much foreigners as were the autocratic Russian rulers of Finland. There has rarely been a long period of time which has been free from anti-dynastic outbreaks in some part of the Empire, and beyond doubt the anti-dynastic feeling is wide-spread and enters largely into the agitations of the hour. Whether it is sufficiently definite and cohesive to take on the proportions and the seriousness of a general revolt remains to be seen.

A much more important element in the present situation, however, is the profound stirring of the whole East by the brilliant success of Japan in the war with Russia. It has seemed to the East for many decades as if the West were irresistible. Suddenly an Oriental power stepped into the arena fully armed, used the very latest results of discipline and science with superb effectiveness, struck terrible blows at the Great Power which, more than any other, overshadowed Asia, and has broken the spell which the fear of Russia had laid upon the whole East. News penetrates the Chinese Empire very slowly, but such an event as this has gone to the remotest hamlets, and the humblest Chinese understand what it means. It means, among other things, an entire reversal of the long-existing relations between the East and the West; that the East is to be no longer a foraging-ground of aggressive Western countries; that it is to be no longer the paradise of the concession hunter and the speculator in search of an ignorant and unsuspecting people possessing great natural resources; that its affairs are to be no longer settled around the council boards of Western Powers without so much as a thought of what the Chinese themselves may wish or purpose. The old days are gone. The Yellow Peril, if it be a peril, is here. China is in arms, not against the Western world, but against the short-sighted, narrow-minded, and selfish policy which has dominated most of the Western Powers ever since the Empire was opened to trade.

No Power has asked of itself what it could give to China; every Power, except the United States, has asked itself what it could get out of China. The Chinese propose now to own their own country; to control, if they do not develop, their own resources; to manage their own affairs. There will be no more concessions, no more one-sided bargains, no more surrender of great resources to men who hold the whip-hand both of knowledge and of power. This is the meaning of the present movement in China. It will cost the West something; but if the West recognizes what it means, and reverses its policy, the yellow peril

will become, as some one has wisely said, the yellow opportunity.

This country has made its special contribution to the Chinese situation by an almost incredibly short-sighted treatment of the Chinese. The anti-race feeling which found expression years ago on the sand-lots of San Francisco promises now to limit the development of the Pacific coast at the very hour when the gates of the East are thrown wide open for the first time. We have treated the Chinese not only with brutality, but with a stupidity which is incredible. They do not object to a certain kind of exclusion, to the drawing of the lines against certain classes of the population, or to the importation of laborers under certain conditions. If these lines of exclusion had been drawn intelligently, consistently, and with decent regard for Chinese feeling, there would have been no trouble. The Chinese are a commercial people, but their word for business involves not only the idea of traffic but of courtesy. They are extremely sensitive in the matter of personal dignity. We have treated them to every form of indignity. We have stripped them naked, photographed them as if they were criminals, put them in the hands of stupid inspectors who have acted like men of a superior race dealing with inferiors, and have not known that their own lack of civilization was thrown into the most striking relief by the much more highly civilized men with whom they were dealing. In a word, we have done everything we could in dealing with a very considerable number of influential Chinese to insult and outrage Chinese feeling, and to awaken against ourselves a national indignation. What is called the reaction in China is not fundamentally commercial; it is sentimental, and we are reaping the harvest of the seed sown by short-sighted and stupid blindness during the past decades. These facts cannot be too widely known in this country. It was our great good fortune, in a critical hour in the history of China, to have a Secretary of State large enough to recognize the opportunity for making friends with a great people. If the spirit in which Secretary Hay dealt with China during the Boxer troubles had pervaded our treatment of

the Chinese for the past thirty years, we should have bound the Empire to us with bands of steel. As it is, we have done everything in our power to alienate it, and we are now facing the loss of a great market and the friendship of a people just coming into national consciousness with possibilities of influence, power, and wealth which no Western man can adequately measure. The policy which ought now to be adopted The Outlook will outline in its next issue.

Corporations and the Supreme Court

In the issue between the people and the corporations there are two distinct questions: (1) What are the limits of the powers which have been granted by the people to the corporations? and (2) What is the best way for the people to exercise their control over the corporations which they have created?

The former question is one to be answered by the courts; the latter is one to be answered by the people through legislative enactment. In the nature of the case a court cannot answer the latter question as to the best way of controlling corporations, nor a legislative body the former as to the present powers of corporations. This distinction must be kept in mind if the general problem of governmental control of corporations is not to be obscured.

The four decisions handed down last week by the Supreme Court in the cases) of the so-called tobacco and paper trusts (have to do, therefore, with only the former of these questions. In that respect the decisions are limited in effect. an answer to that one question-What are the present powers of corporations? they are of far-reaching effect. In brief, these decisions establish the principle that, whether in action in court, investigations by a grand jury, or proceedings before an examiner, a corporation has no right to hide behind the personal immunity of its officers from self-incrimination.

The case in which the fundamental principle was established was that result

ing from an action between the United States and the American Tobacco Company and the MacAndrews & Forbes Company. The Secretary of the lastnamed Company, subpænaed to appear before the Grand Jury, declined to testify on two grounds; first, that there was no specific "charge" pending, and, second, that his answers might tend to incriminate him; and he declined to produce certain papers demanded, on three grounds, the third being that they might tend to incriminate him. The Court decided that there need be no specific charge before the Grand Jury. All that was necessary was that it be "made to appear to the Grand Jury that there is reason to believe that a crime has been committed." As to self-incrimination, the Court held that the witness was protected by the act which provides that no one shall be prosecuted on account of anything concerning which he may testify or produce evidence. The defense insisted, however, that "while the immunity statute may protect individual witnesses it would not protect the corporation" of which the witness was a representative: The Court answers that "it was not designed to do so." A witness, it says, "cannot set up the privilege of a corporation." The heart of the decision is in these words: "The individual may stand upon his constitutional rights as a citizen. He is entitled to carry on his private business in his own way. . . . Among his rights are a refusal to incriminate himself, and the immunity of himself and his property from arrest or seizure except under a warrant of the law. . . . Upon the other hand, the corporation is a creature of the State. It is presumed to be incorporated for the benefit of the public. . . . Its rights to act as a corporation are only preserved to it so long as it obeys the laws of its creation. There is a reserved right in the Legislature to investigate its contracts and to find out whether it has exceeded its powers. . . . The defense amounts to this: That an officer of a corporation, which is charged with a criminal violation of the statute, may plead the criminality of such corporation as a refusal to produce its books. To state this proposition is to answer it. While an

individual may lawfully refuse to answer incriminating questions unless protected by an immunity statute, it does not follow that a corporation, vested with special privileges and franchises, may refuse to show its hand when charged with an abuse of such privileges." The Court adds that though in this case the franchise was the creation of one of the States, "such franchises, so far as they involve questions of inter-State commerce, must also be exercised in subordination to the power of Congress to regulate such commerce, and in respect to this the General Government may also assert a sovereign authority to ascertain whether such franchises have been exercised in a lawful manner, with due regard to its own laws. . . . The powers of the General Government in this particular, in vindication of its own laws, are the same as if the corporation had been created by an act of Congress."

The other cases are important simply because in one instance this principle could be applied without qualification, and in the other two instances was applied to cases before a special examiner.

In regard to this decision there are three points it would be well to remember:

I. The decision does not settle the question of publicity for corporations. Those who have hailed it as a complete answer for the popular demand for publicity have either misread the decision or have sadly mistaken the nature of that demand. The Supreme Court makes clear that the law as it stands does not open the books of all corporations to public view; it simply enables the Government to inspect those books when there is reasonable ground for suspecting something amiss. Throughout the decision a definite object to discover an offense is presupposed in justifying inquiry. The Court specifically says: "It is not intended to intimate, however, that it [the General Government] has a general visitatorial power over State corporations." In other words, the decision does not answer the question, How may the people best exercise control over corporations? It has now been established that publicity may be obtained in special cases by special probing; but it is not established that corporations shall normally be open to public inspection, as are now National and State banks.

II. The Supreme Court has in this decision reaffirmed, though in a new direction, the power of the Federal Government over corporations. The Department of Justice may, for example, find that this power may now be applicable in the investigation of the Beef Trust in Chicago. As in the Northern Securities case, and again recently in the case of the Chesapeake and Ohio Railway, the Supreme Court declares that the Government is more powerful than its creatures.)

III. This decision ought to, and we believe will, allay that suspicion of the courts which arises from the feeling that judges are more concerned with the protection of property rights and privileges than of popular rights and powers. It is not inconceivable that the agitation for the control of corporations has had perceptible effect in this and other recent decisions, and that there is here evidence of responsiveness on the part of the Supreme Court to the present tendencies of popular government. At any rate, this decision is rendered, not on the ground of legal tradition, but of human equity, and as such is highly significant.

Wilhelm Gericke

The announcement that Mr. Wilhelm Gericke has resigned his post as conductor of the Boston Symphony Orchestra, and will return in May to Austria to make his home again in Vienna, has been received with universal regret by lovers of music in this country—and that means by a very large body of men and women, for the love of good music and the appreciation of genuine musicians has grown almost by leaps and bounds since Mr. Gericke first came to these shores in 1880, a quarter of a century The cause of orchestral music has been helped forward in America by Mr. Gericke perhaps more than by any other one man, with the possible exception of Theodore Thomas. In saying this we do not forget Karl Bergmann, Dr. Leopold Damrosch, or Anton Seidl, to all of whom New York must be ever grateful for the work which they did in developing and cultivating the musical taste of this community. But Mr. Gericke not only possesses the genius, temperament, and training of a great conductor, but has had the advantage of having a perfectly equipped orchestra put into his hands, with full control to give it the impress of his own artistic mold, and yet has been relieved of the financial at a commercial burdens which so often distract, harass, and obstruct great musicians in their work.

Those who have attended the concerts of the Boston Symphony Orchestra during the last twenty-five years are more or less conversant with Mr. Gericke's history, so far as it is connected with this country. He came to Boston in 1884, when he was thirty-nine years of age, at the invitation of Major Higginson, the founder and generous supporter of the Boston Orchestra. After five years' work he returned to Europe, but again took up the baton in Boston in 1898, and has since remained there.

The Outlook has little sympathy with those who declare that art should be pursued solely for art's sake, that it is to be judged merely by standards of sensuous beauty, that its purpose is solely to give pleasure to the eye, ear, or the mind, that it consists exclusively of color and form in painting, of tone in music, and of style in literature. Of course beauty is the prime and fundamental element in art, but too many artists forget that line in Keats's immortal "Ode on a Grecian Urn" which tells us that beauty is truth, truth beauty. It is this element of truth or character in art that makes it something more than a mere pastime and source of pleasure. The truest art is an educating, civilizing, spiritualizing force, as well as a vehicle of the supremest beauty. The greatest and most perfectly rounded artists as long as art has existed have recognized this, and an artist is to be judged great by the success and balance with which he mingles these two elements. Judged in this way, Mr. Gericke seems to us to be a great artist. His modesty, his freedom from personal vanity and uncharitableness, his sanity

and wholesomeness of taste, his very wide range of musical knowledge, his capacity to understand, deeply enjoy, and sympathetically interpret all kinds of musica Bach fugue, a Beethoven symphony, a Brahms concerto, a Strauss waltz, or a Debussy tone-poem—are manifestations of that personality and character which, after all, is the source of his power. Mr. Gericke himself, at a supper given in his honor after his farewell evening concert in New York last week, gave expression to this view of the artist's moral respon-At the close of two hours of delightful and friendly companionship and merrymaking, he said his words of good-by to the men who had met to do him honor, by telling the following story: "Many years ago in Vienna I heard Heinrich Esser conduct Flotow's opera 'Stradella.' I had at that time the contempt of the young men of my school for this particular school of Italian music. As the opera proceeded I found to my astonishment that Esser was giving the score the same careful interpretation that he would give to one of the great works of music. After the opera was over I met him and expressed my astonishment and asked him to explain how he could treat so trivial a work with so much respect. I have never forgotten his reply: 'My friend,' he said, 'whatever I have to do I try to do with honesty and sincerity.' This," continued Mr. Gericke, "made a deep impression upon me, and I have ever since endeavored to make it my rule of conduct in my professional life."

It is perhaps too soon to form a perfectly just estimate of Mr. Gericke's genius in that field of art in which he has worked, but it is not too soon to express feelings of gratitude and appreciation to him for the sincerity, faithfulness, high purpose, and catholicity of spirit and taste with which he has served this country while he has been one of her adopted—unfortunately temporarily adopted—citizens. This is also a suitable occasion for saying a word in defense of the belief that the highest art and the highest morality have something in common—especially when this belief is so well exemplified in the personality and achievements of one of the great orchestral conductors of modern times.

The Spectator

There is no "trust evil" on the lower East Side in New York. The orthodox Jews who inhabit the quarter are a highly individualized people even in their business relations, and combinations of capital are foreign to their natures. Each man creates and conducts his business alone and fails or succeeds by his own The Spectator has unaided efforts. learned, however, that there is one corporation. It is allowed to exist and even to flourish, because it handles a commodity that the Jewish people cannot get along without. It is called the National Hebrew Publication Society, and, through a chain of some fifty book-stores. it supplies the Jews of the East Side of New York with the Hebrew and Yiddish literature which appears to be an absolute necessity of their daily lives.

☻

The Spectator has investigated and can say positively that there is not another district of the same restricted area in the whole of Greater New York that supports so many book-stores as the so-called "slum" of the lower East Side. Despite their number and despite the fact that they are all tacitly understood to be in the trust, every one of them is doing an excellent business. The people of the neighborhood are poor, but they are not so poor that they cannot always spare a little for a good book. They have a natural and instinctive hatred of trusts, but they will put up with a trust if they must in order to satisfy their hunger for reading. The four largest of these book-stores are strung along Canal Street from the Bowery east to Allen Street. From the outside they look like shops for the sale of the ritualistic accessories of the Jewish religion. The windows are filled with prayershawls, embossed white and colored pasteboard models of the tabernacle and the scrolls of the Law. brass candlesticks, silver wands tipped with filigree balls hung about with tiny gold bells, phylacteries and the black silk skull-caps worn by the men and boys in the synagogue. The only hint of the real nature of the business is a large and varied

assortment of prayer-books in Hebrew and Yiddish. This is due to the fact that, up to thirty years ago, there was no general Yiddish literature. Except for the scholars who knew Hebrew, the Jews read only their prayer-books. In those days, therefore, the Jewish book-store was practically a ritualistic institution, and its stock consisted solely of ritualistic goods. To-day the ritualistic goods are chiefly in the window, where the exterior marks of piety are strictly maintained, and the inside of the shop is filled with secular literature.

•

The opening of the door usually reveals a long, narrow room, musty with the smell of books and soup and dimly lighted with flickering gas, lined with shelf on shelf of books reaching from the floor to the ceiling and retreating into the shadowy recesses in the rear. There are usually from six to a dozen men—all wearing hats and most of them wearing beards—standing about groups discussing, with every appearance of great excitement, philosophy, history, religion, or literature; or rambling about by ones and twos, glancing over titles and occasionally taking a book down from the shelves to read a passage or to clinch an argument. As you enter and engage in conversation with the proprietor, every man in the shop will instantly abandon whatever is holding his attention at the moment, and. without removing his hat, will step briskly forward and settle himself to listen frankly and with undisguised interest to the colloquy. If he finds that he has anything to say, he will break in with it without hesitation or embarrassment. This is no more due to bad manners than the wearing of the hat-a ritualistic survival—but to the most striking of all East Side characteristics, that where a discussion is the issue, all else is forgotten.

(2)

The other day the Spectator strolled into a Canal Street book-store to ask some questions in regard to the literature that is most read on the East Side. The proprietor was of that Biblical type of

Iew—so rare nowadays as to be almost extinct. He was tall and powerfully built, with a vivid, dark skin, black eyes, and black, crisply curling hair and beard sprinkled with gray. In a red and white striped mantle instead of his somewhat greasy black frock coat, he would have looked as if he had just stepped out of a book of Bible stories or a stained-glass window. He heard the Spectator through with quiet politeness and then informed him that he "had no Anglish." Spectator "had no Yiddish," he was about to depart, when half a dozen men who had miraculously gathered during the brief dialogue volunteered in chorus to give the Spectator the information he wanted.

Immediately the proprietor's private desk was unceremoniously rummaged for his catalogue, his books were reached down from his shelves, and he himself was hustled aside and effectually silenced with the magic words, "For der Anglishe paper." A young man of the politically assimilated but religiously orthodox type spread the Yiddish catalogue out on the desk, and, reading from right to left, began telling off the names of the authors whom he considered most popular among the Jews. Abramowitz, he said, was the most popular Yiddish author-S. J. Abramowitz. He was nicknamed "the Bookseller of Odessa." He lived in Russia and wrote satirical novels. there was Bomfeld. He was greatly read-

"That is wrong," flatly broke in another voice. "Bomfeld is not read on the East Side. Perhaps you are a 'book-Well, I will tell you that, seller' too. whether you are or not, you know nothing of books. Bomfeld is a technical writer. Every one knows that he is only read by scholars." The Spectator turned and looked at the speaker. He was a young man of the class on the East Side known as "intellectuals," and oftenest seen at Socialist and Anarchist meetings. He had a high, broad forehead, with the spiritual look as well as the material build of intellectuality, the introspective eye of the learned Jew, a celluloid collar and a dirty white necktie. The youth whose literary information he had impeached betrayed no sign of annoyance, but aggressively defended his statement that Bomfeld was read on the East Side, until, beaten to earth by recurring and more violent attacks from the intellectual in the dirty necktie, he agreed to strike Bomfeld from the list. "We have, then," he went on, again referring to the catalogue, "Jacob Dineson—"

®

The unwashed intellectual broke in again with a snort of derision.

"Do you know anything about literature?" he asked scornfully, snatching the catalogue from his adversary's hand. "Do you give authors as their namescome in the alphabet? Do you not know that Peretz is most read on the East Side— Peretz and Schalom Aleichem?"

"No," cried the other young man vehemently, reaching for the catalogue again. "Abramowitz! Those who know anything never leave out Abramowitz."

"Sure, Abramowitz is the one—he is right—everybody reads Abramowitz," burst in chorus from the surrounding group, who, with heads bent forward and hands in pockets, were giving the argument a strained attention.

"Abramowitz? Well, yes," grudgingly assented the unwashed intellectual, giving the champion of Bomfeld and Abramowitz a contemptuous look. "Abramowitz is read. Peretz, the realistic novelist; Schalom Aleichem, the humorist, and Abramowitz—they are the favorites."

"There is Fruz," broke in a voice.

"Yes. Fruz, the nationalist poet. He is read," admitted the self-constituted arbiter.

"And Ahad-ha-Ane," cried another voice.

"Sure," broke in another. "Ahadha-Ane is read."

"And Gordon," came a voice from the confines of the group.

"All those are good," agreed the arbiter. "Ahad-an-Ane, the great modern Hebrew writer whose real name is Gins-

berg, and Gordon, the Jewish Voltaire. They are both popular."

e n writer

"And our own writers here in New York—" began the vanquished champion of Bomfeld, boldly.

"Wait a while," commanded the arbiter, silencing the champion of Bomfeld with a look. "I will give them." Then, turning to the Spectator, he said grandly:

"We have here in New York some few writers of real distinction. There is Morris Rosenfeld, the poet; Jacob Gordin and David Pinski, the playwrights; Abraham Cahan, the novelist, and Eliakum Zunzer, the folk-lore bard. Mr. Cahan can, however, only be called a Jewish writer because he is a Jew and writes of the Jews. His medium is English."

"And are all these books printed here in the United States, too?" asked the Spectator, with a wave of his hand about the book-lined shelves.

He was answered by a chorus:

"Sure not, no, sir—all importeted—from Russia."

"And there are none but Yiddish and Hebrew writers here?"

Again the chorus spoke.

"Sure there are—all writers there are."
Again the unwashed intellectual silenced the group with his imperative
"Wait a while!"

"In all these Jew book-stores," he said, "they have only the Yiddish and Hebrew languages, but they have translations of the best books in all literatures into Yiddish and Hebrew. Here in this shop you may get in Yiddish Shake-speare, Goethe, Schiller, Tolstoy, Gorki, Voltaire, Victor Hugo, Dante, Swinburne, Shelley, and various other great writers in all languages."

This sounds remarkable to the ear of the novice, but it becomes even more extraordinary when it is remembered that up to thirty years ago the Yiddish—or Jew-Deutsch—was despised as a vulgar dialect even by those who spoke it; and also that the few scattered writers who made use of it as a vehicle for literary expression systematically offered their works with the apology that it was only through the "jargon" that the people

could be reached. As there were, accordingly, very few books in the language of the great mass of the people, and as the comparatively few Hebrew scholars were perfectly content with the gigantic literature embraced in the ancient Hebrew expositions of "the Law," the Jewish people, once known as "the bookish nation," were practically without a living literature. But in the last thirty years the Zionist movement and the awakening in Russia, bringing with it the new progressive movement among the lews and the wholesale emigration to America, has raised a horde of new writers—novelists, poets, playwrights, historians, sociologists, philosophers, and scientists. new literature has sprung into being almost within a generation.

To-day all the Jews who are not writing are reading. With a voracious appetite they devour Yiddish, Hebrew, Russian, German, and English in all forms of their literatures, with the notable exception of popular contemporaneous fiction. On the East Side in New York every soda fountain is a circulating The principal East Side branch library. of the Public Library, located at Chatham Square, numbers a membership of fifteen thousand, and it has been in existence only four years. One thousand books are taken out of this library by Jews every day. It ranks first among all the branches of the city in the circulation of works on history, abstract science, and sociology. It ranks last of all in the circulation of light novels. Besides the fifty strictly Jewish book-stores, there are in the Ghetto three shops where general literature is sold which are wholly supported by the Jewish people. The largest of these, which is located in East Broadway, just across from the Educational Alliance, has the reputation of being the headquarters for the Socialistic and Anarchistic literature of the quarter, but this the owner is at great pains to deny. It is true that you will find there all the radical thinkers from Giordano Bruno down to Jack London; but it is correspondingly true that you will also find everything else that is displayed conspicuously on uptown counters except the "best-selling book of the week."

INDUSTRIAL DEMOCRACY

Are we tending toward the feudalism of capital, the despotism of labor, or a fraternal democracy in industry? Is the admitted industrial unrest in the United States the unrest of rebellious dissatisfaction or the unrest of an aspir-

ing and hopeful ambition?

These and other fundamental questions in regard to the labor problem will receive answer or suggestion of answer in a series of articles which has been planned for The Outlook. This series will comprise two groups, the first dealing with a few important and typical individual industries—selected, not with any view of covering the whole ground, but of presenting the facts about representative industries as a basis for the study of questions involved; the second dealing with specific problems and phases of the labor question. The first article in the first of these two groups is presented herewith. Its author, Dr. Frank Julian Warne, is Fellow in Economic Science in the University of Pennsylvania, is the author of two books dealing with the mining industry, and has written more than one article on this topic for The Outlook. The choice of this particular article to be the first in publication naturally arose from the interest and importance of the coal situation at the present time. While it has seemed best for this reason to present Dr. Warne's article now, the other articles in the series will be reserved for publication in the early fall.

The topics proposed for treatment in this series—subject, however, to some possible changes and additions—are, in the first class above mentioned. The Stock-Yards, The Building Trades, The Transport Agencies, and The Garment Workers, in addition to Dr. Warne's article on The Anthracite Miners. Topics which will be treated in the second class of articles are: Public Opinion in Labor Ranks, What the Union has Done, Restrictions in Labor Unions, The Closed Shop and The Open Shop, The Walking Delegate, Women in Trade Unions, and An Industrial War. Editorial discussion of issues and principles involved and dealing with the trend and meaning of the industrial struggle will appear simultaneously with many of the articles.

Among the writers of the articles in this series we may name: Mr. John Graham Brooks, the author of that extremely suggestive and interesting book, " The Social Unrest," who is recognized as one of the foremost American writers on economic and industrial topics; Professor Graham Taylor, the founder of the Chicago Commons Social Settlement, editor of "Chicago Commons," and Lecturer on Sociology in the University of Chicago; Professor John R. Commons, who occupies the Chair of Political Economy in the University of Wisconsin; Mr. S. B. Donnelly, Secretary of the Building Trades General Arbitration Board; Mr. Ethelbert Stewart, who is in close touch with the views of moderate trade unionists, and will present the argument in favor of the Closed (or exclusively union) Shop, while the argument for the Open Shop will be presented by another writer; Mr. William Hard, a newspaper writer of experience and a special student of industrial conditions, who will be remembered as joint author with Mr. Ernest Poole of a graphic article in The Outlook on the great Stock-Yards strike; Mr. Luke Grant, of the Chicago "Record-Herald," a careful observer of practical labor union evolution; and Mrs. Florence Kelley, well known through her connection with Hull House and the Nurses' Settlement.

HARD-COAL MINERS

MINER AND OPERATOR

A STUDY OF LABOR CONDITIONS IN THE ANTHRACITE COAL FIELDS

BY FRANK JULIAN WARNE

ILLUSTRATED WITH PHOTOGRAPHS BY ARTHUR HEWITT

ITHIN an area in northeastern Pennsylvania of 1,700 square miles, having an actual coal area of only 485 square miles, is confined practically the entire anthracite industry of the United States. This great industry represents a capital investment of \$700,000,000, with natural annual profits of from \$85,000,000 to \$100,000,000, and produces each year about 70,000,000 short tons of hard coal, valued at over \$140,000,000. It furnishes a freight traffic worth \$40,000,000 a year to about eight important railway systems, and pays annually approximately \$70,000,000

in wages to about 155,000 mine employ-

A population of nearly one million people within the anthracite region alone is dependent directly and indirectly upon this industry for their means of livelihood. The two largest cities are Scranton, with a population of 102,000, and Wilkesbarre, with 52,000 inhabitants, both in the northern or Wyoming field. Other important cities, with a population of less than 25,000 each, are Hazleton in the Lehigh field, and Pottsville, Shenandoah, Tamaqua, and Shamokin, in the Schuylkill field. Surrounding

Digitized by Google

these larger cities are numerous small towns and villages, or "patches," as the mining hamlets or groups of buildings in near proximity to a particular mine are called, extending for many miles throughout the valleys and connected

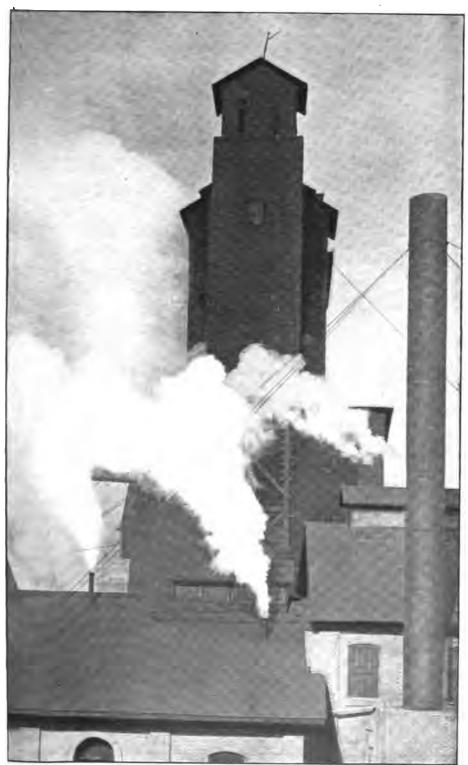

DRILLING A HOLE FOR A BLAST

generally by electric railways. In these cities and towns the occupations and daily callings of many of the inhabitants are not different from the various activities which go to form communal life in other American cities. Some are in the professions, some in the various lines of business, while others are engaged in

different trades identified with the railroads, powder-mills, silk-mills, factories, foundries, and tool and other manufacturing plants. The single dominant group in nearly all these communities, however, consists of the mine workers and their families, and it is their activity that gives the color to communal life. They are conspicuous in the religious, educational, political, and other broad social activities of the three fields, and upon their prosperity rests largely the prosperity of these communities.

These mine workers exceed in number 155,000 men and boys. About 55,000 are engaged in the performance of various tasks outside the mines or above ground, such as superintendents, bookkeepers and clerks, foremen, blacksmiths, carpenters, engineers, firemen, slate-pickers, drivers, watchmen, etc. The tasks of most of these workers are made clear by the designation of their occupations. The foreman or breaker boss looks after that part of the plant above ground, under the direction of the general superintendent, which latter may have supervision over as many as a score of collieries. In not a few cases there is a superintendent for each colliery. foreman oversees the general working of the plant, the distribution of powder and other supplies, the sending of timber into the mine, the coming and going of the cars at the shaft and their arrival and departure at the breaker, and performs other supervising tasks. engineers and firemen care for the machinery that supplies air to the underground workings, or runs the cage or elevator which raises and lowers the cars and men, or pumps the water from the mine, etc. They also have charge of the "lokeys," or yard engines used about the colliery grounds. The slatepickers are at work when the breaker is in operation, assorting slate, bone, and other impurities from the coal as it passes down the screens preparatory to sending it in different sizes to the mar-These latter employees are usually old men and boys.

Among the 100,000 underground workers are foremen or mine bosses, fire bosses, door-boys, drivers, runners, laborers, miners, track-layers, timbermen,

A COAL BREAKER

road-cleaners, car-couplers, stablemen, masons, pumpmen, pipemen, water-bailers, etc. The inside foreman or mine boss, with his assistants, has direction of the entire underground workings, looking after the ventilating apparatus,

Affairs for Pennsylvania, to secure which he must have had at least five years' practical experience as a miner, must have passed an examination by an established board of examiners, and be of "good conduct, capability, and sobri-

A BREAKER BOY

and examining all slopes, shafts, main roads, traveling ways, signaling apparatus, pulleys, and timbering. He also has supervision of the miners, directing them in their work and inspecting their working-places to see that these are safe for the men. The law requires this mine foreman to possess a certificate of qualification from the Secretary of Internal

ety." The fire boss, under the direction of the mine foreman, takes care that the working-places of the miners and all used portions of the underground plant are free from explosive gas, and to guard against this danger the law directs him to make inspections of all used parts of the mine both before the miners begin work and after they leave their places.

He must have had five years' practical experience as a miner. The door-boys, including the fan-boys, guard the heavy wooden doors dividing the gangway, opening and closing them as the cars and men pass in and out. These doors are for the purpose of directing the air currents through the proper openings to the breast where the miners and laborers are at work. In some mines selfacting doors have been provided. Where boys are employed to attend to the doors the law provides that they shall not be under the age of sixteen years, although, as in the case of the breaker boys, the law has not been very rigidly enforced. The drivers employed underground have charge of from one to three or four mules hauling empty and loaded cars from and to the miners' working-places. The stablemen care for the mules in the underground stables. Where mules are not necessary, as in the case of gravity roads in the mine, those in charge of the cars are called runners. Of all the 155,000 outside and inside workers only about 45,000 are miners engaged directly in the mining of coal.

The anthracite mine workers are a part of that vast army of toilers our country over whose daily life is regulated by the blowing of a whistle. Year in and year out, whenever there is work to be done in the mines, the miners, with powder-can, lamp, and dinner-pail, are summoned from their homes at the dawn of day by the first signal of the breaker whistle at six o'clock. Shortly after, they begin to pour out of their houses and swarm over the hills and valleys towards the mines, only to disappear, for the greater part of the day, as suddenly as they came forth. Under the rules of the mining companies no miner is permitted to enter the underground workings after seven o'clock. Before that hour they have been lowered to their workingplaces by means of the elevator-like arrangement in the shaft, or by the cars as they descend the slope. In the greater part of the region the shaft is the most general method adopted for reaching the coal. Where the coal measures are found to "dip" to any extent, as in the Schuylkill field, the slope method is usually employed. Where the stripping method

SURFACE MINING

MAKING A BLASTING CARTRIDGE

of mining is carried on, by which the overlying strata have been removed and the coal measures exposed, the miner does not usually work underground.

The working-place of the miner may be five hundred or one thousand or in cases as many as two thousand feet below the surface, and as far as two or three miles from the main entrance to the mine. While some work with a gang of other miners and laborers in charge of a foreman, as in strippings or in opening a gangway in a thick and wide seam or through solid rock, others are employed mining coal in the chambers or rooms opening from the gangway. These chambers vary in size, depending upon the thickness and width of the seam the miner is working, the seams ranging from two feet to over one hundred feet thick, and extending frequently over large areas. These rooms, called breasts, usually range from twenty to thirty feet wide, generally twenty-four feet, and may have a depth of as many as three hundred feet. In the Schuylkill field two miners as partners or "butties" usually work a chamber together. In this field, and also in the Lehigh field as a general thing, the seams pitch at such an angle as to prevent cars from being run to the working face, and in such cases the coal is worked directly up the pitch. By means of strong timbers across the opening at the bottom the dislodged coal is held in place and gives the miners a support while they mine the solid coal. above them. When the particular deposit has been dislodged, the gate-like arrangement at the bottom is opened and the coal is then run down a chute into the cars, laborers being employed by the company to remove what the miner has mined. In all such cases the two miners, or "butties," work without laborers and are paid so much a yard for the coal they have mined. In the Wyoming field the coal seams are so flat. with few exceptions, that roads can be laid and the mine cars taken to the face of each chamber. This permits the coal to be loaded as it is mined, and in such cases, while the miner dislodges the coal, a laborer employed by him loads it on

When all the coal but what is neces-

sary to support the roof has been dislodged, and a whole section of the mine has been worked out, then the miners remove these supports or pillars, beginning at the inside end and working back towards the shaft as they progress, allowing the roof of the mine, and in cases the surface of the ground, to settle in the excavated places. This is regarded as the most dangerous part of the miners' occupation, and is called "robbing the pillars." Much of the time of the miner underground is spent in drilling holes for his charge of powder which he explodes to dislodge the coal. One discharge may bring down many tons; again it frequently fails completely of its purpose, in which latter case the miner must dig out the coal with his pick and drill. This is called "mining out a shot."

The amount of coal the miner is able to get out depends to a large extent upon the softness or hardness of the seam and the amount of timbering he is compelled to put up. In some cases the character of the coal is such as to allow the miner to take out many yards without putting up any timbers at all, and in other cases he may have to timber every foot of the way for hundreds of yards. In the Wyoming field the seams do not pitch to any great extent, and here the miner is able to wall the refuse alongside his working-place, sending for the greater part only clean coal to the breaker. Where the seams pitch, however, as is the case in the Lehigh and Schuylkill fields, all the coal, slate, rock, etc., dislodged by a charge of powder must be sent out in the cars. To determine the amount of clean or marketable coal in a car, a weighman is employed by the miners to check up the company docking

Generally speaking, the amount of good coal the miner mines determines the wages he receives. To ascertain this three plans are in vogue throughout the region—the car or volume, and the yard or measure systems, which are in use in all three fields, and the ton or weighing plan, which exists only in the Wyoming field. Under these the wages of about ninety per cent. of the miners in the Wyoming and Schuylkill fields, and eighty per cent. of those in the Lehigh

RUNNING A CAR OF COAL INTO THE BREAKER

BRINGING DOWN THE COAL LOOSENED BY A BLAST

field, are determined. The rest of the miners and most of the other employees are paid day wages. As to the wages received by employees in the hard-coal industry, these vary greatly according to the different occupations. The largest number of miners average between \$500 and \$600 a year, there being some, however, who earn as much

as \$1,000 a year, and others less than \$400.

Before the miner is capable of performing his work there are certain things he must have. One of these is a miner's certificate from the State. Under the laws of Pennsylvania "no person whomsoever shall be employed or engaged in the anthracite coal region of this Commonwealth, as a miner in any anthracite coal mine, without having obtained a certificate of competency and qualification so to do from the 'Miners' Examining Board' of the proper district. . . ." This board consists of nine members appointed for a term of two years by the judges of the county courts from among the most skillful miners actually engaged in mining. and who have had at least five years' practical experience. All persons qualified to be employed as a miner in an anthracite mine are required to register before one of these boards. order to obtain a certificate of qualification, the applicant must produce satis-

factory evidence of having had not less than two years' practical experience as a miner or as a mine laborer in the mines of Pennsylvania, and must pass an examination before the Examining Board of his district. "In no case," says the law, "shall an applicant be deemed competent unless he appear in person before the said board and answer intelligently and correctly at least twelve questions in the English language pertaining to the requirements of a practical miner, and be perfectly identified under oath as a mine laborer by at least one practical miner holding miners' certificates." The certificate costs the miner one dollar. There is quite general complaint that these certificates are sold promiscuously throughout the region, and that many

THE FOREMAN OF THE BREAKER BOYS

men who never passed an examination are now working in the mine on these certificates.

The miner must also have tools with which to carry on his work. These include picks, shovels, ax, saw, coal drill, rock drill, needle, scraper, file, blasting barrels (where used), drilling-machine for coal, drilling-machine for rock including bits, and chain and

pulley (where used, as in the Schuylkill field, for holding cars in place while being loaded). Where two miners work a chamber as partners or "butties," the expense of tools is usually divided between them. Very frequently miners

are able to secure the tools of those killed while at work, or who have left the industry, at second-hand prices. Most of the tools of the miner represent an original outlay which answers for a long time. Others, however, must be renewed

A MINER

A CULM BANK

This great bank, overshadowing the homes of the miners, is built up of the refuse from the mines

from month to month. To keep his tools in repair costs the miner about fifty cents a month. Including the cost of wear and tear, the yearly cost to the miner for the tools to aid him in his work averages from \$30 to \$40.

Besides these tools proper the miner must have light to work by, and this he secures from his lamp, which originally cost him from twelve to fifteen cents. The wick, or "cotton," and the oil consumed, form a monthly charge of nearly seventy-five cents, a miner using about five gallons of oil each month, at a cost of about fifteen cents a gallon. He also needs matches, explosive caps, squibs, powder, and dynamite, all of which he is expected to supply for himself. he secures from the mining company at \$1.50 for a keg of twenty-five pounds. On the average a miner consumes one keg of powder in getting out thirteen cars of coal. Six cars are regarded as a fair daily output for each man.

Before the miner is able to use these tools and employ a laborer or laborers—before he can engage in the mining of coal—he must have his own labor or energy. This he secures from the food

he eats, the clothes he wears, and the house that shelters him. These are his first demands. They must be supplied, or he cannot for long produce or maintain his labor. The cost of these necessaries, however, is not the same for all miners. In examining a large number of accounts of miners and their families at company stores, and at a number of stores in different parts of the region which were not conducted by the company, but where many miners carried accounts, I found their monthly bills for food and clothing to range all the way from three dollars to as high as seventy-five dollars. Some of the bills were for goods for one person only; others for a family of seven. So many different elements enter into determining the amounts of these accounts that it is not possible to draw an average of a miner's monthly expense for food and clothing that would prove of any value. Some conclusions, however, are possible. In nearly every case the accounts of English-speaking miners are twice and in many cases three times as high as those of the Slav races. show in detail that the miners of the English-speaking nationalities consume

Digitized by Google

a much larger variety and a better quality of goods than those of the Slav races. This is true of the clothes purchased as well as of the food consumed.

The same wide variation in the cost to different mine workers is also found in the rent of houses, which are usually, but not always, owned by the employing company. These range all the way from well-built, neatly painted, and pleasantly located frame houses, with a porch and a large yard, perhaps also a garden, to a one-room hut built of driftwood and roofed with tin from discarded powder-The former have carpets on the floor, bright-colored paper and framed pictures on the wall, and comfortable furnishings in the rooms; the latter may have a dirt floor, bare walls, and store boxes for furnishings, and bunks to sleep Some houses rent for as low as \$1 a month, others for as high as \$8, the average being about \$4 a month. Not a few of the older miners—those of the English-speaking nationalities—own their homes, this being particularly true of the Welsh in the Wyoming field. The Slavs, with very few exceptions, rent their houses, and these usually not of the best or even of the average. These nationalities crowd together in large numbers, not only in the same house, but in the same section of the town, and this usually in the poorest district, where rents are low. The cost of food and shelter to many Slavs is also lessened by the fact of their "boarding" (they being usually unmarried) with members of their own particular nationality, at a cost of from \$5 to \$12 a month. All this indicates how impossible it is to measure in money the cost to the average miner of his food, clothing, and shelter. In any particular case or for any particular group, however, this can be done.

Anthracite mining is regarded as a hazardous occupation. In the entire region there are only seventy-six nongaseous mines, while the gaseous mines number as many as 270. From the latter comes about eighty-four per cent. of the total production of hard coal. At least eighty-five per cent. of the total number of men employed in the mines work in places generating explosive gas.

In the production of hard coal an average of about five hundred lives are lost each year, and approximately fifteen hundred workers are injured. To guard against this risk of his calling—to support himself in case he is disabled or to care for his wife and children if he is killed—the miner pays on the average about fifty cents a month to a beneficial fund, either conducted by the company or by some society which has insurance benefits.

With accidents of almost daily occurrence in nearly every mine that tear the muscles, break the bones, bend the frame, and even take life itself, and with the prevalence of diseases, particularly the much-dreaded "miners' asthma," peculiar to a mining community, the mine worker has frequent and almost constant need of the physician. The possibility of these accidents occurring at almost any time and at unexpected moments makes necessary the near presence of the physician at all times. The injured employees at any one colliery are few compared with the total number of mine workers at that place, and, with their limited resources, they are not able to pay the charges the physician would have to make in attending each accident if he were not assured of other sources of income. The small mining village in particular, situated some distance from the more thickly populated city, has not the continual demand for the services of the physician sufficient to induce one to locate there. The problem has been solved in not a few of the anthracite communities by the company doctor system. By this plan the mine employees support the physician, whether all have need of his services or not, the married men paying one dollar and the single men fifty cents a month. The physician is thus assured of a livelihood, and is at call at almost any time without extra charge to an employee needing his services. In nearly every case where it is in existence this plan is justified by the conditions, despite the fact that it may be an imposition on those having little or no need for the doctor. Unfortunately, the system, in certain localities, is subject to abuses.

Already in the large towns the system

is a thing of the past, the mine worker having the choice of a physician and paying for his services only when he has need of them. This is particularly true in the greater part of the Wyoming field. This change has also been aided by the establishing of State hospitals for the miners in the anthracite fields. All these, however, while they have brought about improved conditions, have not lessened the mine workers' need of the services of the physician; they have only changed the conditions under which he secures those services.

There is another institution in the hard-coal fields of particular interest in any discussion of the labor and living conditions of the mine workers, and this is the company store. The effect this system has on the real wages of the mine workers is not the same in all cases, and for this reason no general statement can be made that would be applicable alike to all company stores. Some are of distinct and undoubted advantage to the mine workers; stores where the general public even finds it an advantage to deal. There are also company stores where it is as distinctly to the disadvantage of the mine employees dealing there, and where no mine worker would deal but for some form of compul-Some company stores are conducted in open and fair competition with the general stores of the mining town for the trade of the community, without the least form of pressure upon the mine worker to purchase his goods there. Other company stores sell only to men employed at their colliery; that is, no one is employed at the mine who does not deal at the store, and no one deals at this store who has the choice of purchasing elsewhere. A majority of company stores charge on the average twelve per cent. more for goods than other stores in the same community. There are, of course, exceptions to this state-

As a system the company store has for years been a source of complaint and irritation on the part of the mine employees, and this agitation in recent years has had the effect not only of remedying its most glaring abuses but of abolishing to a considerable extent the

system itself. The company store to-day is generally but not always conducted by the individual or "independent" operator, and these are growing fewer in number each year. Such large mining companies as the Delaware and Hudson, the Lehigh and Wilkesbarre, the Philadelphia and Reading Coal and Iron Company, the Lehigh Valley, and the Delaware, Lackawanna, and Western, do not carry on company stores, nor do they collect for any of them. They pay their men in cash semi-monthly. Only about one-third of the total number of anthracite mine workers—about 50,000—are employed at collieries having company stores attached. The number of employees affected differs in the separate fields, the largest number being in the Lehigh and the southern part of the Wyoming field. The principal complaint against the company store in the strike of 1900 came from the Wyoming and Lehigh fields.

At the present time about twenty-six different nationalities are employed in and about the hard-coal mines. can conveniently be grouped into two general classes—the English-speaking and the Slav and Italian. The first workers in the hard-coal mines were the English, Welsh, Scotch, Irish, Germans, Canadians, etc., who, with the native Americans, formed the mining population down to the decade following the close of the Civil War. Beginning about 1870 the Slav and Italian invasion swept into the coal fields. It brought with it a group of races wholly different from those already dominant there, not only ethnically but in habits and customs and language and institutions. The Slovak, the Pole, the Hungarian, the Magyar, the Croatian, the Lithuanian, and the Italian, crowded into the mining settlements, precipitating new factors into the then already complicated problem of race assimilation. They came with a lower standard of living, were able to and did sell their labor for a less price—worked for a lower wage—than the Englishspeaking mine workers could afford to sell and at the same time maintain their standard of living. Briefly, down to 1900 the effect of this Slav and Italian invasion was the migration of members

of the English-speaking nationalities not only from the industry but from that section of Pennsylvania. The immigrants in the hard-coal fields from Poland, Austria, Russia, Hungary, and Italy increased from 1,925 in 1880 to 43,007 in 1890, and to 89,328 in 1900. At the present time it is estimated that more than 110,000 representatives of these races are in the anthracite region, the largest number being in the Schuylkill and Lehigh fields. Along with this increase in the Slav races has gone a decrease in the foreign-born from Ireland. Germany, Scotland, England, and Wales, from 123,636 in 1890 to 100,269 in The tendency of the Slav races to increase and of the English-speaking nationalities to decrease in the anthracite industry is clearly shown in statistics of employees of the coal-mining companies. More than this, the movement is distinctly traceable according to the coal fields, the inroads of the Slavs first being marked in the Schuylkill field, next in the Lehigh, and lastly and conspicuously at the present time in the Wyoming field. An interesting and natural phase of this race phenomenon is the increase in the number of Catholic churches in the region and a decrease in those of the Protestant denominations, the Slav being of the former and the Englishspeaking races mostly of the latter. This is explained in the fact that the

Slavs are bringing their own institutions with them, and the English-speaking races are taking theirs away with them.

For the twenty-five years down to 1900 the racial forces in opposition to assimilation between the Slav and English speaking nationalities engaged in the anthracite industry were dominant. But the strikes of the mine workers in 1900 and 1902 put into operation new and different forces, or rather they directed the social and industrial forces along a different channel. On the broad ground of industrial self-interest, racial ties are now being broken down through the instrumentality of the United Mine Workers of America. Through this organization the English-speaking races in the hard-coal industry have been able to control the Slav competition by establishing what is practically a minimum wage in most of the occupations about the collieries. In consequence of the forces which this organization has been instrumental in putting in operation in the anthracite coal fields, we now find industrial and social assimilation between the English-speaking and Slav and Italian races not to be such a remote possibility as formerly. There are indications that since 1900 these newer immigrant races have been responding more readily to the influences of American ideals and institutions.

JOHN MITCHELL THE MAN THE MINERS TRUST

BY WALTER E. WEYL

HE first time Lmet John Mitchell, President of the United Mine Workers of America, was the evening after the declaration of the strike of 1902.

The dining-room in the small hotel was filled with mine workers and union officials about to leave for their respective homes. There was an air of suppressed excitement, and at times men broke out into loud conversation. There was only one man in the room who seemed to feel complete'y the sense of seriousness and responsibility. That man was Mitchell. When he spoke, it was with a quiet and gravity which made me feel with him the greatness of the hazard which the one hundred and fifty thousand men in his union were about to take.

What I felt then, and what I now always feel with him, is a sense of the man's gentleness. There is a mildness in his eyes—the eyes of a dreamer or poet rather than of a man of action—that gives little indication of the great power and the strength of will that lie behind.

I have also seen evidences of this power of will. I have roomed with him for weeks at a time, and have seen him at work from early in the morning until deep in the night, when he was suffering pain that would have sent an ordinary man to bed. The only time I have known him to interrupt his work for any bodily ailment was one Sunday afternoon, just after the close of the strike, when it seemed to me the man would surely die. I left him with forebodings of evil, and was not reassured until I learned the same evening that a few hours of sleep had brought him back to his normal health and to his usual capacity for work.

There are few men who realize what the work of a labor leader like Mitchell really is. I know only one other union official in the United States who works as hard, and I know of none who works harder. Mitchell has a genius for application. He takes his work steadily, as a matter of course, staying at his desk hour after hour as though the passage of time had no meaning for him.

This work of Mitchell's is manifold. The United Mine Workers of America. like other modern trade unions, is well organized, and to a large extent the work is subdivided among many men; but in the final instance the responsibility rests upon one man. Mitchell is able to delegate work, and when he does so he reposes absolute confidence in his lieutenant. Still he finds it utterly impossible to shake off a sense of responsibility. I have seen him worry, and he has told me how he has worried and kept awake thinking about work which he had delegated to others, but which he was not sure would be done in time.

In respect to his own work Mitchell is painfully scrupulous. If he has promised a thing for a certain day, it must be done on that day, and no excuses avail for its non-completion. He is equally scrupulous about trifles. Every letter written to him, even though it be from a crank, receives an answer; and every visitor whom he can possibly receive he sees, if only for a few moments.

Perhaps he is so punctilious because he himself has risen from the ranks, or, as the trade unionist would say, in the ranks. A country lad, born in Illinois, Mitchell naturally drifted into the mines. Here he worked like any other boy, in no wise distinguishable from the other lads of his age. As soon as he could, he began to travel, working in the mines of one State until he had saved enough money to get to another. He saw a great part of the country and learned much that he could not have learned at home.

From the beginning he was a unionist. The boy was appealed to by the

Digitized by Google

FROM STEHEOGRAFH, CLEEHIGHT, 1908, BY UNDERWOOD & UNDERWOOD, NEW YORK JOHN MITCHELL

same sentiments that touch him as a man. A strike in Spring Valley in his youth made a vivid impression upon him and confirmed him in his union principles. He was enthusiastic about trade unionism long before he understood it; he became a unionist because the men whom he liked and whom he respected as good miners were unionists.

The trade union appeals to great masses by its social features and by the multitude of little duties and petty offices The first union office that it involves. held by the young John Mitchell was that of doorkeeper. He stood just outside to announce a newcomer, or to exclude an intruder from the deliberations which the boy himself might not hear. Since then he has moved from the outside to the inside, and from the inside to the very innermost room of the structure. His promotion was at first slow, and the union itself was small and of little outward significance. Afterwards the man advanced rapidly. A record of good work promoted him to the vice-presidency, an accident (the resignation of the president) made him the chief executive of the union, and a half-dozen years of hard work and a series of sensational victories put him in the forefront of the labor movement of the country.

After the close of the strike of 1902, I expected to see Mitchell in an ecstasy of elation. Instead, he was calm, serious, and all but depressed. "I am almost afraid of this victory," he told me, late that evening. "I can never be what the people will now expect of me."

And yet he does not lack and never has lacked self-confidence. When the young man became president, friends came to him and advised him to resign in favor of some older man. But, although under thirty, and boyish-looking for his age, he determined to carry out the work which had fallen to him. true that, in deference to those who considered youth a crime or at best a slowly remediable misfortune, he did for a time wear a long coat to appear older, but in a few months his quiet dignity and effective work had won the esteem of the miners, so that he held his position more firmly than any of his predecessors.

Perhaps this dignity is the strongest

point about Mitchell. There is something about this quiet, reserved man that commands respect and saves him from what might otherwise prove embarrassing situations. I can conceive of nothing so wounding to a man's self-esteem as to be forced to listen to exaggerated laudations by well-meaning but tactless admirers; and I have often seen Mitchell quail before this form of torture. he never loses his poise, and he never wounds the man who is unwittingly hurting him. To newspaper reporters also he is dignified, though at the same time The older reporters know that Mitchell will treat them with equal fairness, and they all soon discover that it is absolutely impossible to surprise an answer from him, or to make him say anything when he has decided to remain silent.

It was this dignity and self-control of Mitchell that excited President Roosevelt's admiration at the conference held between the miners' leaders and the railway presidents in the temporary White House. In this interview every one lost his temper except Mitchell, who was the most bitterly assailed and the quietest and most dignified man in the room. After the conference President Roosevelt said: "There was only one man in the room who behaved like a gentleman, and that man was not I."

So accustomed is Mitchell to continuous work that he finds it difficult to relax. For a number of years he had been planning for the time when he could lay aside for a while the duties of union leadership and take a trip to Europe, and finally, in the summer of 1904, after the affairs of the union had been settled, he decided to go abroad. It was absolutely impossible for him, however, even amid the diversions of such a trip, to leave his work or to drop it from his mind. He had not been in Europe many days before letters came from America and before he was exchanging cablegrams with his home office. I have no doubt that he was thinking of the West Virginia situation or the agreement in the anthracite field while he was examining the treasures of the Louvre or traveling in the lowlands of Scotland. Europe his mind gravitated to the labor and cognate problems, and he was far more interested in housing conditions in London or in the government insurance of workingmen in Germany than in any of the things for which most people cross the ocean.

Few people credit Mr. Mitchell with the really fine intelligence which he possesses. He is intelligent but not intellectual, and his knowledge is real and extended but not bookish. His schooling was defective, but even while he was working as a miner he made every effort to remedy its defects. Down in the mines, by the light of his miner's lamp, he used to study arithmetic between cars. He came out of the earth a wiser and a better instructed man than he entered it.

Mr. Mitchell is a man who learns from all manner of men, and who retains tenaciously whatever he hears of value. He is a voracious and keenly intelligent reader of newspapers, but he has read but few books. Of late years he has started to read works on economics, more particularly on the labor problem, and to extend his reading in other directions, but the life which he leads is too intense and his work too absorbing and nerveracking to permit him to read as widely as he otherwise would. His taste in fiction is simple. I have always thought it typical that the book he seemed to like best was "David Harum." homely wisdom and practical common sense of the old country banker appealed to him far more strongly than a psychological novel or a historical romance.

All of Mr. Mitchell's mental powers appear to be constantly at the immediate service of the man. What he cannot do he does not attempt, and what he does, he does surpassingly well. Whether he is making a public speech or presiding over an open meeting, whether he is granting an interview or writing or dictating a letter, or engaged in negotiations involving delicacy and judgment, he appears always at his very best, and seems to have specialized all his life on the particular task at which he is engaged.

While an orator of no mean ability, he is especially successful in presiding over meetings and in allaying antagonism and distrust. I remember seeing him as

chairman of a meeting of the Anthracite Mine Workers convened for the purpose of calling off the strike of 1902. There was a time during the meeting when Mitchell and his friends who advocated peace might have carried their point against a disgruntled minority by a snap The previous question was asked for, but Mr. Mitchell persuaded his side to postpone this vote until every one who had anything to say had been heard. As a consequence of these tactics, which appealed by their fairness to the minority, the vote was delayed for one day, but the result of it, when taken at last, was absolutely unanimous.

The most remarkable feat which I have ever seen Mr. Mitchell perform occurred during his three days' crossexamination before the Anthracite Coal Strike Commission. There seemed to be a conspiracy to bait the president of the Mine Workers, and the placing of Mitchell upon the stand was the signal for the firing off of volleys of accusations against the miners' organization and its chief with the view of entangling him in contradictions and misstatements. was not easy to justify or even to explain all the actions of an organization and its various members during the five months of the struggle. The situation called for a most active and alert intellect; but Mitchell rose to the occasion in a manner surprising even to those who had the highest opinion of his ability. cross-examining lawyers were met by answers perplexing in their directness and apparent simplicity; and in many cases questions which were to have embarrassed the witness acted as boomerangs, and confounded the lawyers who propounded them. In fact, one of the attorneys who had been most intemperate in his cross-examination found himself before many minutes in the undignified position of attempting to justify the actions of his own client, and, in an apologetic and exculpatory frame of mind, finally brought his futile crossexamination to an end.

The most noticeable of John Mitchell's intellectual gifts are a keenness of perception and a saneness of judgment. He seems to possess the remarkable gift of arousing enthusiasm in others without

being blinded by enthusiasm himself. He seems with an instinctive precision to divine the motives of men, and to see the distant results of an action as clearly as its proximate consequences. perhaps many of his successes have been due less to a calculation of results than to the workings of an innate good taste. When, during the strike of 1902, one of the opposed railway presidents was being attacked all over the country for an unfortunate letter which he had written, there was at least one man who let pass the opportunity of taunting him. In fact, I could never discover in Mitchell any sense of animosity or embitterment toward the men to whom he was opposed. While willing to take any fair advantage which opportunity offered, he did not desire to make his attacks personal or in any way to wound the men who antagonized him. His philosophy in that respect is like that of the trained prize-fighter who feels no hatred against his antagonist even though he is endeavoring to disable him temporarily.

The secret of John Mitchell's success lies in part in his comprehension of the other man's philosophy. He realizes perfectly clearly that the actions of men are determined by their training and by the economic conditions under which they live, and he is no more disposed to hate people for disagreeing with him than to quarrel with the laws of gravitation. He is naturally conciliatory in his speech and seeks to meet men on a common ground, tending rather to emphasize their articles of agreement than their points of difference. It is for this reason among others that so many men opposed to trade unionism somehow feel after arguing with Mitchell that there is something to be said for these doctrines, and conclude that Mr. Mitchell, at least, is a reasonable representative of these ideas.

There is no "give" to Mitchell's trade union doctrines. He is first and last and all the time a trade unionist. With him trade unionism is more than a policy. It is almost a religion. It is in vain to bring arguments against trade unionism to him. He invariably attributes any defects to individual mistakes,

and still maintains that the trade union as such is in no wise to blame.

Mr. Mitchell once described himself to me as an opportunist, but I should rather say that he is an opportunist with fixed principles. His fundamental ideal is the elevation of the working class. His conception of the manner in which this may be accomplished is for the time being the building up and improvement of the trade union. Mr. Mitchell does not look far into the future. He consciously limits his vision to the present generation, or even to the next decade. Beyond that he does not understand, and does not much want to understand; he does not seek to guide his present policy by any possible or probable effect that it may have upon the welfare of any future generation. It is perhaps this intentional short-sightedness, as much as anything else, which makes for the power and strength of the trade union leaders. Mitchell does not know whether or not trade unionism will be a thing to be striven for fifty years from now, but for the present he is content to do everything in his power to work along the lines now laid down.

In many ways Mitchell gives indications of his devotion to the trade union movement. One of these signs, which, however, would not appeal to a unionist, is his continuance in office as President of the United Mine Workers, a position which pays only \$3,000 a year, and which requires an intensity and an amount of work sufficient to kill an ordinary man. Mitchell has never sought political preferment, and he has steadily repelled advances by which he might have secured remunerative positions by giving up his interest in the trade union movement. Part of this steadfastness may be due to mere inertia, and to the glamour and the great sense of power which the position confers; but, this notwithstanding, there can be no doubt that in maintaining his present position he is making considerable material sacrifices for a moral end.

While spending a month in Chicago a few years ago, Mitchell was living in a place where he found it difficult to obtain union cigars. I remember one morning our devoting almost an hour to looking for a place where such cigars

could be obtained, and thereafter he regularly took his morning walk of twelve blocks to get his cigars with the coveted union label. There must have been a pleasure in this sacrifice, since I never could persuade him to purchase these union cigars in sufficient quantities to avoid the daily inconvenience.

With all his keenness, Mitchell is, I believe, a pre-eminently simple, straightforward man. He is interested in simple things, and likes people who are naïve and not subtle. He has no taste and little understanding for personal luxuries. and is not vain enough to enjoy the acclaims and laudations which he re-With scores of friends and thousands of admirers, he is, I believe, really lonely; and with a record of great achievements and startling successes, he does not seem to feel much the happier for them. Some men deserve happiness without achieving it, as some achieve it without deserving it. Mitchell feels the sufferings of the class to which he belongs. He is too close to the toiler to consider his calamities statistically. I have seen him moved almost to tears by the news of a mine accident in which two or three unknown foreign miners were killed, at the very moment when he himself was leading a hundred thousand men into hunger and privation in their struggle for a great cause.

Mitchell is scrupulously honest in a position in which even a slight ambiguity of conduct would be extremely lucrative. Mark Twain once boasted that he was superior to George Washington, because George Washington could not tell a lie, whereas he, Twain, could, but would not. I think that Mr. Mitchell's honesty is of the instinctive Washington kind, and not of the reflect ive or Twain variety. He is absolutely and thoroughly devoted to the men and to his union simply because no other course ever suggested itself as a possibility.

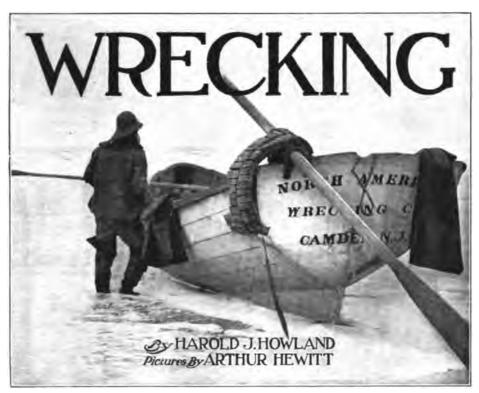

It is characteristic of Mitchell that he believes that no direct attempt was ever made to bribe him. I have a story, at second hand, from a man who himself went to Wilkesbarre with the determination to buy Mitchell, whatever the price. The man was bold, facile, plausible, with

a record which might have been envied by the most enterprising of scoundrels. He arrived at Wilkesbarre late at night, and went straight to Mitchell's room, carrying with him a valise with the goods in it. He came resolved to settle the matter out of hand. He left the room after less than fifteen minutes, without having talked on any subject more exciting than the prospects of the strike or the state of the weather, and without having mustered up courage to propose his dishonorable scheme to the man who gravely and innocently conversed with him.

And yet a man in the position of Mitchell must fear not only attempts at bribery, but cajolery, intimidation, the treachery of secret enemies, and the officiousness and foolish zeal of friends. He is liable to be attacked with the mere idea of drawing him into an unprofitable and dangerous controversy, and he must be able to hold his peace under all manner of provocation. It is difficult to realize how lonely a man like Mitchell may be in his exalted position, with the enormous responsibilities upon him, and it is absolutely impossible to tell how slight a missile may wound him most deeply.

I was once told by Mitchell that the thing which pained him most during the strike of 1902 was a letter received from a man in Chicago telling him that during the strike his wife had been run over by a train while picking up coal along the railroad. "If you ever come to Chicago," the man wrote, "I will surely kill you, though I will give you a chance for your life." It was simply one of a hundred letters of intimidation, but the single note in it of the wife dying as a result of this strike clouded for months the horizon of Mitchell, so that he constantly dreamed of it.

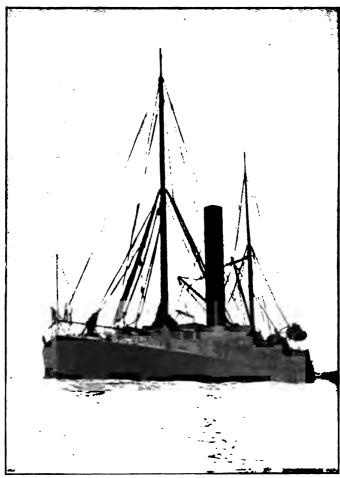

It is by reason of his qualities and their defects, by virtue of his powers and his limitations, that John Mitchell is so mighty and beneficent an influence in the labor world. He is the ideal trade union leader because he is singly and always for the union; because he limits his efforts to the immediately attainable, and because, without compromise, he reconciles opposing factions.

N the outer edge of the famous Board Walk at Atlantic City, just where it makes a bend toward the Inlet, stands a square watch-tower. It belongs to the Atlantic City Life-Saving Station, and beneath it swings the big surf-boat, ready at need to be lowered into the waves that wash about the tower's feet. It was a raw Sunday morning with a brisk wind from the northeast dashing the fine rain into our faces as we tramped along. We clambered up the iron ladder and knocked at the trapdoor in the floor of the tower. door was lifted, and a helping hand pulled us up into a little square room, well filled The life-saver is never a with men. demonstrative fellow, and we did not expect an enthusiastic welcome. every one in the room was too preoccupied even to notice our arrival, and we dropped into a corner with no desire to interrupt the proceedings. At the front window crouched burly Captain Parker, his eye to a telescope, and his whole attitude expressing concentration. his elbow stood a young surfman, with the

black-bound International Signal Code in his hand. Following with our eyes the direction indicated by the telescope, we saw out at sea a steamer, with two masts and a curiously tall funnel, lying quietly as though at anchor. It was the Cherokee, from San Domingo for New York, with a general cargo and a dozen passengers. She had run into fog, lasting for four days, and in the midst of it she found herself fast aground on Brigantine Shoals. To one unfamiliar with that shore and the treacherous nature of those ill-famed sands, there was nothing to indicate the desperate situation of the vessel. In front of the tower, to be sure, and to the east where the Inlet separates the city from Brigantine Island, the foaming breakers showed the presence of shoal water extending far from the beach. But the steamer was too far out for the eye to distinguish the waves which were doubtless breaking over her decks.

"She's just hoisted her ensign and the code flag, to show she wants to talk to us," whispered the life-saver who had opened the trap-door for us. "We've

THE CHEROKEE FAST ON THE BRIGANTINE SHOALS

run up our answering pennant, and the Captain's looking for their signal."

In the silence that followed we could hear the slat of the halliards on the flagstaff above our heads, where our pennant was hoisted at the dip, telling the steamer that we were all eyes for her message.

"They're slow enough about getting that signal up," growled the Captain; and a young life-saver remarked, "Don't suppose they feel any too brisk out there this morning, after last night. Wonder if they had any fire! Say, that wind did blow some, didn't it?"

A muttered exclamation from the Captain forestalled any reply, and we strained our eyes again anxiously through the gloom. There was plenty of cause

for anxiety. The Cherokee had been for forty hours in the sands, and the northeast storm which had been blowing throughout the night must have driven her faster into their grip. There were half a score of passengers on board, forty-odd of her crew, a dozen men of the wrecking crew of the tug North America, and two life saving crews who had gone aboard her soon after she struck.

"There she is," cried the Captain at last. "D;" a pause, then he muttered, "Square flag, yellow and blue diagonal stripes. What's that? Oh, yes: Y." Another pause, while he screwed the glass into a little better focus. "E—D, Y, E. Look her up, Jim."

Jim, with hands stiffened by much

handling of the oar, slowly turned the pages of the Code Book, followed down a column with a thick finger, and announced: "DYE. All well."

A subdued shuffling of feet as each man shifted his position a little, and a hoarse clearing of the throat by one or two, were the only signs of the relief the message had brought to us all.

"Hoist the pennant, Ed," directed the Captain, and in a moment our code flag was flying clear up, telling the steamer's people that their signal was understood.

Captain Parker took up his glass again, and with much less delay this time was able to announce the next signal, "Code flag under U K," which Jim interpreted as "Ten." "Ten what?" asked one of the landlubbers, innocently, to be met with the brief reply, "Don't know. That's coming."

Again our pennant was hoisted clear up and dropped to the dip, and quickly a third string of flags completed the message—"feet of water in the hold."

"Ten feet of water in her hold! That's bad!"

"She must have opened up after that pounding she got last night. She'll

never get off now. No use trying to pump her out with the hole she must have in her."

"Don't believe it. She took it in through her hatchings. The seas were breaking right over her all night."

"Why, man, they wouldn't dare to stir her hatches yet. I'll bet her engines are right through her."

The discussion grew heated and complicated, with frequent references to wrecks of bygone years and strenuous citations of the long and varied experience of the debater in all matters connected with the sea.

But we were more interested in the practical side of the wreck than in any-body's theories about it. We wanted to get on board the Cherokee, and we turned from the discussion to ask the Captain how it could be done.

"Want somebody to take you out to the steamer? Well, you might get some of those fishermen up at the Inlet. Say, Cap," he continued, turning to address an old man in a pilot jacket who was quietly smoking in a corner, "do you know of any boat that might take these boys out to the Cherokee to-day?

WAITING FOR THE SURF TO GO DOWN A LITTLE

There's a powerful sea running out there," and he indicated with a sweep of his arm the waste of breakers which lay between us and the ship.

"Cap" rose stiffly from his chair, gazed for a moment out over the waters, his eyes shaded by his hand, and replied, "Waal, guess none of those fellers would want to go out there to-day 'thout they had some almighty good reason for it. There's the Alberta, now. She might do it if you pa'd enough for it. She's the best boa. sailin' out of the Inlet."

"I heard this morning," broke in the young lifesaver called Ed, "that Casto refused an offer of a hundred dollars

to go out to the ship yesterday."

"Waal, he might go to-day, if ye paid him right. But if Mark Casto won't go, nobody else would dare to."

Discouraged by this statement of the case, we determined to go over to the South Brigantine Life-Saving Station, the nearest station to the shoals where the steamer lay. A few hours later we embarked at the Inlet in a Bank skiff fitted with a gasoline engine, navigated by a genial fisherman of uncertain age, with spectacles resting far down on his nose, and a spark of dry humor in his eye. We had just learned that Mark Casto and the Alberta had gone out to the Cherokee at eleven o'clock. But it was no promise of pay that had made

Foreman of the North America's wrecking crew.

him drive his little schooner through those foaming breakers to the side of the stranded vessel. It was the message we had seen signaled the morning, "Ten feet of water in the hold," that had made him resolve help that to stranded company if he could. As we circled round the serpentine curves of the channel that leads through salt meadows to Brigantine's back door we could see, now dead ahead, now abeam, now astern, as the vagaries of the channel whirled us about, the Alberta lying to not far from the Cherokee. Her mainsail, sheeted in, was shaking in the wind, and her mastheads performed

tesque dance as she rolled and pitched with the waves. What they were doing out there we didn't know; but soon her foresail was hoisted, then her jib, and she filled away toward Atlantic City.

The South Brigantine Life-Saving Station is an old and incommodious building, hardly a credit to our Government's sense of generosity in providing for its faithful servants. But you can get as warm a welcome there as in the finest station in the service, and the appearance of the building is no criterion of the spirit which it houses. Captain Smith and most of his crew were still on the Cherokee, but two surfmen had come off with the crew of the Brigantine station, their neighbors to the north. After

dozen supper a members of a wrecking crew, who were waiting for an opportunity to get aboard the steamer and assist their comrades already there in doing all that was possible to save the vesseland her cargo, dropped in, one by one, from the neighboring hotel.

" Well, George, how's it been out on the steamer these two days? Been hard?" working asked the captain of the wreckers, as he pulled up a chair and extended his luxuriously legs under the stove. George, thus addressed, was Surf-

man George Blackman, the Number One of the South Brigantine crew. He had just been promoted to the position of Keeper of the Forked River Station up the coast, whither he would betake himself in a few days. He shivered and drew closer to the fire.

"There's one thing I'm sure of," said he; "the water's blamed cold out there."

"How do you know? Been in it?' queried the wrecker.

"You bet I have. I was thrown out of that lifeboat as clean as anything you ever saw."

A TRIO OF WRECKERS

He hugged himself a little tighter as he recalled his icy bath, and then continued, "But we got every one of those passengers and the crew aboard the Alberta without hurting anybody, and that was pretty good luck with that sea running. Mine was the only accident there was, and I guess it didn't hurt me any. I've been twenty years in the service, and if I was to stay twenty years more I wouldn't expect to do a harder day's work than we did out there to-day."

In response to a little urging, he told us, simply and quietly, the story of the

pasttwodays. The crew of this station had gone out to the steamer soon after she struck, and not many hours later the North America. the wrecking company's big seagoing tug, appeared and sent a big hawser aboard the stranded ship and set herself doggedly to the task of pulling her off. The sea was quiet, and the captain of the Cherokee expected that at any moment she would be freed from the sands. So the life-savers' offer to land the passengers in their surf-boats was courteously de-

clined. The North America kept at her work all day Saturday, but the steamer had run far on the shoals, and the Brigantine quicksands have a tenacious grip. Saturday evening it began to blow hard from the northeast, and the tug had to slip her hawser and run to sea for safety. that night the wind blew merrily and the seas broke spitefully over the deck of the captive vessel, throwing the spray It was an almost to her mastheads. anxious night for all on board, and crew and passengers were glad of the presence of the life-savers with their stanch surf-Sunday morning found steamer a mile nearer the shore and settled more securely in the sands, the "ten feet of water in the hold" forcing her gradually deeper and deeper. It was useless to think of taking the people from the ship in the surf-boats with so heavy a sea running, except as a desperate last resort. The time hadn't yet come for that, and there was nothing to do but to wait.

It was about noon that the Alberta came out, driving straight across the bar, where a record high tide gave her all the water she needed. Working the schooner round to windward, Captain

Casto dropped anchor three hundred and fifty fathoms away, and paid out his cable slowly until the Alberta was within a hundred fathoms of steamer. With two of his crew he launched a dory and boarded the Cherokee with the dry query, "Anybody want to go ashore?" There were plenty who did, and the lifesaving crews, aided by Casto and his men and by the wreckers. undertook the work of transferring passengers and crew. One of the steam-

CAPTAIN MARK CASTO

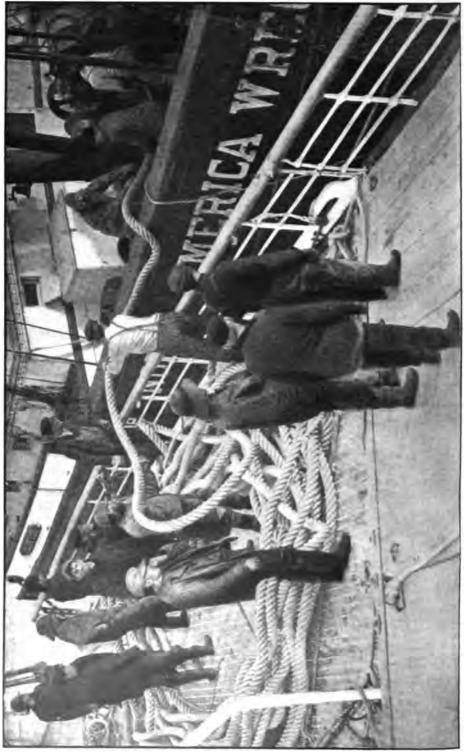

er's lifeboats, with lines from her bow to each of the two vessels, was ferried back and forth till all the ship's company except the captain, the first officer, and the carpenter were crowded in the Alberta's tiny cabin and on her deck. The waves rolled level with the steamer's deck, and at times the watchers could hardly see the Alberta as a sea broke over her, smothering her with the spray. Four boats were lost before the rescue was complete. One of the Alberta's dories was stove in as she crossed the bar; the other was swept away by a sea which snapped the line by which it was being slacked away from the steamer's side a

THE BOAT THAT DID THE RESCUING
The dent in its side shows where it struck the Alberta

THE ALBERTA LANDING A LOAD OF CARGO FROM THE CHEROKEE

moment after Casto and his companions had left it; one of the ship's boats, used to carry a line to the Alberta, was overturned and swept away, again just after its occupants had quitted it; another was snatched from the davits where it hung above the steamer's rail.

Many journeys had been safely made by the little boat when, as she started away from the Alberta's side, a sudden sea swept her back with a vicious slap against the schooner's rail. Almost before he knew what had happened. George was thrown, as he explained it, "clip an' clean" into the water ten feet from the boat. His cork jacket buoved him up. and a few strokes brought him within reach of the line thrown him by his companions. He wasn't in the water many minutes, but it doesn't take a long swim in January to chill the blood even of a seasoned life-saver.

After a climb to the cupola of the station for a look at the lights out at sea, showing where the tug and lighter lay ready for the morning's work, we turned in for a good sleep, broken only by a call to the telephone to tell some newspaper man that there was nothing new from the wreck.

The next day we went out to the stranded steamer with the life-savers. A first trip from the beach in a surf-boat with a good sea running is an experience to be remembered, and to be avoided if your nerve is not quite steady. is, first of all, something a little ominous in the businesslike way in which they strap you into a cumbrous cork jacket. The rollers breaking on the beach have a savage look as the Captain waits for the right moment to give the word; and when you are well into them, the ease with which they shoulder the boat high in the air and drop it with a slap into the succeeding trough is impressive. But the seven sturdy surfmen handle their fourteen-foot oars as easily as you would a canoe paddle, and the Captain standing above you, as you crouch in the stern, guides the big boat with the long steering-oar, with a finesse that is even more impressive than the blustering forcefulness of the waves.

On the steamer's deck we found her Captain, plainly worn by the strain and

anxiety of the past few days, but with an expression of eye and mouth that told of courage and nerve unbroken even by this first disaster in his many years of service. Decks, cabins, staterooms, and gallery showed a sad con The ten-inch hawser of the wrecking tug in a huge coil on the forward deck was a witness to her prompt but unavailing effort to foil the greed of the sands. A hoist of signal flags trailed on the deck from its slack halyard; miscellaneous ropes, usually coiled away, shipshape, on handspikes or in lockers, lay scattered promiscuously; a barrel of hardtack stood open in the saloon; on the bridge a china plate bore fragments of icing from a Christmas cake; in the staterooms the little accompaniments of travel, a tooth-brush, a comb, a bunch of magazines, a razor, had been dropped or forgotten in the hurry of departure. Confusion had even penetrated to the pilot-house, the inner sanctuary of seamanship and orderliness, where the mute engine-room telegraph, its pointer at the words "full speed astern," told of the moment when the touch of the shoal was felt. On the lee rail the hand lead, which for some mysterious reason had failed to warn the mariners, bewildered by the fog, of the dangerous shallows so near at hand, hung in its useless coils of line.

A trip down the after-companionway ended abruptly in an expanse of water covered with floating débris, and with table-tops rising above in the dim light like shadowy islands. The "ten feet of water in the hold" had doubled, and the water without and within was at the same level, rising and falling with the tide. Until that water could be got out, the good ship Cherokee would stay where she was, nestling slowly but inevitably into the coaxing, cruel sands.

Whether the water could be got out was for the North America's big pump to say, as soon as the sea was calm enough for it to be put aboard. Meanwhile there was plenty for the wreckers to do. All the ship's fittings that could be carried away must be collected and transferred to the Alberta and some of her companion smacks, to be taken to Atlantic City, with as much of her cargo as could be reached at ebb tide. As we

TAKING A HAWSER OFF TO THE LOTTIE

left the steamer that afternoon they were busily ripping up carpets, unscrewing lamps, candle-holders, mirrors, and washbasins, coiling up ropes, stripping the pilot-house and bridge of chronometer, compass, binnacle lamps, and charts.

A wrecker has need of an ample stock of patience, as we found out during the next two days. A blow from the northeast, hardly half a gale, but enough to make approach to the stranded steamer difficult, kept us all on shore, kicking our heels and listening to stories of former wrecks from the old-timers of the company. Every one had left the ship soon after we did, for they could do no good by spending the night there, and a sudden storm might add danger to the discomforts of life on the cheerless deck. Only a quartet of watchmen, armed with Winchesters, garrisoned the vessel; for there are other "wreckers," descendants of those rough men of olden days to whom a wreck on their shore was treasure-trove brought to them by Providence, and not always an unassisted Providence.

At last the wind swung to the west, smoothing out the sea. In the gray morning chill, at an hour so early that the too-civilized processes of an Atlantic City hotel could not compass

even the thought of breakfast, we groped our way across the wharf to the deck of the Alberta. A hail down the companionway to our friend the cook brought up cups of coffee, huge sandwiches of fried eggs, and a handful of cookies. By twos and threes the wreckers appeared from various directions, and we were well across the bar before the sun began to drive away the morning mists. Once on the ship the hustle began. The tide was at the ebb, and in the next few hours they must get out as much cargo as they could. A fishing-smack was laid alongside amidships, and through an open port a miscellaneous collection of merchandise was poured into her. Bags of raw sugar, soaked in salt water till half their contents was dissolved, and they became slimy, slippery masses of stickiness; great square logs of satinwood; misshapen chunks of fustic or yellow-wood, the raw material of dyestuffs of many colors: round logs of lignum vitæ destined to become bowlingballs, ship's blocks, rulers, and pestles; bales of sisal hemp, a product of a kind of century plant, and the best fiber for making cordage, next to manila hemp. Not only cargo but a dozen handtrucks, used for loading and unloading when in port, great coils of hawsers and

mooring-lines, heavy chains for hoisting cargo from the hold, were dragged out and stowed away on the smack.

Overhead, at the ship's rail, stood the jovial little custom-house officer, carefully noting every bag of sugar, every log of wood, every bale that left the ship, for nothing must pass Uncle Sam's protective wall, even in case of disaster, without his knowledge and consent. Beside him a young member of the wrecking crew kept equal tally of the cargo, and, besides, a list of everything belonging to the ship that went ashore; for the insurers, who in this case controlled the wrecking company as well, must keep good track of everything that is landed, for what they can save will

help them out on the insurance that they must pay.

Below in the 'tween-decks a gang of wreckers, rubber-booted to the hips, and armed with iron hooks, waded through the dirty flood and dragged the cargo to the open port. The pale wintry light from without mingled with the smoky gleam of a couple of ship's lanterns, and half revealed a scene weird and unnat-The incongruity of this expanse of water inside the ship, the tide rising and falling, the swells sweeping regularly through her in unison with those without, emphasized the pathos of her plight. On deck the work of dismantling was going on; all the metal fittings, stateroom and cabin furnishings, everything,

FITTING UP THE BOILER

in fact, that was movable and detachable, went over the side into the rapidly filling smack.

The North America, with her big attendant lighter, the Lottie, lay out at sea, as near as the depth of water would permit. Toward noon a surf-boat put

over toward us. It was lowered lightly into position on our deck, to be followed by the centrifugal pump, looking like a great snail-shell mounted on a pedestal for exhibition purposes. The engineer and his assistants followed—not, however, by the derrick route—and began, with

ONE OF THE ALBERTA'S CREW

out from the steamer bearing the free end of a hawser from a coil on deck. The end was taken to the Lottie, made fast to her steam-winch, and the broadbeamed craft began to pull herself in, hand over hand, to the motionless steamer. She came alongside, and made fast bow and stern; one of her big derricks picked up from her deck, like a toy, a twenty-foot boiler and swung it workmanlike despatch, to fit up pump and boiler with their proper steam-pipes and valves. They cut a hole in the deck and dropped a six-inch inlet pipe far down into the water in the hold.

With them came Captain Gibbons, the company's wrecking-master, and for over a score of years in command of the North America. If his face was shriveled as if by the force of the ocean winds,

and the watery blue of his eye seemed to reflect a little the element whose work he had so many times striven to undo, there was no lack of force and decision in his character. Things began to move a little more rapidly and to better purpose as he took command in person. He was a quaint figure in his little overcoat of pious black and his hat that aroused at once the enthusiasm of the artist, who cannot quite forget his English origin, and who whispered, "By Jove, that's a real 'bowler' hat; it's a beastly long time since I've seen the real thing."

The Captain looked over the vessel with the eye of experience, and pointed out how the deck in the smoking-room was bulging and how the woodwork in the corners of the room was racked. "That shows it," he said; "it wouldn't hump up that way unless her bottom was broken. I'm afraid it won't be much good to start the pump going, but the owners want it tried, so we're going to try it. If this wind shifts, though, we're likely to lose our pump and boiler It wouldn't take many seas breaking over her the way they did the other night to pick them clean off the deck. Well, let 'em go; they don't owe us anything. They've done some good bits of work in their time."

We asked him about the night the North America had to slip her hawser and run for it.

"Well, sir, I held on as long as I could. But it didn't look as though they were having a good time on the steamer

The seas weren't breaking over her house; they were breaking over her mastheads. I tell you, it did blow. I was sure then that her bottom was broke. She couldn't have stood that pounding and not opened up some. I knew that even if we did get her off that night and out into deep water, she'd just as likely as not go straight to the bottom. didn't want to risk it, you can be sure. Men are worth a lot more to me than ships—especially when they're women." Leaving final directions for the pumping at the next flood tide, the Captain went aboard the Lottie. With a hawser to the North America this time, she walked herself out to her berth again, and soon started off behind the tug to the Delaware Breakwater after coal.

As we left the steamer that afternoon the pump was all ready to begin its task in the morning—a task that seemed to promise about as little practical result as the proverbial operation of trying "to spit to windward."

Back in the city a few days later, an item tucked away in the corner of the morning paper provoked moralizations on the uncertainties of prophecy and the particularly hazardous nature of the business of making predictions in the case of ships and other feminines. It read:

Atlantic City, N. J., Jan. 27.—The stranded steamer Cherokee was entirely cleared of water by the pump last night, and was promptly freed from the shoal by the wrecking tug North America. She proceeded to New York in tow of the tug this morning.

PHOTOGRAFIE BY FACH DESTREES NEW YORK

JAMES R. GARFIELD

THE FIRST COMMISSIONER OF CORPORATIONS

BY GAILLARD HUNT

HERE is no severer test of character than that which comes to the children of men of great Flattery and indulgence surround them and combine for their undoing; and this is especially the case when the father occupies such an eminence as the Presidency of the United States. In attaining this supreme position there are no preparatory gradations, but he and his family are suddenly lifted up to an altitude in which they have been wholly unaccustomed to live; for the distance between any other public position in our country, however high, and the Presidency is not measurable, it is so great.

When James A. Garfield was the leader of the House of Representatives. he lived a retired family life, surrounded by a family of five young children, who attracted no more attention than the children of a hundred other men in Washington. Every summer they spent upon the farm at Mentor, Ohio, surrounded by neighbors who lived as simply as they did. They had, however, an advantage over other children, for the father was a gentle and persistent teacher. He had at one time been a school-teacher and a preacher, too, and the home was a place in which the children learned while they played, and heard sermons without knowing they were being preached to. This father was a great scholar, who knew his Horace as well as he knew the Republican platform, and could discourse with equal facility upon the Books of Moses or the tariff, and he talked to his children about the subject in which he was interested. In nature he was himself a boy, and a very lovable boy, and his own boys had a romantic love and admiration for him and patterned after him. The mode of life and bringing up of this family were idyllic, and there was nothing to indicate that it would change until the children

should go out in the world to start homes of their own.

In June, 1880, the two eldest boys were at St. Paul's School, waiting for the school term to close, when they would join the rest of the family at the farm. The father was attending a convention to nominate a candidate for the Presidency; but the family would soon be united at the farm, and plans were already being made for the summer; when, without a word of warning, a thunderbolt fell and shattered all the plans. father was nominated for the Presidency, and for the next six months the farm was a place of turmoil and confusion. the centering point for millions of pairs of eyes and the resort of thousands of visitors. They looked first upon the candidate, and then upon his farm and cattle, and then upon his wife and children, and pictures and descriptions of them all were sent far and wide. The pretty lawns around the wooden house were flattened by myriads of feet; the fences were broken by the crowds; brass bands came every day and rent the air with blaring music, and orators shouted out speeches to a gentleman who stood upon his own porch and realized that it was his own no more—that he had accepted service of a new master who would permit him to have no private life, and that the simplicity and charm of the home circle were gone.

From Mentor the Garfields moved into the White House at Washington. Any week-day the people can walk into the house from the street and satisfy their curiosity by wandering through its corridors and testing the chairs in the great East Room; for it is their house and the occupants are merely tenants at will. When General Garfield was President, the house was also the public executive office, and a thin partition was all that kept office-seekers from intruding into the bedrooms. Assuredly, the

surroundings were not those in which an intelligent father would wish to rear a boy.

When James Rudolph Garfield, the President's second son, went to live in the White House, he was sixteen years of age, probably the most critical age of He was a harum-scarum, ubiquitous boy, and Washington soon came to know him well. He rode horseback a great deal and often rode fast; he had a choice group of associates who were no more civilized than himself, and their pranks were interesting and various. Young Jim was seen driving a four-mule team before a farm wagon one day, and there was a rumor that he had taken a swim in the White House fountain late one night. The serious throng that frequented his father's office was often startled by loud whoops coming from other parts of the house, where Jim and his companions were engaged in frivolous pursuits. If he had not had an elder brother more staid and sober-minded than himself to guard over him, there is no telling what extravagance of conduct he might not have committed.

The White House life lasted only a few months, and closed in gloom. The adored father was stricken down, and before death had claimed him his two elder sons were at Williams College. After the father's death the world forgot James went through college quietly and creditably. The early training had laid a foundation which the dangerous surroundings during the Presidential period had not shaken, and upon this foundation he began to build. graduation he tested his leaning for a doctor's life and studied medicine, but, finding that he preferred the law, he went to New York and entered a law office and the Columbia law school. He took his degree and went back to Ohio, and soon the firm of Garfield and Garfield, lawyers, was doing business, the senior partner being that elder brother who had been James's monitor when they lived in the White House.

Mentor is an attractive place. The old house which President Garfield owned has been much enlarged since his death, and near it is the handsome house which James built for himself as

soon as he had the necessary money. The village itself is a model village. There is a good free library, which was established before Mr. Carnegie began giving libraries away; a neat town hall; a well-kept street which is lighted at night; and a sturdy little lock-up, which is seldom occupied. The village is well governed, and a part of this government James Garfield was from the time he became a lawyer until he accepted a Federal office, and he worked hard to give his village as good a government as any other village in the land. He believed that his first duty lay in this village, and Mentor admits that it owes him a great deal.

While he was still helping to govern Mentor he was elected to the State Senate, and his service there was especially notable for two measures with which he was identified—a Corrupt Practices Act, which he carried through triumphantly, and one of the best-drawn civil service bills ever offered in a State legislature, which failed of passage. The Corrupt Practices Act was a thorn in the sides of the bad politicians of both parties for several years, and one day, after he had left the Senate and was absent from the State in California, they repealed it. He had by this time acquired a goodly number of enemies among a certain class of men, who realized that he would become a power in the State and that he was an inflexible man.

In the State Senate a tough old member who wished to brand him as a "purist" once blunderingly called him a "Puritan," but in reality he is both, for he comes of that Puritan stock which lost nothing of its strength by being transplanted from New England to the Western Reserve. James Garfield's father was a member of the Christian Church and his mother a Presbyterian, and he himself joined the Presbyterian Church early in life, although he often attends the Episcopal. He belongs naturally to a northern religion, and although he has been known to go to a Catholic church, there is no probability of his ever asking to be received into that fold. While the formative part of his life was most liberal in its mental surroundings, it was in its routine and conduct a strict and

Digitized by GOOGLE

simple life regulated upon New England traditions, and these have clung to him and formed him. As for his being a purist, he belongs to the band of young reformers who have entered public life with the avowed purpose of fighting the old politicians and bringing in a new and higher order of things, based neither upon machines nor spoils.

After two terms of service in the State Senate, James Garfield was announced as a candidate for the nomination for Congress. Most of the people in his district wanted him, but there were certain men who were determined not to have him, and, seeing no other way to prevent his nomination, they cheerfully cheated him out of it. A few years afterwards Theodore Roosevelt sent for him and asked him to be a Civil Service Commissioner. The place is not a difficult one for an honest and strong man to fill, but it is one which tests a man's honesty and strength. A Commissioner's friends, not realizing the impropriety of their doing so, constantly appeal to him for assistance in obtaining Government positions. He can, if he chooses, tell them where there are vacancies, and might, if he were a scoundrel, indicate what lines a Civil Service examination will follow. It is astonishing how often honest people ask him to do this very thing. James Garfield's first experience in Federal office was thus in a place where he could not only learn a great deal about the executive machinery of the Government, but where he could see some of the most disagreeable features of place-hunting.

When he came to serve on the Commission, he was himself seen for the first time by that world in Washington which runs the Federal Government and has a great deal of power. It saw a young man, thirty six years old, six feet tall and straight as an arrow, with a broad chest and no superfluous flesh on his bones, with a wide face and a sweet mouth like his father's, and big eyebrows already growing bushy over his gray eyes. found him with polished manners, on occasion courtly, on occasion genial, and on rare occasions cold. In intimate social life it was charmed by his frank boyishness. It found him in disposition

an optimist, looking at the bright side of things, and always ready to make the best of situations even when they became disagreeable. It found that he said Yes or No with equal readiness and meant what he said; that he had, indeed, the poise of an older man, and did not have

to unsay things.

Now, this Washington world knows what it is about, and those who constitute it look to their interests and gauge new men more or less accurately. They are all after something or other, and a man is of importance to them according to his power. They saw a coming man in James Garfield and lionized him accordingly. They saw, as a chief circumstance to justify the lionizing, that the head of the State had received him into such friendship and confidence as he has given to few others. No one was surprised when he was selected to be the first Commissioner of Corporations, although from the President's point of view there was no office under the Government of greater importance than this In a few years' time the question must be decided of how far the National Government will go in supervising the conduct of corporations engaged in business of National extent, and the question is a mighty one, with Socialism lurking at one end and organized robbery at the other. When Garfield entered upon his new office, no one knew what he would do. He might hale the trusts before him and shake their bones; and, if he did so, he would be applauded by a large crowd of onlookers. A man might even ride into a nomination for the Presidency by that road. Or he might stand for a comfortable and inactive conservatism, which would please men who know the way and have the means to make those who oblige them prosperous and happy. It soon became evident, however, that the Commissioner of Corporations was not studying to please either the crowd or the conservatives, but that he was following a policy of his own and keeping his counsel concerning it. When his first annual report appeared, it showed that he was in favor of effective Government supervision of big corporations and not opposed to the existence or formation of big corporations, and that he was preparing to present a plan for accomplishing his purpose. The report is an able and conclusive argument in favor of Government supervision—the best, in fact, that has thus far appeared—and it put the author's reputation upon solid ground. It is written with perfect fairness, and is a good example of close logical reasoning and scientific treatment of a subject which is usually treated. from a sentimental standpoint. There is an entire absence of striving for popularity; and when the Commissioner began to investigate the trusts, there was the same indifference to attracting public notice. For example, when he made his report on the Beef Trust, the public was disappointed because he did not say to what amount it was being oppressed. The average householder was looking for a report which would give good reason for his being enraged at the price he was paying for his beefsteaks, and did not, of course, notice the opening page of the report, which warned him that it was only partial, and that, as another Department was investigating a certain phase of the subject, the Commissioner of Corporations could not discuss it. The packers took the report with elation; and afterwards, when they were

on trial on a criminal charge, endeavored to show that the Commissioner had been guilty of bad faith towards them, else they would not have been tried at

When the friends of James Garfield read this shocking charge, there was not one among them who did not feel certain that it was false. The Attorney-General promptly said that the prosecutions he was conducting were not based upon information furnished by Garfield, and that disposed of the charge, so far as the public's opinion was concerned; but to those who know the Commissioner of Corporations, the Attorney-General's statement was unnecessary, for to them it was an impossible supposition that James Garfield could break faith with any man.

When the matured scheme for corporation supervision shall have been presented—a scheme which will offer a means of preventing the evils for which there are now occasional prosecutions after the evils have been committed—the public will know that the credit for the outcome belongs largely to James Garfield, and that there are few other men in public life who could do what he is doing towards the solution of the most difficult problem of the day.

AFTER

BY FLORENCE EARLE COATES

After the darkness, dawning, And stir of the rested wing; Fresh fragrance from the meadow, Fresh hope in everything!

After the winter, springtime
And dreams, that, flower-like, throng;
After the tempest, silence;
After the silence, song.

After the heat of anger, Love, that all life enwraps; After the stress of battle, The trumpet sounding "taps."

After regret and doubting,
A faith without alloy,
God here and over yonder,—
The end of all things—joy!

THE FOREST PRIMEVAL

BY PHILIP W. AYRES

Forester of the Society for the Protection of New Hampshire Forests

ILLUSTRATED WITH PHOTOGRAPHS BY THE AUTHOR AND OTHERS

THE LAST OF NEW ENGLAND'S WHITE PINE

BIG Tom Wilson was a famous guide in the high mountains of North Carolina. Looking for his house, forty miles from a railroad, I came upon him in his corn-field, unmistakably Big Tom, tall, gaunt, and deep-chested. His long, somber face, with keen eyes, lighted up eagerly to meet a stranger, for visitors were few in that distant valley. Immediately he agreed to go with me to the top of Mount Mitchell, the highest point in all the Appalachian Mountains. It was my good fortune to have to wait a day at his house before he could make the trip. This was a typical mountain home of

the region. Its main feature was the wide, sunny "porch," as wide and long as the house itself. A spinning-wheel wound with fresh yarn stood near the door, and a home-made armchair and a long bench at one end were offset by some boxes of "setting" hens at the other. A couple of dogs lay lazily in the sun, and there was an assortment of articles hanging on pegs—firearms and fishing-poles, harness and farm tools. Back of the porch was the main room of the house, clean, with a wide fireplace, and several feather beds covered with blue counterpanes. The lamps were simple tallow dips, for it was "unconvenient"

THE PRIMEVAL FOREST AT THE BASE OF MOUNT JEFFERSON, NEW HAMPSHIRE
This forest has now been removed leaving an expanse of devastation like that shown on the opposite page

to carry kerosene and chimneys in saddle-bags over the mountains. There were no books or papers of any kind, except a copy of the Bible, which Big Tom said he could read, "because the words are easier to spell out than in books and papers." Scattered through the valley in clearings above the home farm were the log houses and plain frame houses of the married sons and daughters of the family. Big Tom had the distinction of having the only two appletrees in all the region. At the lower end of the valley the nearest neighbor's daughter, a barefooted girl of twenty, was hoeing cabbages in a garden. She had never been out of the valley, and, never before having heard of New York, allowed that it must be very "fur off."

On a glorious summer morning we started up the mountain, carrying an ax and an old pistol that Big Tom always took into the woods, our blankets and provisions strapped to the back of a mule. By a roundabout way he took me to a "moonshine" whisky still whose whereabouts he knew—for there were rattlesnakes on the mountain. He was a temperate man, although he said that

the way to take whisky for rattlesnakes is "to have it in ye, jest before ye're bit." We soon got beyond the timber that had heard the sound of an ax into the prime-val woods.

We stepped up through ferns and rich moss, kept green by the great number of little streams that ran down the mountain. There was little undergrowth because of the dense shade above, save here and there large clumps of evergreen shade-loving laurel. The magnificent boles of the tulip poplar trees measured sometimes five feet in diameter, and the rings of one that had been felled for the honey of wild bees showed four hundred years of growth. There were many species of trees—white oak, red and black oak, hickory, beech, and the birches. On a gravelly ridge were groups of ancient chestnut-trees whose bark was plowed in deep ridges; and in a fertile cove higher up the hard maple and the familiar Pennsylvania maple, for in these mountains the Northern flora meets the Southern. On the lower slopes occur rich forms like rhododendron and the flowering dogwood; higher, the white pine and laurel of New England; and higher still the

spruces and firs of northern Canada. Professor Gray is said to have found no region in this country richer botanically.

Not infrequently the way led through the edges of windfalls, the constant waste of an uncared-for forest, where between the fallen logs thickets of young trees were competing one another out of life, only a few of the sturdiest surviving to renew the old growth. In a primeval forest there is always nature's perfect balance of growth and decay.

After climbing for more than two hours through this hardwood forest, one realized not only its richness, but also its vast extent. Hundreds of thousands of acres stretched away through the mountains, unbroken except the clearings in the valleys—the last hardwood forest in the country as yet comparatively untouched by the lumbermen. As the slopes grew steeper the deep-rooted hardwoods gradually gave way to the shallow-rooted

spruces that find sustenance in the thin soil of swamps and high mountain slopes. We came into the great black belt of spruces that Big Tom said spread out for thirty miles unbroken, crowning these mountain tops. From them the range takes its name—the Black Mountains and Mount Mitchell is called the Great Black Dome. Going up through a tangle of low blueberry-bushes, we killed a rattlesnake that struck at the hind feet of the mule but fortunately missed them. The noise of a rattlesnake is strikingly like that of a baby's rattle, but never commonplace. Higher up, near the timber line, where the trees became scrubby from their struggle with the storms, fresh scratches of bears were seen on the bark of beech-trees. Still higher the trees became mere bushes, and the green cone of the mountain drew us on towards the summit.

At the top we looked out over the

wonderful succession of purple mountains stretching far into the dim evening light, or on the nearer red and green tops of Mount Clingman and the Seven Sisters, with the last rays of sunlight upon them-each, Tom said, as high as Mount Washington or higher, and he was right. The top of Mount Mitchell is the highest point between the Rocky Mountains, the Alps, and the Andes nearly a mile and a half straight up above the level of the sea. We found there the grave of Professor Mitchell, with its metal headstone, placed by his students many years ago, blown over by A few paces below this grave the wind. is a shelving rock that forms a cave. Here we spread our blankets on the dry rocky floor, with a fire at our feet, made from dry limbs that we carried up a few hundred feet.

Sleep was difficult. In that rare atmosphere the stars twinkled with twice or thrice their usual brilliance. Presently the moon, half-rimmed, spread a halo

over the neighboring peaks. Big Tom told the story of Professor Mitchell, teacher of chemistry at the University of North Carolina, whom he had found fifty-three years before, after eleven days' Mr. Mitchell had found and loved this mountain, and having a difference with Mr. Clingman, a lawyer of Raleigh, as to which was the higher. Mount Clingman or the Black Dome, he came over the mountain on his way to Big Tom's house, and, crossing a log over a chasm, slipped. Later Tom helped the students carry up the body and the headstone and place them on the very top—there, above our heads. Big Tom told of his having been drafted against his will into the Confederate Army and taken "into Kaintuck, where there warn't no water fit to drink." He said he had "jest cried for these here springs in these here mountings," and finally deserted and came home.

Then we talked about the clearings made in the mountains and the washing

SPRUCE AND RHODODENDRON

away of the clay soils, so that a farm became useless in one generation; of the steady rains for days together, the swollen streams and piles of rock spread over the fields below. He told of a mill and farm-house in another valley that had been washed away, and of another farm covered with rocks and débris so that it could not be used. This, he said, was the result of clearing. I learned afterwards that the annual rainfall in

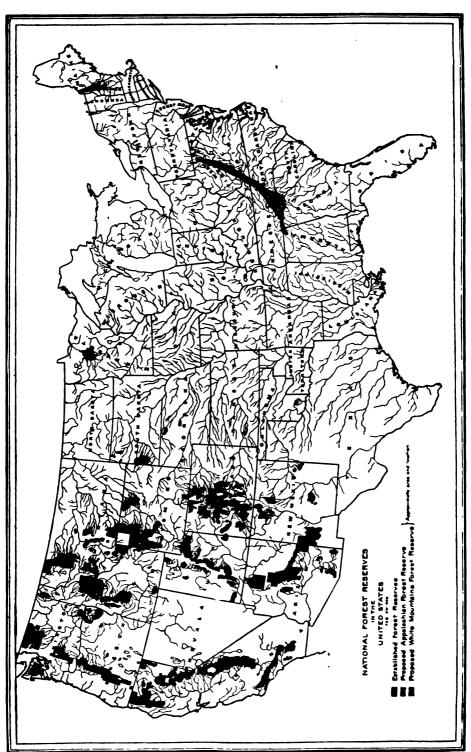

SPRUCE TREE TWO HUNDRED YEARS OLD KILLED BY FIRE

this region is seventy-three inches, the greatest in the United States except on the northern Pacific coast; that the clay soil quickly dissolves and washes away, and that in one year some seventeen million dollars' worth of property had been destroyed by the rivers that flow from these and neighboring mountains in Georgia, Tennessee, and Virginia, through nine important Southern States to the sea. Through the Kanawha, the Tennessee, and the Cumberland Rivers, clearings in this mountain region affect the flood waters in the Ohio and Mississippi. became convinced that these mountains. lying in parts of seven States, the Virginias, the Carolinas, Georgia, Tennessee, and Kentucky, can be controlled by none of them, nor is any adequate cooperative action possible in seven separate legislative bodies. The need of saving the timber and protecting the flow of streams can be met only by the Federal Government, and that promptly; for in this last great hardwood forest the lumbermen are operating every year on With the gradual exa larger scale. haustion of the forests in other parts of the country and the unprecedented rise in the price of timber, larger capital

brings in new methods to overcome the steep mountains swift. treacherous streams. The Federal Government alone has power to prevent the enormous expenditures that must come later in slowly reforesting these mountains if the present forests are once swept off.

The problems are the same in the White Mountain region, but further advanced. With the rapid growth of papermaking from spruce, thirty mill-

The fire burned away two feet and eight inches of soil ion dollars have been invested in mills and machinery in New Hampshire alone during the last fifteen years. Trees old and young, large and small, down to six inches in diameter, are used. On the high slopes where spruce grows unmixed with other species, and all of the trees are small, everything is cut, and those under six inches diameter (sometimes two-thirds of the standing forest) are left to rot upon the ground. the most wasteful and destructive method of lumbering that it is possible to imagine, practiced on the high slopes by all of the operating companies without exception. Fire follows almost invariably in the débris. As the soil on the mountains is largely vegetable mold, it also is consumed, so that the possibility of any forest growth of value is postponed from one to three centuries, and sometimes only the naked rocks remain. Eighty-four thousand acres in the White Mountain region were burned over in the single year 1903. About five thousand acres have been rendered completely and permanently barren. The great rivers of New England—the Androscoggin, the Saco, the Merrimack, and the Connecticut—rise in the White

Mountains and their immediate vicinity. They affect all of the New England States except Rhode Island, furnishing means of navigation, manufacturing power, and drinking-water to many cities.

But it is not the waterflow alone that makes these forests important. the young timber as well as the old is cut off, the resources of the future are wasted. When the forest disappears, the mills and wood-working factories disappear. A large population goes elsewhere, villages dwindle, and farms are abandoned. The middle and southern parts of New England have already suffered the loss of literally hundreds of millions of dollars in the complete exhaustion of the primeval white pine forests that were lumbered in the past without reference to the present, and northern New England is plunging forward on the same track.

One of my first experiences on coming into the White Mountains was an examination of the Randolph forest on the north slope of the Presidential Range. From the valley the whole sweep of this magnificent forest appealed to the eyetwelve miles long and four miles wide, stretching up to the snow-clad peaks, the interlocking spruces enfolding the mountains in a rich dark mass, broken only by the sharp, conical tops of the balsam firs, and at the lower edge by the intermingling gray tops of the hardwoods. At the distant upper edges the forest appeared to be patches of moss near the bold, rocky summits.

One cloudy Sunday afternoon in mid-November, at the invitation of Professor Edmands, who has constructed paths of even grade from Randolph to the tops of each high mountain, Madison, Adams, Jefferson, and Washington, I went with him to see some of the recent clearings. Entering the forests by one of the paths, we found spruce-trees two hundred and fifty years old and ninety feet tall. Mingled with the reddish scales of their tall shafts were the lighter gray trunks of the firs, covered with bubbles of resin-"the blister tree" was the Indian name-and the deeper furrowed bark of ancient hemlocks. Maples and curly-barked yellow birches were prominent, the whole making a close-ranked phalanx, ever

opening before us and closing in behind us, stretching silently upward, mysterious and full of life. Under foot the path was slippery with the brown new-fallen needles. Now and then we scurried through the dry leaves of the hardwoods. For an hour and a half we followed the path skirting the foot of Mount Adams. Here and there the forest varied, and we passed through a stand of beeches or a thick clump of firs. Whenever the wind had torn open the forest crown and felled the trees, thickets of hardwoods and young evergreens flourished in the unaccustomed light. Not one glimpse of the outside world came to us, so unbroken was the succession of tall stems.

We came at length upon the log camps, where fifty of the four hundred wood-choppers were sheltered. The cook was just taking from the "bean-hole" two smoking kettles, each holding a fragrant half-bushel that had been buried for a day and a half in the hot coals. The crew of French-Canadians were standing about, our presence offering the day's diversion.

We followed a lumber road for a little way in an effort to trace what had been the Israel Ridge path, but in vain. The path had been obliterated. For a mile and a half the search led through almost impenetrable tree-tops and débris, ending at length at the Cascade Brook, near the foot of the castellated ridge of Mount Jefferson. In this narrow ravine, where the sun shines but a few hours in the day, the trees were moss-covered and standing close. We mounted through them by a steep, rugged path, passing two of the seven waterfalls in this stream, climbing over rocks and many fallen tree-trunks. Nature fells trees also, but by the selective method, usually removing the mature and defective trees, keeping intact the productive power of the forest and the protective forest cover. Had we the wisdom to follow Nature's way, we should cease to slash young trees and old, thereby preventing any useful return from the forest for generations.

After a sharp climb of nearly two thousand feet, we came upon the Lookout, a birch-bark camp built around an out-of-doors fireplace in the side of the

Digitized by GOOGLE

FALLS ON THE PRESIDENTIAL RANGE, WHITE MOUNTAINS If the forest were removed, this would become alternately a torrent and dry, bare rocks

mountain. We found ourselves immediately under the edge of the clouds. Far out we saw the wide valley of the Ammonoosuc, dotted with houses and villages, surrounded by mountains, the steam of a distant train threading in and out among the settlements.

Pushing upward into the cloud, the character of the forest changed. Save the occasional white stem of a canoe birch dripping in the mist, there were only spruces and firs, as old as the trees below but much smaller, for on the high slopes there is but a brief growing season in the short, cold summer. A sharp climb of another thousand feet brought us beyond the line of commercial growth. Here the trees, most of them below six inches diameter, were ragged warriors that had fought the storms. Presently. at four thousand five hundred feet above the sea, the tree-stems, though as old as the giants at the base of the mountains, were no larger nor taller than a walkingstick, and massed so closely together that one can sit or lie down upon the top of this miniature forest without sinking to the ground.

A little higher the mist was freezing on the scrubby firs, and soon a pink glow gave promise of sunlight above. We hastened, and emerged at length The whole world was above the clouds. a mass of rolling white mist, save in the direction of the sun that made a wide path of gold. The rocky peaks of Jefferson and Madison rose on either side, with the steel-blue outline of Washington rising a thousand feet above. We climbed a path that led over the crest of Adams, to find shelter, if need be, in the stone hut of the Appalachian Mountain Club. The sun went down. Mount Washington deepened into sharper outline against the sky. The white clouds turned gray. Half a mile above us little fleecy cirrus clouds, like those of summer, floated in the sunlight. With much difficulty we made our way in the growing darkness over the frost-covered rocks, finding the low cairns that marked the way only by calling from one to the other.

A SPARSE FOREST GROWTH IN CALIFORNIA Such growth is good for protecting waterflow, but not for timber supply

Once over the crest we sat down to await the rising of the moon. It rose slowly, almost full, directly behind the conical peak of Mount Madison. Before us lay the Knife Edge—a high, narrow ridge of land dividing two deep ravines. We determined to follow a rocky trail along the top of it, leading to a wellmade path down the mountain. On the trail the little brook, far below, was sometimes heard. It flows through the Israel River and the Ammonoosuc into the Connecticut, turning many millwheels in New Hampshire, Vermont, and Massachusetts, and from Hartford bearing the steamers onward to Long Island Sound. The stream that was on the other side of us flows into the Peabody River and the Androscoggin, through the factory towns of Maine.

At the end of the long promontory we plunged down into the cloud and the gloom of the forest. Down in the darkness the tree-trunks disappeared from sight, and toward the base of the mountain so dense were the cloud and the

thick overhanging boughs of the evergreens that not one ray of light guided us; but we were able to make our way in the even path by feeling with our feet, reaching the settlement five hours after dark in the valley. The entire region of four square miles, where that path lay, is now an impenetrable mass of débris, having become a part of the clearing.

The unprecedented rise in the price of timber during the past few years, from twenty to one hundred per cent. according to species, is accounted for by the fact that, while the population of the country has increased three times, the total amount of timber consumed annually has increased ten times. We are using up the source of most of our houses, most of our paper, much of our fuel, and all of our furniture and wooden tools at a far more rapid rate than it grows. Conservative students of the problem admit that the end is in sight. Already fearful inroads have been made upon the hitherto primeval forests of the far West, which are truly magnificent in extent,

but yield quickly to modern methods of attack. By the terms of the iniquitous Timber and Stone Act the Government is obliged to se!l at the uniform price of two dollars and fifty cents per acre, though the value is often one hundred dollars per acre or more. Year after year an effort has been made to repeal this law, but so far a powerful lobby at Washington, backed by Western lumber companies, has prevented. A bill to repeal it is pending as I write, and should pass immediately in order that the remainder of the Nation's great heritage may be saved to the Nation and not given away. Much of the most valuable timber has been acquired already by large corporations.

On the other hand, a large portion of the Western land, like that in the State of Nevada, has a sparse growth, more suitable for the protection of rivers and their use in irrigation than for a permanent source of timber supply. Such forests and those of the high slopes of mountains should be cut only in the most conservative manner possible—and in private hands they never receive this treatment.

Under the wise policy followed by four Presidents, and fully approved by the country, large tracts of forest land in the West owned by the Federal Government have been set aside as forest reserves. These now include over one hundred million acres—a territory larger than New England. All of these reserves are west of the Mississippi River.

There should be reservations in the East, where the population is dense, where the sawmills and wood-working factories already established need material, and where the rivers, if not protected at their head-waters, will less effectively serve the tremendous interests dependent upon them. Particularly, reservations should be established, by Federal purchase, in the Southern Appalachian Mountains and in the White Mountains.

THE GOOD EARTH

BY CHARLES G. D. ROBERTS

The smell of burning weeds
Upon the twilight air;
The poignant call of frogs
From meadows wet and bare;

A presence in the wood And in my blood a stir, In all the ardent earth No failure or demur.

O Spring wind, sweet with love And tender with desire, Pour into veins of mine Your pure impassioned fire!

O waters, running free
With full, exultant song,
Give me, for outworn dream,
Life that is clean and strong!

O good earth, warm with youth, My childhood heart renew; Make me elate, sincere, Simple and glad, as you!

O springing things of green,
O winging things of bloom,
O winging things of air,
Your lordship now resume!

A COUNTRY THAT HAS USED UP ITS TREES

BY ELIOT BLACKWELDER

N one of his recent letters in The Outlook Mr. Kennan has described the desolate appearance of the coast of southern Manchuria—hills upon which neither tree nor shrub has been left, and where even the grass is all but destroyed each autumn. Other travelers have shown us that this condition is prevalent over a large part of eastern and northern China, and that it extends in varying degree over most of the Empire. In the western provinces, however, forests of considerable size may still be found in the recesses of the higher mountains. China, therefore, stands out pre-eminently as the land in which the process of forest destruction may be seen in all its stages, and where its natural effects may be observed. Here in the United States our forests are rapidly disappearing before the joint attacks of fires and the iumberman's ax. To Americans who realize this, and who have a desire to know what results are to be expected from a continuation of the process, China's experience will be interesting and significant.

The explanation of the dearth of forests in eastern China is to be sought in the mountainous region in the western part of the Empire. While crossing the broad Tsinling Range in the province of Shensi, we found remnants of once large forests of pine and spruce high up in the remoter gulches near the main divide. After months spent in crossing bare mountains and plains, it was a pleasure to walk once more on a carpet of pineneedles and hear the sound of the wind in the boughs. One thing became plain to us at that time—there is no inherent reason, except the human reason, why forests should not grow in northern China. Even in this remote region we were passed each day by lines of coolies, headed for the populous plains below, each carrying on his back a load of heavy boards. It may be well to explain that the mountain trails are too narrow and rough for carts or even for pack-animals. Most of the lumber is used in making coffins, and for this purpose it commands an enormous price; in the cities of the Weiho plain a single board retails at two or three dollars. It is not surprising that the constant drain upon the forests through all the centuries during which a dense population has inhabited that fertile plain has left only small remnants in these remote valleys. We can only wonder that all have not been destroyed. It is safe to say that with modern machinery and easy transportation an American or European company would in a few years cut off all of the trees that now remain in this district

The destruction of the trees is, however, only the first step in the process of total deforestation which was accomplished long ago in many parts of China, on a greater scale than in any other country. In our own land the forest is deemed of little value after all of the marketable trees have been cut off. The lumberman discards it and moves on to fresh fields of operation. Not so in China. When the trees are gone, they still have the saplings, shrubs, and lesser herbage; and no one knows better how to utilize every bit of the material than does the Chinese mountaineer. Poles for the support of roofs and for various other constructional purposes are made out of the larger shrubs, and the remainder is either sold for fuel directly. or is reduced to charcoal in the mountains and is thence carried down to the market towns, where it commands a good price. This reduction to charcoal has the great advantage of condensing values into small weight and space—a consideration of the greatest importance in

¹The illustrations in this article are from photographs by Mr. Bailey Willis, and used through the courtesy of the Carnegle Institution, Washington, D. C.

The mountains are bare and rickly ; their lower alones have been terraced to prevent further removal of soil. In the foreground lies a stream bed along which abrets of gravel are swept to time of floods. The abace to to has a period from this desoluting waste by low walls DEFORESTATION LONG COMPLETED

a region where all of the transportation is done by coolies, and where the original value of the product is duplicated about every five miles by the traffic charge. In the course of time the mountain slopes are thus divested not only of their trees, but also of the remaining undergrowth. For the forest there is substituted a grassy slope upon which thorny bushes are the only perennial herbage.

In a rugged region like the Tsinling mountains the difficulties in the way of complete deforestation are, however, too great to be overcome. To see the later stages of the process at their worst we must go to the lower mountains of northeastern China, especially those adjacent to the great plains upon which are crowded so many millions of the Chinese In other countries one's natural expectation to see the mountains more or less covered with forests is fulfilled; but as China is proverbially the antithesis of Western lands in many respects, so it is in this. In these eastern provinces one may travel hundreds of miles without seeing even a small grove of trees upon the hillsides; and I have never seen in that region anything deserving the name of a forest. Yet it must not be understood from this that the entire landscape is devoid of trees, for I am speaking only of the natural forest growths. their homes and villages the Chinese plant poplars and fruit-trees. Gravevards and temple courts contain twisted cedars which not infrequently are centuries old; but these trees are preserved through the force of public opinion, and he would be a bold man indeed who would dare cut a cedar from even a remote and untended graveyard. poplars belong to individual villagers, and are therefore protected as private property immediately under the eye of the owner. In hundreds of Chinese communities these poplars are the principal source of the timber which is used by the peasants; but the supply is so small that it hardly suffices for the barest necessities. Aside from such village groves the forest verdure, both great and small, has almost utterly disappeared. The process by which they were destroyed was completed at a time historically so remote that in some localities we found no traditions of its occurrence preserved among the inhabitants, while in other regions we were told that the trees had been cut off centuries ago.

Shantung is one of the provinces in which deforestation is practically complete, and here we see a sequel which is particularly interesting because it shows the length to which the thoughtless war on all vegetation can be carried in the absence of governmental regulation or of popular foresight and co-operation. refer to the annual forage after grass which takes place each autumn and winter. At this season all the boys of the village who are big enough to walk and carry a basket are sent out over the neighboring hillsides to collect grass, twigs, and, in short, any kind of herbage that can be used as fodder for the village cattle or as fuel. Each boy carries a basket and an iron grubbinghook fastened to a short wooden handle. Thus equipped, he clambers up the slopes, working away at his task with cheerful energy. The stronger boys reach even the highest summits, and so through the industry of this army of human locusts the mountains are almost denuded of the dry annual herbage.

These foragers do not quite complete the devastation; they are usually followed by shepherds, whose flocks of sheep and goats search each ledge and crevice and crop the remaining grass down to its very roots. Any one who has crossed the path of a band of sheep in our own Western mountains knows that the final result of their depredations is a surface almost as barren as if it had been swept by fire.

Some of the effects of this complex process of deforestation will be apparent to the reader at first glance. As timber becomes scarce, prices rise and the use of it must be correspondingly curtailed. Houses can no longer be built of wood, but as a substitute bricks and mud are necessarily adopted by the common people. The prices of the better grades of lumber for all purposes become almost prohibitive, so that in making carts, furniture, implements, and, in short, almost everything in his trade, the village carpenter must be content with the softer

MOUNTAINS OF SOUTHERN SHENSI

An example of partial deforestation. Slopes partly denuded
of trees and shrubs, but still covered with a thick soil

and cheaper woods, such as those of the poplar and willow. With the passing of the forests comes the extermination also of the useful herbs and game which in other countries enhance the value of the timbered regions.

But, important as these considerations may seem, they sink into insignificance beside the indirect and less obvious results which have followed the deforestation of northern China. These results may be grouped together as those which relate to the water supply of the country and those which affect the soils.

In any country most of the water which falls upon the land is disposed of in three ways, viz., by evaporation from the surface, by running off into the streams, or by percolating into the earth. The ratio between these portions is a matter of great moment to any community, and especially to one which depends for its support largely upon agriculture. In the ordinary climates of the temperate zone evaporation (including transpiration through plants) is a matter of secondary consequence, and in this brief sketch we may neglect it. It must be noted, how-

A STREAM BED IN THE DEFORESTED REGION

Entirely dry except in time of rain. The breadth of the channel has been determined by occasional violent floods, descending from the mountains in the distance

ever, that the run-off and the percolation are vital.

In the mountains of western China, where the destruction of the forests is still in its earlier stages, the rains are caught by the spongy mass of grass, mosses, and leaf-mold which forms the thick carpet of every woodland. The stems and roots hinder the flow of water which gathers upon the surface in time of rain and allow the greater part of it to sink into the earth. This water saturates the soil and the underlying rocks, and moves slowly but surely toward

some exit at a lower level, meanwhile keeping the ground moist even within a few inches of the surface. The advantage of this to all forms of plant life is obvious. Furthermore, springs are numerous in such a region, and since the upper limit of this body of subterranean water is relatively near the surface, plenty of water may be obtained from shallow wells. In such a region there are many streams which flow steadily throughout the year.

Among the devastated hills of eastern China conditions are very different.

TERRACED FIELDS IN SHENSI
The lone tree on the left guards a wayside shrine, and is therefore not molested. All other vegetation has been cut off

There are neither trees, shrubs, nor even thick grass to restrain the water which falls in time of rain. The water descends upon a comparatively bare surface, and as it runs quickly off over the slopes only a small proportion of it sinks into crevices or porous places in the soil, while a much greater part becomes concentrated in the numerous gullies and rushes down to the valleys below. The inevitable result is a flood, corresponding in its severity to the magnitude of the storm. It may tear out the flimsy bridges which the Chinese build, spoil the low-lying fields, and even devastate towns and villages. Within a few hours after the flood has passed the main stream dwindles to its normal size again, or perhaps disappears entirely, but the damage has been done and is sure to be repeated. The water which percolated into the soil is insufficient to maintain the level of underground water near the surface; it has in fact sunk so low that springs are rare and the smaller valleys are merely dry arroyos except in time of On account of this lowering of the underground water level there is not sufficient moisture in the soil to supply any plants except those which are adapted to dry conditions. Where possible, the farmers resort to irrigation, obtaining the water from wells and canals largely by means of rude pumps; but much of the land is not suitably located for such treatment, and a large area of the uplands must therefore be planted with crops such as wheat and millet, which require but little water. By thus disturbing the natural ratio between the water which runs off into the streams and that which sinks into the ground, the Chinese have unwittingly brought on two great misfortunes, viz., frequent disastrous floods and a reduction of the available water supply.

The second group of results—those relating to the changes in the soil itself and in its distribution—bring with them evils no less important. Soil which is covered with vegetation is held securely in place by the interlacing roots, and is protected from the beating rain by the leaves and branches overhead. Even in the severest storms the water which runs off over the surface is so retarded by the

matted growth of plants that its power to wear away the soil thus bound down is reduced to a minimum. On this account the downward movement of the soil on forest-clad slopes, even if the latter are steep, is exceedingly slowprobably not more rapid than the renewal of the soil by the decay of the underlying rock. Where this protective covering has been removed, however, as in the mountains of eastern China, the wash of the soil from all sloping surfaces is relatively rapid. Ramifying systems of gullies develop at the edges of the slopes, and each succeeding shower causes them to eat their way, as it were, back into the loose material; their advance is so speedy that it can be readily observed even in the brief space of a human lifetime. Each rain washes down from the higher points the dust and sand which have been loosened by the plants, frost, and other agencies, so that as time goes on less and less soil remains on the slopes, while more and more is spread out upon the flats which border the streams. An enormous quantity is annually carried out to sea as mud by the Yellow River and its equally turbid neighbors. Recognizing this tendency of the soil to wash down into the valleys. the natives have developed ingenious systems of terraces to check the process and take advantage of it so far as it has benefits. A low stone wall is first built parallel to the base of the slope, and all the available soil is scraped down into the reservoir thus formed; the thin earth, for a distance of some yards up the hillside, is then thoroughly loosened with a stout hoe, so that the next few rains may wash it down, and deposit it just above the stone wall. By this means a narrow, flat field or terrace is soon formed. Other walls are then placed in succession above the first, and the same process is repeated in each case. This device of terracing the slopes has two advantages. It not only retards the wash of the soil, but, more important still from the Chinese point of view, it renders a much larger area of the hillsides available for cultivation. And yet the practice is applicable only to the lower and gentler slopes. The summits and steep sides of the mountains are soon divested

of the soil which formerly supported their forests, and now they remain bare and rocky. In such a country the reforestation of the mountain heights would be a very difficult undertaking, and would require scores of years. A new soil would have to be formed by the slow processes of decay before any considerable growth of trees could be expected.

As the rain descends over unprotected slopes it not only carries off the soil and produces floods, but it has a permanently deleterious effect upon the broad flats which form the floors of the valleys. In most countries the so-called "river bottoms" are among the richest agricultural lands. This is true also in China, but the statement can be applied only to the lower reaches of the rivers which meander sluggishly through broad plains. Among the hills the valleys which were once fertile have been partially ruined since the forests were A stream which is capable, destroyed. at its normal stage, of handling nothing coarser than mud and silt, may in floodtime sweep along sheets of sand, gravel, and often small boulders. As the river rises and overflows its banks, this rough material is strewn over the adjacent bottom-lands and renders them worthless for farming purposes; from that time on they remain a barren, gravelly waste. Damage of this kind is of course practically irreparable.

Every one who goes to China, or who reads much about it, is early impressed with the severity of the dust storms which are so annoying in winter throughout the northern provinces. Some of the foreign residents have a theory that such storms descend upon them from the deserts of Mongolia; but as a matter of fact it is not necessary to go outside one's immediate vicinity to find ample explanation for them. Every strong wind stirs up the dust and soon fills the air with an impalpable brown powder which makes its way through all cracks and crevices, into eyes and throats, and dims the sunlight on a cloudless day.

So fine are the particles that they remain suspended in the air for hours, so that it often requires a day or two for the dust to settle out of the atmosphere and leave it fit to breathe again. This is only another of the effects of destroying all herbage, both perennial and annual. In our own country the grass holds down the dry soil, and the trees tend to act as sieves to remove the suspended particles from each passing wind. We, therefore, have little to complain of from dust except along highways and in our cities. But in China the mountain slopes are bare and after the harvest is gathered the fields are completely denuded. entire land surface then becomes a source of dust. With these facts in mind, the explanation of the dust storm is not far to seek. Could the trees be restored to the hillsides, the grass to the plains, and the stubble to the fields, the phenomenon would largely disappear.

There is nothing peculiar or exceptional in China's experience, except that the process has gone further there than in most countries. It will be repeated in any land where adequate precautions are not taken to preserve the forests. In America we still have extensive forests, and by judicious use we may save them and even increase the area which they cover. In a recent issue of the "National Geographic Magazine" Mr. Gifford Pinchot points out that in colonial and pioneer days the forest was a foe and an obstacle to the settler. had to be cleared away to make room for fields and villages, and it harbored hostile Indians and wild beasts with which the early American had to contend. That condition has now largely passed away, but as a nation we have not yet come to have a proper respect for the forest and to regard it as an indispensable part of our resources—one which is easily destroyed but difficult to replace; one which confers great benefits while it endures, but whose disappearance is accompanied by a train of evil consequences not readily foreseen and positively irreparable.

A FOOLS' PARADISE

BY ARTHUR H. SMITH

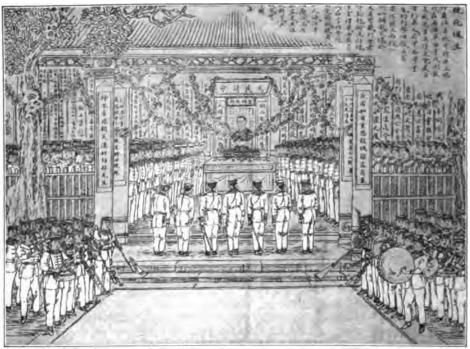

Author of "Chinese Characteristics," "Village Life in China," "China in Convulsion," etc.

T is a mere commonplace that since the universal adoption of steam and electricity commerce is king. There is no nation, no people, which does not own his sway. Philanthropists are not without hope that, despite all apparent facts to the contrary, the time is not remote when war, as we now know it, will be, if not impossible, at least rare and exceptional. But just in proportion as this millennium of peace dawns upon us, we may expect that commercial war, the struggle to supply the world's demands, will become keener, more relentless, and more general until it is universal. In this competition the United States of America holds a strong position. We have the larger part of a continent to ourselves, almost unvexed by the presence of troublesome neighbors; we are not obliged to keep a large standing army; we do not fear invasion; and with a strong navy we may possess our souls in peace and tranquillity. Our territories stretch from ocean to ocean. We have every variety of soil, climate, and production; as has often been pointed out, we have long since established an uncontested agricultural supremacy. "With five per cent. of the world's population we produce thirty-two per cent. of the world's food supply." We furnish three-fourths of the world's cotton. We provide more mineral oil than any other land. We are the largest producers of iron and steel in the world. We have a population which is gifted with a restless productive activity elsewhere unequaled. "Mulhall estimates the energy of the United States at 129,-360,000,000 foot-tons a day—nearly as much as that of Britain, Germany, and France combined "—and he says: " If we take a survey of mankind in ancient and modern times as regards the physical, mechanical, and intellectual force of nations, we find nothing to compare with the United States." Professor von

Schierbrand, from whose informing work entitled "America, Asia, and the Pacific " some of the foregoing remarks are quoted, enumerates as the foundations on which American manufacturing supremacy rests, the following particulars: (1) An abundance of cheap coal of good quality. (2) Cheap and abundant iron of good quality. (3) Low labor cost, so that in spite of an average weekly wage of \$15 for an American operator as against \$4 for the German, the American employer is still ahead because, on account of better climate, surroundings, diet, and quicker brain execution, the American output is much larger. (4) American machinery is better. (5) American ingenuity and inventiveness are unequaled. "The best available statistics show that the productive energy of each inhabitant of the United States is 1,940 foot-tons daily, while in Europe it is only 990 foot-tons. This means that 75,000,000 Americans are achieving as much in useful labor as 150,000,000 Europeans. In some branches of labor the difference is even greater. The American farm laborer produces four times as much foodstuff as does the average European farm laborer." (6) A practically inexhaustible supply of cheap raw material. (7) Easy access to markets. We are between Europe and Africa on the east, and Asia and Australia on the west. Of these advantages it is pointed out that all but the fourth are permanent and unalienable. Add to these the wonderful expansion which is as certain to follow the opening of the Panama Canal as night to succeed day. This waterway will effect a saving for ships passing through it from five thousand to eight thousand miles. London will be brought nearer to San Francisco by more than seven thousand miles. The shortening of distance between New York, our great eastern port, and San Francisco, our greatest western

port, will be more than ten thousand miles. The Mississippi Valley—the most important valley in the world—will have a new outlet. Existing commerce will be greatly expanded; new commerce will be created; the Hawaiian Islands will then become in fact what a few have always perceived them potentially to be, at once the key and the crossroads of the Pacific. By the multiplication of the means of communication

earliest history the world has contended. For convenience we may refer to an address by the Hon. O. P. Austin, Chief of the Bureau of Statistics, to the National Geographic Society (of which he is Secretary), which is published in the September (1905) number of the "National Geographic Magazine." The ever-expanding West has struggled for the control of the commerce of the East, threading difficult mountain passes, crossing

WORSHIPING THE SPIRIT OF THE ORIGINATOR OF THE BOYCOTT

This young man was unknown a year ago. His suicide was intended to embroil America and China. Students worship his manes, with girl students near by (a new feature in Chinese life) abetting. He bids fair to evolve into a god of Patriotism. This illustration and the others on following pages are from cartoons published in Chinese papers.

America is now brought near to every other country.

"The world is all our neighbor; The stars are foreign lands."

The Far East, which but lately was ten thousand miles distant, is now close at hand. If we include under that term the Indian, the Chinese, and the Japanese Empires, we have practically one-half the population of the globe who are in process of transition and even transformation to a degree very little apprehended by Americans. It has often been pointed out that the commerce of the Orient is a prize for which from its

desert wastes, and later braving unknown oceans to get access to the Orient. Beginning with caravans from the Nile valley to the valley of the Euphrates, to India, and to China almost in prehistoric times, we come to the modern period when great sea routes were first discovered and then declared the common property of mankind under the growing law of nations.

Without pausing to trace the history of this development, it is important to note that within the past generation, owing to improvement in the means of communication and of transit, it has

entered upon an entirely new stage. A hundred years ago "the world had not a single steamer upon the ocean, a single mile of railway on land, a single span of telegraph upon the continent, or a foot of cable beneath the ocean. In 1905 it had over eighteen thousand steam vessels, five hundred thousand miles of railway, and more than a million miles of land telegraph; while the very continents are bound together and give instantaneous

hundred and fifty millions, as against seven hundred and fifty millions for all the rest of the globe, with a land area of but little more than one-third of the globe (eighteen million square miles against thirty-four million square miles for the remainder). Yet Oriental commerce totals less than three billion dollars, while that of the rest of the world is nineteen billions—an average commerce in the Orient of about three dollars per

BOYCOTTING A SHOP THAT SELLS AMERICAN FLOUR

American flour is whiter, cleaner, and cheaper than that made in South China. Its sale has been enormous. Now the mills in Washington are shutting down for lack of a market. He who uses American flour is unpatriotic and will be boycotted.

communication by more than two hundred thousand miles of ocean cable." By this enormous increase in the power of production, transportation, and communication, commerce in all parts of the world has multiplied, is multiplying, and will multiply many fold.

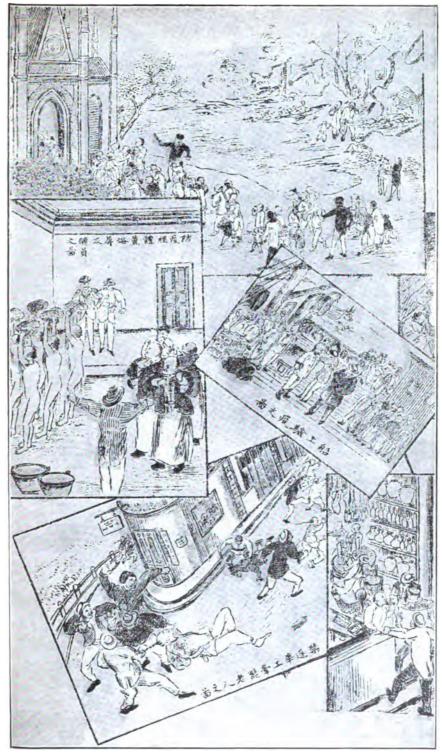

"The world's international commerce, which a single century ago was less than two billions of dollars, is now twenty-two billions; and the commerce of the Orient, which was less than two hundred millions, is now nearly three thousand millions." The population of Asia and Oceania is estimated at eight

capita against twenty-seven dollars for the remainder of the world. The growth of Oriental trade for a century has been but two billions of dollars, as against eighteen billions in other parts of the world. But this period of comparative stagnation is passing away. During the past half-century India has built about twenty-eight thousand miles of railway, and has a trade of about \$2.25 per capita, while little Japan, with about four thousand five hundred miles of railway, has a trade of \$5.86 per head. The industrial revolution in the latter country is one of the marvels of our

In China, on the other hand, with a population ten times that of Japan, commercial and industrial changes are but beginning. With only about two thousand miles of Chinese railway, experience since 1900 has shown the most conservative Chinese that here is an Aladdin's lamp which they have but to rub to produce a wealth beyond the dreams of even Oriental avarice. The line from Peking to Newchwang is supposed, during the past year, to have netted the Chinese Government between three and four hundred thousand dollars (silver) per month. Is it strange that Chinese geomancy (fengshui) practically disappears as an inhibitory force, and that the dreaded Earth Dragon crawls down a little deeper to be out of the way of the rumble of trains and the piercing of mining shafts? The new industrial China will involve one of the mightiest transformations in the history of mankind-hundreds of millions of sturdy agriculturists metamorphosed into manufacturers. The great plain of China produces unlimited cotton. Its teeming population are all potential agents by which steam and electricity will revolutionize the empire of the East. of Hankow, on the mighty Yangtzu River, is probably destined to become one of the greatest manufacturing centers of the world. To control this unprecedented development, and to have a share in its potentialities, is the ambition of every trading country. As we have already reminded ourselves, on the ground of capacity, proximity, energy, we are the people who ought to enter into the new conditions with the greatest advantages. Since 1898 the balance of trade is in our favor. China has a long list of commodities—tea, silk, hemp, jute, etc.—that we must have. We have cotton goods, lumber, kerosene, flour, etc., which the Chinese have come to like, upon which, however, they are not dependent. We are reminded by the great and growing emigration of some of our best agriculturists to Canada that our arable land is practically exhausted. Hitherto the world has gone westward; but now the limits have been reached, and we must go technically West to get to our goal, which must be the Far East. Mr. Carroll

D. Wright has repeatedly pointed out that our unceasing production always tends to become over-production. We are perpetually snowed under by our own products, which must be exported somewhere, but for which, practically, we must find a market in the Far East. "To raise the standard of the Chinese people one hundred per cent.," says Dr. Josiah Strong, "is equivalent to the discovery of five new Americas at a time when there are no more lands to be discovered."

Now, what are we Americans doing in the face of possibilities and necessities like these? We need a large American mercantile marine. At present the "flowery flag" has almost disappeared from Chinese seas, while every other country, Great Britain, France, Germany, Russia, and Japan, is represented by great steam lines traversing the globe. The Japanese "Nippon Kaisha" is said to be second only to the Peninsular and Oriental Company in the number of its steamers and their tonnage. They run to Vancouver, Seattle, San Francisco, Australia, Shanghai, Hongkong, the Straits Settlements, London. What have we worthy to be mentioned in the same generation with this growth of yesterday? Where are our American banks in the Far East to match the gigantic aggregations of capital of the countries named, which are really commercial arteries and veins through which strong financial currents steadily ebb and flow? When shall we have our Consular Service so reformed that we may not, as now, stumble upon many admirable men (with some flagrant exceptions), all greatly underpaid, but may be sure of the best men that the country affords in positions of delicacy, difficulty, and of high importance? When shall we have a class of American business men who go, as Germans do, to Eastern lands to learn the language, to cultivate the people, to develop trade and friendship with the Orient, and to take a practical part in the greatest movement of modern times to their own advantage and to that of America and the East? At present what we witness is: (1) "A vast and varied ignorance" on the part of even shrewd and theoretically well-informed business

ILL-TREATMENT OF CHINESE AT SAN FRANCISCO

American insolence in the indiscriminate confounding of scholars, merchants, travelers, and coolies, by treating them as alialize actual or potential criminals, has sunk deep into the awakening national consciousness. Nothing could be better adapted to inflame hatred than these pictures. They show Chinese being driven into the detention sheds, compelled to bathe, measured by the Bertillon system, and subjected to violence and indignities in the street.

men of America as to existing conditions and an indifference to them which makes a handsome match for the like feeling on the part of the Chinese. (2) A race prejudice against those of other training and different skins from our own which is amusing, amazing, inexcusable, and idiotic. Nothing like it, so far as we know, is met with in any of the commercial nations of Europe. In the keen competition for trade it is a heavy weight and an almost fatal handicap. (3) A brainless optimism which, like the traditional midnight cat on the wall, felicitates itself that "things seem to be coming my way" when the facts, rationally considered, are to be interpreted quite other-There is a series of contemporaneous phenomena to which we are singularly indifferent called "the Germanization of the world," which will affect us most seriously both at home and abroad; and there is another process going on which is rightly termed "the Japanization of the Far East," of which we know nothing and for which we care nothing; and yet these allied and yet totally distinct forces harmonize in their endeavor to shut us out of Asia. are doing what we can to assist them by our selfish and indeed brutal treatment of the Chinese, extending through many decades, which we have conveniently forgotten, but which now, since four hundred millions are coming to worldconsciousness, they inconveniently remember. We have invited them to our shores, hunted them as criminals for their accursed sobriety, industry, and economy, have refused justice for wholesale murders committed in "a Territory," because that is a loosely organized region over which the Government control is slight, and for like murders committed in "a State," because that is a tract highly organized, over which the Government has no control at all! Is it any wonder that when a Secretary of State referred the Chinese Minister to the Governor of Colorado, the Oriental blandly replied that he had " no treaty with the Governor of Colorado"?

The nidus of the boycott is in the accumulation of the wrongs of many years, of our mistreatment of an ancient, a proud, a sensitive, and a learned people by a Nation that once professed to believe that "all mankind are created free and equal." This is aggravated by the shameful betrayal of American interests in the Hankow-Canton Railway by an American syndicate. The Chinese are now united against us as never before. Those who know tell us that our trade is becoming a vanishing quantity. The lives of all Americans in China are in more or less danger; yet most of us continue, in the language of a German proverb, to "hold our mouths open, expecting roasted pigeons to fly inside." Is it too much to say that the American people as a whole are living in a fools' paradise?

THE ODOR OF THE OINTMENT

BY ZONA GALE

SCENSION' lilies were everywhere in our shabby drawingroom. They crowded two tables and filled a corner, and rose, slim and white, atop an old Sheraton cabinet. Every one had sent Peleas and me a sheaf of the white blooms—the Cleatams and the Chartres, Miss Willie Lillieblade and Enid and Lisa and Hobart Eddy, had all remembered us on Easter eve, and we entered our drawing-room after breakfast on Easter morning to be almost greeted with a winding of the silver trumpets. The sun smote gloriously across them, and some were like a heavenly kind of candle, their light secretly diffused, premonitory of spring, of some far-off resurrection of light itself into a newer, sweeter element. It was a wonderful Easter day, and, in spite of our absurd white hair, Peleas and I were never in fairer health; and yet, for the first time in our forty-eight years together, Easter found us close prisoners. Easter morning, and we were forbidden to leave the house!

Peleas walked to the window, and lifted and touched among the blossoms, and shook his head sadly.

"Ettare," he said, with some show of firmness, "there is no reason in the world why we should not go."

"Ah, well now," said I, with a sigh, "prove that to Nichola. Do I not know it perfectly already?"

It is one sign of our advancing years, we must suppose, that we are prone to blame each other for the trifles that heaven sends. The sterner things we long ago learned to accept with our hands clasped in each other's; but when the postman is late, or the hot water is cold, or the gas is poor, we have a way of looking solemnly sidewise, with our souls tried.

Yet the night before we had gone upstairs in the best of humors, Peleas carrying an Ascension lily to stand in the moonlight of our window—for it always seems to me the saddest injustice to set

the sullen extinguisher of lowered lights upon the brief life of a flower. And we had looked forward happily to the hallowed hour of the morning when the service is, as it should always be, inseparable from a festival of spring.

Then, lo! when we were awakened there was the treacherous world one glittering coat of ice. Branches sparkled against the sparkling blue, the wall of the park was a long rampart of silver, and the faithless sidewalks were mockeries of slipperiness. But the sad significance of this did not come to me until Nichola entered the dining-room with the griddle-cakes and found me dressed in my gray silk and Peleas in broadcloth.

"Is it," said our old serving-woman, who ruled us as if she had brought us from Italy, and we had not, forty-odd years ago, tempted her from her native Capri, "is it that you are mad, with this ice everywhere, everywhere?"

"It is Easter morning, Nichola," said I, with the mildness of one who supports a perfect cause.

"Our Lady knows it is so," said Nichola, setting down her smoking burden; "but the streets are so thick with ice that one breaks one's head a thousand times. You must not think of so much as stepping in the ar-y."

She left the room, and the honey-gold cakes cooled while Peleas and I looked at each other, aghast. Miss our Easter service for the first time in our life together! The thought was hardly to be borne. We argued it out with Nichola when she came back, and Peleas even stamped his foot under the table; but she only brought more cakes and shook her head—the impertinent old woman who has conceived that she must take care of us.

"One breaks one's head a thousand times," she repeated, obstinately. "Our Lady would not wish it. Danger is not holy."

To tell the truth, as Peleas and I

looked sorrowfully out the window over the Ascension lilies, we knew that there was reason in the situation, for the streets were perilous even to look at the less we bitterly resented it, for it is bad enough to have a disagreeable matter occur without having reason on its As for our carriage, that went side too. long ago, together with the days when Peleas could model and I could write so that a few were deceived; and as for a cab to our far downtown church and back, that was not to be considered. For several years now we have stepped, as Nichola would say, softly, softly from one security to the next, so that we need not give up our house; and even now we are seldom sure that one month's comfort will keep its troth with the next. Since it was too icy to walk to the car, we must needs remain where we were.

"I suppose," said I, as if it were a matter of opinion, "that it is really Easter uptown too. But some way—"

"I know," said Peleas. Really, of all the pleasures of this world, I think that the "I know" of Peleas in answer to something I have left unsaid is the last to be foregone. I hope that there is no one who does not have this delight.

"Peleas—" I began tremblingly to

"Ah, well now," cried Peleas, resolutely, "let us go anyway. We can walk beside the curb slowly. And, after all, we do not belong to Nichola." Really, of all the pleasures of this world, I think that the daring of Peleas at moments when I am cowardly is quite the last to be renounced. I hope that there is no one who has not the delight of living near some one a bit braver than one is one's self.

With one accord we guiltily slipped from the drawing-room and toiled up the stairs. I think, although we would not for the world have said so, that there may have been in both our minds the fear that this might be our last Easter together, and if it were, to run away to Easter service would be a fitting memory, a little delicious human thing to remember among austerer glories. Out of its box in a twinkling came my violet bonnet, and I hardly so much as looked in a mirror as I put it on. I fastened

my cloak wrong from top to bottom and seized two right-hand gloves and thrust them in my muff. And then we opened the door and listened. There was not a sound in the house. We ventured into the passage and down the stairs, and I think we did not breathe until the outer door closed softly upon us. For Nichola, we have come to believe, is a mystic, and thinks other people's thoughts. At all events, she finds us out so often that we prefer to theorize that it is her penetration and not our clumsiness that betrays us.

Nichola had already cleaned the steps with hot water and salt and ashes and sawdust combined—Nichola is so thorough that I am astonished that she has not corrupted me with the quality. Yet no sooner was I beyond the pale of her friendly care than I overestimated thoroughness, like the weak character that I am, and wished that the whole street had practiced it. I took three steps on that icy surface and stood still, desperately.

"Peleas," I said, weakly, "I feel—I feel like a little nut on top of a big, frosted, indigestible cake."

I laughed a bit hysterically, and Peleas slipped my arm more firmly in his, and we crept forward, like the hands of a clock, Peleas a little the faster, as became the tall minute hand. We turned the corner safely, and had only one interminable block to traverse before we reached the haven of the car. I looked down that long expanse of slippery gray, unbroken save where a divine janitor or two had interposed, and my courage failed me. And Peleas rashly ventured on advice.

"You walk too stiffly, Ettare," he explained. "Relax, relax! Step along slowly but easily, as I do. Then, if you fall, you fall like a child—no jar, no shock, no broken bones. Now relax—"

And Peleas did. Before I could shape my answer Peleas had relaxed. He lay in a limp little heap on the ice beside me, and I shall never forget my moment of despair.

I do not know where she came from, but while I stood there hopelessly reiterating, "Peleas—why, Peleas!" on the verge of tears, she stepped from some door of the air to my assistance. She wore a little crimson hat and a crimson collar, but her poor coat, I afterward noted, was sadly worn. A the moment of her coming it was her clear, pale face that fixed itself in my grateful memory. She darted forward, stepped down from the curb, and held out two hands to Peleas.

"Oh, sir," she said, "I can help you. I have on rubber boots."

Surely, no interfering goddess ever arrived in a more practical frame of mind.

When Peleas was upon his feet, looking about him in a dazed and somewhat unforgiving fashion, the little maid caught off her crimson muffler and brushed his coat. And Peleas, with bared head, made her as courtly a bow as his foothold permitted as she was standing somewhat shyly before us with the prettiest anxiety on her face, shaking the snow from the crimson muffler.

"You are not hurt, sir?" she asked, and seemed so vastly relieved at his reassurance that she quite won our hearts. "Now," she said, "won't you let me walk with you? My rubber boots will do for all three."

We each accepted her arm without the smallest protest. I will hazard that no shipwrecked sailor ever inquired of the rescuing sail whether he were inconveniencing it. Once safely aboard, however, and well under way, he may have symbolized his breeding to the extent of offering a faint, polite resistance.

As "Shall we not be putting you out?" inquired Peleas, never offering to release her arm.

And "I'm afraid we are," I'ventured, pressing to her all the closer. She was frail as I, too, and it was not the rubber boots to which I pinned my faith; she was young, and you can hardly know what safety that bespeaks until you are seventy, on ice.

"It's just around the corner," informed Peleas, apologetically, and for the first time I perceived that, by common consent, we had turned back toward home. But neither of us mentioned that.

Then, while we stepped forward with beautiful nicety, rounding the corner to come upon the avenue, suddenly, without a moment's warning, our blackest fears were fulfilled. We ran full upon Nichola.

"Ah, I told you, Peleas!" I murmured; which I had not, but one has to take some comfort in crises.

Without a word Nichola wheeled solemnly, grasped my other arm, and made herself fourth in our singular party. Her gray head was unprotected, and her hair stood out all about it. She had thrown her apron about her shoulders, and great patches in her print gown were visible to all the world. When Nichola's sleeves wear out, she always cuts a piece from the front breadth of her skirt to refurbish them, trusting to her aprons to conceal the deficit. She was a sorry old figure, indeed, out there on the avenue in the Easter sunshine, and I inclined bitterly to resent her interference.

"Nichola," said I, haughtily, "one would think that we were obliged to be wheeled about on casters."

Nichola made but brief reply.

"Our Lady knows you'd be better so," she said.

So that was how, on Easter morning, with the bells pealing like a softer silver across the silver of the glittering city, Peleas and I found ourselves back in our lonely drawing-room considerably shaken and hovering before the fire which Nichola stirred into a leaping And with us, since we had so insisted upon her coming, was our new little friend, fluttering about us with the prettiest concern, taking away my cloak, untying my bonnet, and wheeling an armchair for Peleas, quite as if she were the responsible little hostess and we her upset guests. And presently, the bright hat and worn coat laid aside, she sat on a hassock before the blaze and looked up at us in her delicious shyness, like a little finch that had alighted at our casement and had been coaxed within. I think that I love best these little birdwomen whom one expects at any moment to hear thrilling with a lilt of unreason-

"My dear," said I, upon a sudden, "how selfish of us! I dare say you will have been going to church?"

She hesitated briefly.

"I might 'a' gone to the mission," she

explained, unaccountably coloring, "but I don't know if I would. On Easter."

"But I would have thought," I cried, "that this is the day of days to go."

"It would be," she assented, "it would be—" she went on, hesitating, "but, ma'am, I can't bear to go," she burst out, "because they don't have no flowers. We go to the mission," she added, "and not to the grand churches. And it seems—it seems—don't you think God must be where the most flowers are? An' last Easter we only had one geranium."

Bless the child! I dare say I must be a kind of pagan, for I understood.

"Your flowers are beau-tiful," she said, shyly, with a little breath of content. "Are they real? I've been wantin' to ask you. I never saw so many without the glass in front. But they don't smell much," she added, wistfully; "I wonder why that is?"

Peleas and I had been wondering that very morning. They looked so sweet-scented and yet were barren of fragrance; and we had told ourselves that they were, perhaps, lilies of symbol, without mission or message beyond the symbol, without hue or passion, or, so to say, experience.

"Perhaps if one were to make some one happy with them, or to put them in a bride's bouquet, they would no longer be scentless," Peleas quaintly said.

But now my mind was busy with other problems than those of such fragrance.

"Where do you go to church, my dear?" I asked, gravely, not daring to glance at Peleas.

"To the mission," she said, "over—" and she named one of the poorest and most struggling of the East Side chapels. "It's just started," she explained, "an' the lady that give most, she died, and the money don't come. And poor Mr. Lovelow, he's the minister, and he's sick—but he preaches, anyhow. And pretty near nobody comes to hear him," she added, with a curious, half-defiant emotion, her cheeks still glowing. It was strange that I, who am such a busybody of romance, was so slow in comprehending that betraying color.

Peleas and I knew where the mission was. We had even peeped into it one

Sunday when, though it was not quite finished, they were trying to hold service from the unpainted pulpit. I remembered the ugly walls, covered with the lead-pencil calculations of the builders, the forlorn reed organ, the pushing feet upon the floor. And now "the lady who give most" had died.

"Last Easter," our little friend was reiterating, "we had one geranium that the minister brought. But now his mother is dead, and I guess he won't be keeping plants. Men always lets 'em freeze. Mis' Sledge, she's got a cactus, but it hasn't bloomed yet. Maybe she'll take And they said they was going to hang up the letters left from last Christmas, for the green. They don't say nothing but 'Welcome' and 'Star of Bethlehem,' but I s'pose the 'Welcome' is always nice for a church, and I s'pose the star shines all year round, for that matter. But they don't much of anybody come. Mr. Lovelow, he's too sick to visit round much. Last Sunday they was only 'leven in the whole room.'

"Only 'leven in the whole room." hardly seemed credible in New York. Yet I knew the poverty of some of the smaller missions, especially in a case where "the lady that give most" has died. And this poor young minister, this young Mr. Lovelow whose mother had died, and who was too sick to "visit round much," and doubtless had an indifferent, poverty-ridden parish which no other minister wanted-I knew the whole story of the struggle in an instant. I looked over at our great banks of Ascension lilies and I found myself most unreasonably angry with the dear Cleatams and Chartres and the rest for the selfindulgence of having given them to us !

At that moment my eyes met those of Peleas. He was leaning forward looking at me with his adorable expression of both daring and fear of my disapproval, and I saw his eyes go swiftly to the lilies. What was he contriving, I wondered, my heart beating. He was surely not thinking of sending our lilies over to the mission, for we could never get them all there in time, and Nichola—

"Ettare!" said Peleas—and showed me in a moment heights of resourcefulness to which I can never attain"Ettare! It is only half after ten. We can't go out to service—and the mission is not four blocks from us. Why not have our little friend run over there, and if there are only two dozen or so in the church, have that young Mr. Lovelow bring them all over here, and let it be Easter in this room?"

He waved his hand to the lilies waiting there all about the walls and doing no one any good but a selfish old man and woman. He looked at me, almost abashed at his own impulse, certain that I would believe him mad. Was ever such a practical Mahomet, proposing to bring to himself some Mountain Delectable?

"Do you mean," I asked breathlessly, "to let them have church in this—"

"Here with us, in the drawing-room," Peleas explained. "Why not? There were fifty in the room for that morning Lenten musicale. There's the piano for the music. And the lilies—the lilies—"

"Of course we will," I cried. "But, oh! will they come? Do you think they will come?"

I turned to our little friend, and she had risen and was waiting with shining eyes.

"Oh, ma'am," she said, trembling, "why, ma'am! Oh, yes'm, they'll come. I'll get 'em here myself. Oh, Mr. Lovelow, he'll be so glad . . ."

She flew to her bright hat and worn coat and crimson muffler.

"Mr. Lovelow says," she cried, "that a mission church is just as much a holy temple as the ark of the government—but he was so glad when we dyed the spread for the orgin—oh, ma'am," she broke off, knotting the crimson scarf about her throat, "do you really want 'em? They ain't—you know they don't look—"

"Hurry, child," said Peleas, "and mind you don't let one of them escape!"

When she was gone we looked at each other in a frightful panic.

"Peleas," I cried, trembling, "think of all there is to be done in ten minutes."

Peleas brushed this aside as a mere straw in the wind.

"Think of Nichola," he portentously amended.

In all our flurry we could not help laughing at the frenzy of our old servant

when we told her. Old Nichola was born upon the other side of every argument. In her we can see the history of all the world working out in a miniature of wrinkles. For Nichola would have cut off her gray hair with Sparta, hurled herself fanatically abroad on St. Bartholomew's Day, borne a pike before the Bastile, broken and burned the first threshing-machine in England, stoned Luther, and helped sew the stars upon striped cloth in the kitchen of Betsy Ross.

Peleas once said that old Nichola proved to him that Liberals and Conservatives, galley-slaves and Pharaohs, are but a kind of geometrical progression in nerves from a fixed base of our common consciousness.

"For the love of heaven," cried Nichola, "church in the best room! It is not holy. Whoever heard o' church in a private house, like a spiritualist see-once, or whatever they are. An' me with a sponge-cake in the oven," she concluded, fervently. "Heaven be helpful, ma'am, I wish't you'd 'a' went to church yourselves."

By means of chairs drawn from the library and dining-room and frantically dusted with Nichola's apron, we were quickly ready, with the lilies turned from the windows to look inward upon the room, and a little table laid with a white cloth and set with a vase of lilies, for the Bible. And, in spite of Nichola, who every moment scolded and prophesied and nodded her head in the certainty that all the thunders of the church would descend upon us, we were ready when the door-bell rang. I peeped from the drawing-room window and saw that our steps were filled!

"Nichola," said I, trembling, "you will come up to the service, will you not?"
Nichola shook her old gray head.

"It's a nonsense," she shrilly proclaimed. "It will not be civilized. It will not be religious. I'll open the door on 'em, but I won't do nothink elst, ma'am."

The sun was slanting madly across our shabby drawing-room, and the lilies were a glory in the light, when we heard their garments in the hall and the voice of Little Friend. Then Peleas threw open

the door, and there was our Easter, come to us upon the threshold.

I shall not soon forget the fragile, gentle figure who led them. The Reverend Stephen Lovelow, with his soul aflame in his luminous face and deep eyes, came in with outstretched hand, and I have forgotten what he said, or, indeed, whether he spoke at all. But he took our hands in his hot, thin hand, and greeted us as the disciple must have greeted the host of that House of the Upper Room. We led the way to the white table where he laid his worn Bible. and then stood in silence while the others found their places, marshaled briskly by Little Friend, who made as efficient a captain as she had a deliverer. There were plenty of chairs and to spare, and when every one was seated, in perfect quiet, the young clergyman bowed his head:

"Lord, thou hast made thy face to shine upon us—" he prayed, and it seemed to me that our shabby drawingroom, with its windows of sun and white bloom, was suddenly glorified and quick with a presence more intimate than the lilies.

When the hymn was given out and there was a fluttering of leaves of the hymn-books they had brought, five of our guests, at a nod from Mr. Lovelow, made their way forward. One was a young woman with a face ruddy, but ruddy with that strange, wrinkled ruddiness of age rather than of youth, and she wore a huge felt hat laden with flaming roses evidently added expressly for Easter day. She had on a thin waist of flimsy pink, with a collar of beads and silver braid, and there were stones of all colors in a half-dozen rings upon her hands. She took her place at the piano . with an ease almost defiant, and she played the hymn not badly, I must admit, and sang in a full riotous soprano. Meanwhile, at her side was ranged the choir. There were four—a great watch-dog of a bass, with swelling veins upon his forehead, and erect reddish hair; a little round contralto in a plush cap, and a dress trimmed with the appliqued flowers cut from a lace curtain; a tall, shy soprano who looked from one to another through the hymn as if she were in personal exhortation; and a pleasant-faced tenor who sang with a will that was good to hear, and was evidently the choir leader, for he beat time with a stumpy, cracked hand set with a huge black ring on its middle finger. The little woman next me offered me her book, and I had a glimpse of a pinched side-face, with a displaced strand of gray hair and a loose linen collar with no cravat, but I have seldom heard a sweeter voice than that which up-trembled beside me-although, poor little woman! she was sadly ill at ease because the thumb which rested upon the book next me was thrust in a glove fully an inch too long. Peleas, he was sharing a book with a youngish man, stooped, long-armed, with a mane of loose black hair, whom Mr. Lovelow afterward told me had lost his position in a sweat-shop through drawing some excellent cartoons on the box of his machine. Mr. Lovelow himself was looking over with a mother and daughter who were afterward presented to us, and who embarrassed any listener by persistently talking in concert, each repeating a few words of what the other had just said, quite in the fashion of the most gently bred talkers bent upon assuring each other of their spontaneous sympathy and response.

And what a hymn it was! After the first stanza they gained in confidence, and a volume of sound filled the low room—ay, and a world of spirit, too. "Christ the Lord is risen to-day, Hallelu-jah! . . . " they caroled, and Peleas, who never can sing a tune aloud, although he declares indignantly that in his head he keeps it perfectly, and I, who do not sing at all, both joined perforce in the triumphant chorus. Ah, I dare say that farther down the avenue were sweetvoiced choirs that sang music long rehearsed, golden, flowing, all compact of spirit and sweet sound, and yet I think there was no more fervent Easter music than that in which we joined. It was as if the other music were the censersmoke, and we were its shadow upon the ground, but a proof of the sun, for all

I cannot now remember all that simple service, perhaps because I so well remember the very glory of the hour. I

sat where I could glimpse the sunny park stretching away, black upon silver and silver upon black, over the tops of sheaves of Ascension lilies. The face of the young minister was illumined as he read and talked to his people. I think that I have never known such gentleness, never such yearning and tenderness, as were in him for that handful of crude and careless and devout. And though he spoke passionately and convincingly, I could not but think that he was like some dumb thing striving for the utterance of the secret fire withinstriving to "burn aloud," as a violin beseeches understanding. Perhaps there is no other way to tell the story of that first day of the week—"early, when it was yet dark."

"They had brought sweet spices," he said, "with which to anoint Him. Where are the spices that we have brought to-day? Have we aught of sacrifice, of charity, of zeal, of adoration let us lay them at His feet, an offering acceptable unto the Lord, a token of our presence at the door of the sepulcher from which the stone was rolled away. Where are the sweet spices of our hands, where the pound of ointment of spikenard wherewith we shall anoint the feet of our Lord? For if we bring of our spiritual possession, the Christ will suffer us, even as he suffered Mary; and the house shall be filled with the odor of the ointment."

"And the house shall be filled with the odor of the ointment," I said over to myself. Is it not strange how a phrase, a vista, a bar of song, the thought of God beneath the open stars, will almost pierce the veil?

"And the house shall be filled with the odor of the ointment," I said silently all through the last prayer and the last hymn and the benediction of "The Lord make his face to shine upon you, the Lord give you peace." And some way, with the rustle of their rising, the abashment which is an integral part of all such gatherings as we had convoked was not to be reckoned with, and straightway the presentations and the words of gratitude, and even the pretty anxiety of Little Friend fluttering among us, were spontaneous and unconstrained.

It was quite as if, Peleas said afterward, we had some way magically been reduced to a common denominator! Indeed, it seems to me, remembering the day, as if half the principles of Christian sociology were illustrated there in our shabby drawing-room; but, for that matter, I would like to ask what complexities of political science, what profound bases of solidarité, are not on the way to be solved in the presence of Easter lilies? I am in all these matters most stupid and simple, but at all events I am not blameful enough to believe that they are exhausted by the theories.

Every one lingered for a little, in proof of the success of our venture. Peleas and I talked with the choir and the pianiste, and this lady informed us that our old rosewood piano, which we apologetically explained to be fifty years old, was every bit as good and every bit as loud as a new golden-oak instrument belonging to her sister. The tall, shy soprano told us, haltingly, how much she had enjoyed the hour, and her words carried with them all sincerity in spite of her strange system of over-emphasis of everything she said, and a carrying down the corners of her mouth, as if in deprecation. The plump little contralto thanked us, too, with a most winning smile—such round open eyes she had, immovably fixed on the object of her attention, and, as Peleas said, such evident eves.

"Her eyes looked so amazingly like eyes," he afterward commented, whimsically.

We talked, too, with the little woman of the long-thumbed gloves, who had the extraordinary habit of smiling faintly and turning away her head whenever she detected any one looking at her. And the sweat-shop cartoonist proved to be an engaging young giant with the figure of a Greek god, classic features, a manner of gravity amounting almost to hauteur, and the most pronounced East Side dialect that I have ever heard.

"Will you not let us," said I to him, after Mr. Lovelow's word about his talent, "let us see your drawings some time? It would give us great pleasure."

Whereupon, "Sure. Me, I'll toin the whol' of 'em over to youse," said the

Greek god, thumbs out and shoulders flickering!

But back of these glimpses of reality among them there was something still more real; and though I dare say there will be some who will smile at the whole affair, and seek to "rationalize" upon it, and call that interest curiosity and those awkward thanks mere aping of convention, yet Peleas and I, who have a modest degree of intelligence and had the advantage of being present, do affirm that, on that Easter morning, countless little doors were opened in the air to admit a throng of sweet presences. We cannot tell what it may have been, and we are helpless before all argument and incredulity, but we know that a certain stone was rolled away from the door of * the hearts of us all, and there were with us those in shining garments.

In the midst of all I turned to ask our Little Friend some trivial thing, and I saw that which made my old heart leap. Little Friend stood before a table of the lilies, and with her was young Mr. Lovelow. And something—I cannot tell what it may have been, but in these matters I am rarely mistaken; and somethingas she looked up and he looked down made me know, past all doubting, how it was with them. And this open secret of their love was akin to the mysteries of the day itself. The gentle, sad young clergyman and our Little Friend of the crimson muffler had suddenly opened to us another door and admitted another joyous presence. I cannot tell how it may be with every one else, but for Peleas and me one such glimpse—a glimpse of two faces alight with happiness on the street, in a car, or wherever they may be—is enough to make glad a whole gray week. Though, to be sure, no week is ever wholly gray.

I was still busy with the sweet surprise of this, and longing for opportunity to tell Peleas, when they all moved toward the door, and, with good-bys, filed into the hall. And there in the anteroom stood Nichola, our old servant, who brushed my elbow and said in my ear.

"Mem, every one of 'em looks starvin'. I've a kettle of hot coffee ready an' there's fresh sponge-cake in plenty. I've

put cups on the dinin'-room table, an' I thought—"

"Nichola!" said I, in a low and, I must believe, positively ecstatic tone.

"An' no end o' work it's made me, too," added our old servant, sourly, and not to be thought in the least gracious.

It was a very practical ending to that radiant Easter morning, but, indeed, I dare say we could have devised none better. Moreover, Nichola had ready sandwiches and a fresh cheese of her own making, and a great bowl of some simple salad dressed as only Nichola's Italian hands can dress it. I wondered, as I sat in the circle of our guests, a vase of Easter lilies on the table, whether Nichola, that grim old woman, who scorned to come to our service, had yet not brought her pound of ointment of spikenard, very precious.

"You and Mr. Lovelow are to spend the afternoon and have tea with us," I whispered Little Friend, and had the joy of seeing the tell-tale color leap gloriously to her cheek and a tell-tale happiness kindle in his eyes. I am never free from amazement that a mere word, or so humble a plan for another's pleasure, can give so much joy. Verily, one would suppose that we would all be so busy at this pastime that we would almost neglect our duties!

So when the others were gone these two lingered. All through the long, spring-gold afternoon they sat with us beside our crackling fire of bavin-sticks. telling us of this and that homely interest, of some one's timid hope and another's sacrifice, in the life of the little mission. Ah, I dare say that Carlyle and Hugo have the master's hand for touching open a casement here and there and letting one look in upon an isolated life, and, sympathizing for one passionate moment, turn away before the space is closed again with darkness; but these two were destined that day to give us glimpses hardly less poignant, to open to us so many unknown hearts that we would be justified in never again being occupied with our own concerns. And when, after tea, they stood in the dusk of the hallway trying to say good-by, I think that their secret must have shone in our faces too, and, as the children say, "we all knew that we all knew," and life was a thing of heavenly blessedness.

Young Mr. Lovelow took the hand of Peleas, and mine he kissed.

"The Lord bless you, the Lord make his face to shine upon you, the Lord give you peace," was in his eyes as he went away.

"And, oh, sir," Little Friend said shyly to Peleas as she stood at the top of the steps, knotting her crimson muffler, "ain't it good, after all, that Easter was all over ice?"

That night Peleas carried upstairs a great armful of the Ascension lilies to stand in the moonlight of our window. We took lilies to the mantel, and set great stalks of bloom upon the table, with their white trumpets turned within upon the room. And when the doors had been made fast and the lower lights extinguished, and Nichola had bade us her grumbling good-night, we opened the door of that upper room where the moon was silvering the lilies; and, on a sudden, in the dimness we stood still, smitten by a common surprise.

"Peleas," I said, uncertainly, "oh, Peleas! I thought--"

"So did I," said Peleas, with a deep breath.

We bent above the lilies that looked so sweet-scented and yet had been barren of fragrance because, we had told ourselves, they were, perhaps, flowers of symbol, without mission or message beyond the symbol, without hue or passion, or, so to say, experience. ("Perhaps if one were to make some one happy with them, or to put them in a bride's bouquet, they would no longer be scentless," Peleas had quaintly said.) And now Peleas and I were certain, as we stood hushed beside them, that our Easter lilies were giving out a faint, delicious fragrance.

I looked up at him almost fearfully in the flood of spring moonlight. The radiance was full upon his white hair and tranquil face, and he met my eyes with the knowledge that we were suddenly become the custodians of a strange, exquisite secret. The words of the young servant of God came to me understandingly.

"'And the house shall be filled with the odor of the ointment,' I said over, softly. "Oh, Peleas," I added, tremulously, "do you think . . ."

Peleas lifted his face, and I thought that it shone in the dimness.

"Ah, well," he answered, "we must believe all the beautiful things we can."

Comment on Current Books

Among the books of special New Books interest just published, and on of Importance which comment will be made later on in The Outlook, may be mentioned: Mr. Horace Traubel's "With Walt Whitman in Camden" (Small, Maynard & Co.), a volume of personal reminiscences by one whom some reviewer has termed Whitman's Boswell; Professor John C. Van Dyke's "The Opal Sea" (Scribners), which, like Professor Van Dyke's "The Desert," is a study in impressions and appearances; "The Memoirs of Archbishop Temple," by "Seven Friends" (Macmillan); Mr. Stephen Phillips's "Nero," a drama in blank verse: and a new volume in the standard reference-book, "Grove's Dictionary of Music and Musicians" (Macmillan).

The Art of Keeping Well A sensible book of advice out of a half-century of experience. The cheerful, spiritual tone of the writer is more fully

accounted for in the biography filling half of the book, and in the tributes paid to her high character and great usefulness from men and women who came within her influence during her long and busy life. Her usefulness and her charities are perpetuated in the lives of her many friends, though she has entered the "upper room." (The Art of Keeping Well. By Cordelia A. Greene, M.D. Dodd, Mead & Co., New York. \$1.25, net.)

Bruges and West Flanders of illustrated descriptions of picturesque lands. The fascination of the "dead cities" of Flanders has been felt by many travelers, who will be eager to read these bits of history and comment by Mr. Osmond, and enjoy at the same time the admirable colored plates done by Amedée Forestier. Each one of these quaint, often despoiled towns has remaining some romantic relics and picturesque buildings—belfry, market-place, Hôtel de Ville—old

gateways, or churches enriched with paintings. In Bruges the Belfry "old and brown, thriced consumed and thrice rebuilded," or the Hospital of St. John, with its priceless Memlincs, or the quiet and quaint Béguinage, or the glimpses of silent canals which Bruges shares in common with many cities in the Low Countries, all return to the memory, and impel one to revisit the town. West Flanders is still less influenced by change, and the country lying back from the coast, between the borders of France and Holland, retains the Flemish speech and the Flemish independence of manner. It is strange that among so many pictures the Belfry of Bruges does not appear in this volume, though the Market-place, more picturesque than in reality, has a place. While the text of the book is not remarkable in any way, it is written in clear, simple style, and rehearses the main historical points desirable for a reader to know. Among the towns of West Flanders are Ypres, Furnes, with its mediæval annual procession of penitents, Nieuport, and Coxyde. The amazing and decidedly disturbing contrast between the dreamy quiet of the "dead cities" and the blatant, dazzling glare of the terribly new wateringplaces on the coast, overrun by tourists and the unspeakable English variety known as "trippers," is not too strongly shown, and makes the conservative traveler wish there were not so many people in the world, or that a less number could afford to journey abroad. (Bruges and West Flanders. By G. W. T. Osmond. The Macmillan Company, New York: \$3.)

The two books whose titles are Concerning given below approach the sub-Immortality ject of immortality from different points of view. Professor Ostwald, Professor of Chemistry at the University of Leipzig, treats the question as a purely scientific problem. His conclusion is that "the only lasting kind of life that I can discover in the realm of our experience" is the immortality of influence. This is not a very satisfactory conclusion to one whose friend has disappeared into the unknown future Nor is the process of investigation any more satisfactory. Immortality, at least as Professor Ostwald regards it, is a hope of the future. Hope is not seen, "for what a man seeth why doth he yet hope for?" but natural science deals only with what is seen. Whatever in the unseen it deduces from the seen is at the best but a working hypothesis, and immortality as a working hypothesis is not of any great vital value. Dr. Crothers approaches the problem as a philosopher, or rather as a prophet. His volume is an interpretation of life by a seer. To him immortality is a present experience, a kind of life rather than a mere duration: it is qualitative, not merely quantitative. Dr. Crothers's conclusion is summed up in these two sentences: "'Beloved, now are we the sons of God, and it doth not yet appear what we shall be.' Conscious of the divine quality of the present life, one can afford to wait for the things which do not yet appear." It can hardly be necessary for The Outlook to add that of these two the second appears to us to be the saner and more rational point of view. (The Endless Life. By S. M. Crothers. Houghton, Mifflin & Co., Boston. 75c. Individuality and Immortality. By Wilhelm Ostwald. Houghton, Mifflin & Co., Boston. 75c.)

Mrs. Burnett has followed The Dawn some other writers into of a To-Morrow the London slums, and gives us a dramatic, perhaps a melodramatic, view of the dreadful conditions there. A rich, titled man, without hope in the world, decides to end his life in the obscurity of a shabby London lodging-house. Reversing the plot of Lord Fauntleroy, in this case the weary man is shown the better way by an ugly, untaught child, and learns, among his squalid surroundings and poverty-stricken companions, that life is worth living, and worth too much to be thrown away. There is a decidedly tense air about the short story, which detracts from its intended effect. (The Dawn of a To-Morrow. By Frances Hodgson Burnett. Charles Scribner's Sons, New York. \$1.)

Dr. Bliss here tells The Development of the story of his prede-Palestine Exploration cessors in the field in which he has won distinction. It is a long line, in which the typical modern explorer first appears in Felix Fabri, four centuries ago. The moderns most prominent in this narrative, originally given as the Ely Lectures at Union Seminary in 1903, are our countryman, Professor Edward Robinson, Renan, his contemporaries, and the workers sustained by the Palestine Exploration Fund, organized in 1865. What Dr. Bliss gives us is for the most part a bird's-eye view of a large field, with some details of the sites with which he has been personally concerned, as at Tell-el-Hesy (the ancient Lachish) and Jerusalem. While only twenty of many hundreds of sites have been excavated, there still is much to expect, for the realizing of which some practical suggestions are given. (The Development of Palestine Exploration. By Frederick Jones Bliss, Ph.D. Charles Scribner's Sons, New York. \$1.50, net.)

The Girls of Gardenville

attractions of innocence and youthful faults.

"The Sweet Sixteen" Club made fudge, and went on picnics, and behaved just as jolly, nice maidens should. (The Girls of Gardenville. By Carroll Watson Rankin. Henry Holt & Co., New York. \$1.50.)

The romance of a little French A Lady countess in the court of Marie in Waiting Antoinette is interesting, though not novel either in plot or style. Escaping "paying the debt" that all her family paid with their lives, the lady fled to America, where she won the republican court of Washington as she had the aristocratic court of France. We are gratified to know that her sweetness and beauty were rewarded by happy love and a home in her own country at last. The miniature portrait shows "Julia de Chesnil" to be a charming figure. (A Lady in Waiting. By Charles Woodcock Savage. D. Appleton & Co., New York. \$1.50.)

The provincial life of a little A Lame Dog's English village is reflected in this clever diary kept by an invalid officer who returned crippled from the Boer War. The suggestion of the diary came from a winning, tantalizing young widow, who cheered the invalid by her amusing, paradoxical talk. The diarist and his sister Palestrina are true English types—quiet gentlefolk. The romance glowing beneath the light tone of the diary is delightful and novel enough to insure the reader's attention to the end. The author has a good sense of humor. (A Lame Dog's Diary. By S. McNaughton. Dodd, Mead & Co., New York. \$1.50.)

While our country's growth The Launching in material wealth and of a University power is more obvious to the common eye, its more fundamental interests have not been neglected; its creation and fostering of great universities has been equally remarkable. Rather more than a third of this volume is commemorative of the founding and growth of an institution which distinctly advanced our ideal of university education-the Johns Hopkins University, of which the writer, Dr. Daniel Coit Gilman, was the master builder, and for its first quarter-century the President. Suppressing to the utmost his own part therein, Dr. Gilman devotes himself to commemorating the work and genius of his associates. It was a rare and brilliant group of torchbearers in the advance of learning that he gathered round him in Baltimore, and it is a

rich "sheaf of remembrances" that he has preserved in noteworthy reminiscences and characterizations of gifted men, set forth in finished literary form with here and there a gem of pleasantry and wit. Following this are addresses at various universities on great occasions, such as the Yale Bicentennial, and as many others, given elsewhere, on themes of educational and civic importance. Dr. Gilman is now at the head of the Carnenegie Institution for the Advancement of Knowledge, and takes the present opportunity to say something of it for better public information. But Johns Hopkins is his memorial, and will be. (Launching of a University, and Other Papers. By Daniel Coit Gilman, LL.D. Dodd, Mead & Co., New York. \$2.50, net.)

In preceding volumes thus The Life of entitled Professor George Reason Santayana, of Harvard, has examined the "phases of human progress" in common sense, society, religion, and art. In this volume he examines them in science, mainly in mental and moral science—history, dialectics, psychology, ethics. The fundamental misconceptions that have been noticed in the former volumes stand out in this. "No causes are other than mechanical." "Historical research is a part of physics." A man's life is predetermined by his nature. "The morality which has genuine authority exists inevitably, and speaks autonomously in every common judgment, self-congratulation, ambition, or passion that fills the vulgar day "-a statement that inevitably reminds one of Nietzsche. Yet a higher strain, discordant with this, is also heard. Though existence is "irrational," reason gets in somehow from somewhere. "To stop at selfishness is not particularly rational. ... It is discipline that renders men rational and capable of happiness, by suppressing without hatred what needs to be suppressed to attain a beautiful naturalness. . . . The true conscience is rather an integrated natural will, chastened by clear knowledge of what it pursues and may attain." Intellectualism thus makes the difference between the spiritually and the materially minded man. But the only advantage of this "spiritual life" is that "the physical equilibrium attained insures to it a natural stability and a natural prosperity" so long as the body lasts. "An ultimate extinction of man and all his works" should not seem a thought intolerable. Professor Santayana's skeptical criticism of scientific method and progress has the advantage of a charming literary style, coupled with the drawback of a nil admirari tone that leaves the reader unrelieved by the consciousness of getting much help toward the goal of moral endeavor for moral reality. (The Life of Reason. By George Santayana. Charles Scribner's Sons, New York. \$1.25.)

Of the various misuses of Melody in speech in public address, prob-Speech ably the worst is that of the man who preaches consciously artificial elocution; the next worst is that of the man who imagines that to be "natural" is all that is required of a public speaker. It is almost as necessary to learn how to use one's voice in speech as to learn how to use one's fingers in playing the pianoforte. A good vocal teacher is desirable, but not always, perhaps we should say not often, obtainable. In the absence of such a teacher, this little book, in its third edition, will be found a manual of proved value. The "reminiscences" of Professor Raymond's teaching given in the appendix prepared by his son, R. W. Raymond, add value as well as interest to the book. (Melody in Speech: A Book of Principle, Precept, and Practice in Inflection and Emphasis. By Robert R. Raymond, A.M.; edited and published after his death by R. W. Raymond. New York, 1906.)

Miss Primrose

These character studies are so slight as to be sketches rather than stories, but they have a delicacy and sincerity which give them literary interest. They are gathered into three groups, the chapters of each having a common purpose. There are gentle pathos and quaint humor to be found throughout. (Miss Primrose. By Roy Rolfe Gilson. Harper & Brothers, New York. \$1.25.)

Although the "Story of the A New History Nations" series already of Greece possesses a volume on Greece by Professor James A. Harrison, the general editor of the series is amply justified in including this new volume by Dr. Schuckburgh, whose point of view is entirely different from the earlier work, which was mainly an outline. Here stress is laid upon the political, intellectual, and artistic achievements of the Greeks, rather than on the wars in which Greece engaged. The narrative reads easily, and has the merits of a consecutive and well-proportioned story. The period covered is from the occupation of Greece by the Hellenes up to A.D. 14, and a second volume is proposed dealing with the later history of the Greeks' waning power and fame. (The Story of the Nations: Greece.

By E. S. Schuckburgh, Litt.D. G. P. Putnam's Sons, New York. \$1.35, net.)

The Prisoner of Ornith Farm

A frankly sensational story by the author of "The House on the Hudson." One must not inquire too critically as to the underlying probabilities of such tales. Both of these books have vividness and suspense and show considerable ingenuity in sustaining the reader's attention in the main situation by the dramatic way in which the successive incidents are managed; but both are weak as to the motive for action. (The Prisoner of Ornith Farm. By Frances Powell. Charles Scribner's Sons, New York. \$1.50.)

The Spirit of A graceful story by a new writer which follows somethe Pines what the lines of a popular romance that appeared several years ago. A young woman of the world, suffering bereavement, went for retirement to an old manse in Vermont. There she met a young physician who, his health being broken, was ordered to Colorado, and given but a few years to live. This propinquity caused the tragedy of love and separation. While the romance is slight, it is refined and combines strength with pathos. (The Spirit of the Pines. By Margaret Moore. Houghton, Mifflin & Co., Boston. \$1.)

The Title-Mart

This is a frankly tarcical play aimed at title-hunting and toadyism among American fashionable people. The scene is placed in a millionaire's "camp," near his native New England vilage; and there is, in addition to the social satire, a quaint flavor of Yankee country life. (The Title-Mart. By Winston Churchill. The Macmillan Company, New York. 75c., net.)

The young lady who The Truth About achieved popularity at a Tolna single stroke, Miss Bertha Runkle, has written of an American fortnight almost as crowded with events as were those few amazing days in "The Helmet of Navarre." There are a dash and vigor about the handling of this novel of modern New York life that will carry it, perhaps, beyond its real merits. The double character forced upon Tolna by his artistic friend and manager gives opportunity for several farcical situations and an occasional semi-tragic note. Tolna and Mrs. Burnham are most entertaining. Denys Alden is less convincing than some other members of his social set. (The Truth About Tolna. By Bertha Runkle. The Century Company, New York. \$1.50.)

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

THE OUTLOOK COMPANY

Chicago Office, 1436 Marquette Building

287 Fourth Avenue, New York

Copyright, 1906, by the Outlook Company. Entered as second-class matter in the New York Post-Office.

As usual with McCutcheon Waists, they are characterized by an individuality in style and care in workmanship which leaves no question as to their high qualities. Made in the following materials:

Butcher's Linen -Madras -\$3.50, \$4.00, \$4.50 \$4.00 **Scotch Cheviot** \$3.50 \$3.50 Irish Dimity **English Pique** \$3.75 Pure Linen Lawn \$4.50

Medium Weight Linen \$4.00, \$4.50

We also display a good line of Lingerie Waists of both French and Domestic make. Prices of domestic waists from \$7.50 to \$25.00. French from \$12.50 to \$50.00 each.

Hand-Embroidered Linen Waist Patterns (unmade) from \$2.50 to \$35.00. Embroidered Linen Robes from \$10.50 upwards.

We are pleased at all times to send samples of our Waist materials. When ordering it is necessary to send bust measurement only.

Mail Orders have our special and prompt attention.

The beef-packers in-"Immunity Bath ", dicted under the Sherman Anti-Trust Law, charged with a conspiracy in restraint of trade, were declared by Judge Humphrey, of the United States District Court in Chicago, last week, immune against prosecution. The history of the case may thus be epitomized: In order to obtain information for further perfecting the law concerning corporations, Congress empowered the Department of Commerce and Labor to make investigations into corporation management. In accordance with this authorization, the Bureau of Corporations in the Department of Commerce and Labor examined certain packers. Later the Department of Justice had these packers indicted. The packers claimed immunity under the law. Judge Humphrey's decision, which was rendered orally, was in their favor. man's constitutional right to refuse to incriminate himself can be altered only by the substitution of an equivalent or a broader right. This substitution has been made by statute to the effect that a a man who testifies against himself under compulsion cannot be prosecuted. Judge Humphrey holds that, in order to provide immunity, his testimony does not need to be self-incriminating; it need only be evidence "concerning the matter covered by the indictment." In this respect the decision is not a statement of common law, but an interpretation of the Judge Humphrey, moreover, statute. decided that, although the testimony given to the Bureau of Corporations was not under oath or under compulsion of subpœna, it was in effect legal in character and involuntary. Although the officials are exempt, the corporations are, of course, as Judge Humphrey pointed out, amenable to prosecution. If Judge Humphrey's interpretation stands, it appears to us that the statute needs modification. It certainly seems anomalous that a man guilty of conspiracy in restraint of trade can go before a Government official in response to the requirements of a statute, offer testimony which does not reveal his criminal action, and thereupon become invulnerable against the weapons of justice. As Attorney-General Moody said, this is equivalent to supplying corporation magnates with a legal Carlsbad where they can in comfort cleanse themselves periodically of their misdoings—a sort of "immunity bath." If the Supreme Court has denied to corporation officials the right to set up the privileges of a corporation, this decision seems to give them more than ample privileges on their own account.

6

Clinging to the Spoils

When has a popular convention at Washington, influencing some

measure before Congress, been immediately followed by Congressional action? Yet such action followed the National Consular Reform Association's appeal a fortnight ago to the House of Representatives to pass the Consular Bill. Last week the bill was passed, minus the clause authorizing the transference of consular officers in the same grade from one place to another according to the needs of the service. This provision is regarded as so important by most members of the Consular Reform Association and by many legislators who voted for it in the Senate that they are trying to have it reincorporated. Senate and House conferees are Senators Lodge, Cullum, and Hale, Representatives Adams, Denby, and Towne; we earnestly hope that they will agree to support the clause. The opposition to it in the House comes, first, from Congressmen who want to retain certain particular consuls in certain particular

Digitized by Google

"fat offices." If we may not have the admirable direct promotion clause (struck out by the Senate and largely for the same reason), the efficiency of the service demands at least a provision for transference, to enable in some slight degree the State Department and the President to reward merit and to take advantage of the power to transfer in one grade, at times perhaps getting the right man in the right place. Secondly, the opposition is caused by a civil service feature in the clause. Congressmen apparently see in it the thin edge of the wedge; what if Civil Service Reform were extended to the whole consular service! Hence, by their action, Congressmen would indicate that they still think more of personal and selfish interests than of the National and broad interests affected by the civil service feature which provides that

No consul-general or consul shall be transferred to a country in which the United States exercises extraterritorial jurisdiction until he shall have passed an examination in the fundamental principles of the common law, the rules of evidence, and the trial of civil and criminal cases.

The principal country in which we exercise extraterritorial jurisdiction is China. While the general quality of our consuls there is gratifyingly improving, there is still room for improvement. In order to attain it we need somewhat to change our own attitude of mind. We need to consider solely the reputation in China as to the character, ability, and judicialmindedness of our representatives there, and not their personal attractiveness or their political influence here. Acting upon this, our consular standard will in general be still further raised, and, in particular, we will have done much towards bringing about a friendlier feeling towards us among a people whom we have wronged. This, among other desirable results, is what the final phrase in the offending clause would accomplish.

Private Interests or Public Justice?

Not a few protectionists have joined in the effort to have the Philippine Tariff Bill called back for action in the Senate from the committee which, as already stated in The Outlook,

has refused to report at all on the measure, thus obstructing an obviously right and fair-minded method of commercial relief to the Filipinos. This bill provides, as our readers will remember, that sugar and tobacco may be imported from the Philippines into the United States at one-quarter of the Dingley tariff until 1909, after which time those products are to come in free of tax. Notable among the protests against the present policy of repression is a letter sent to the two Senators from Connecticut signed by seventeen of the most prominent business men of that State, all Republicans and all protectionists. They declare that a vote against the bill would "misrepresent the overwhelming Republican sentiment in Connecticut." names signed to this letter and the manufacturing interests represented give it weight and show that it fairly represents hundreds of other practical men of the same party affiliation and economic be-The Hartford "Courant," a stanch and able supporter of the policy of protection, says, in commenting on the letter: "It is mighty refreshing to have strong men of unimpeachable character and purpose speak out in this vigorous way. We have every reason to believe that they speak the sentiments of the great majority of the people of the State in their appeal, and we venture to hope that they do not appeal in vain." Even the tobacco interests, as a Connecticut Congressman, Mr. Hill, has shown, are not unanimous in holding that the bill is an injury to them, and it is hardly to be believed that the production of 600,000,-000 pounds of tobacco in this country is likely to suffer from the possible importation of some part of the 19,000,000 pounds of Philippine production, while as to sugar the price will continue to be fixed by the importations which pay the full duty. Senator Brandegee attempts to justify his hostility to the bill by asserting that American labor would by its enactment be brought into competition with Asiatic labor. The answer is simple: We have brought the Filipinos under American rule, and while they continue to be American subjects their interests must be guarded and they must have a fair chance for improvement and

prosperity. Senator Brandegee declares that he cannot see "any moral question or any question of good faith involved," but a large part of his own constituents and of the people of the United States have no difficulty in seeing that such a question exists and is of paramount importance. If the Connecticut Senators were elected by the people of their State directly, they would not place the desire of some of the rural members of the Legislature chosen on an antiquated plan of misrepresentation to outweigh the sentiment of the State at large as indicated by the press and by such remonstrances as that quoted above.

a

What promised at first to An Insult to be a triumph of orderly prothe Nation cedure over mob violence was turned suddenly last week into defiance of the most august tribunal of the Nation. A negro in Tennessee was a few weeks ago charged with the crime which has often been regarded as the only excuse for lynching. Before and during his trial great care was taken to keep him from bodily harm at the hands of lawless men. The negro churches of the vicinity passed resolutions condemning the crime for which he was charged and calling upon the race to regard all those who commit the crime as insufferable. The accused negro was defended by reputable white lawyers. He was identified by the victim as the real criminal. The jury brought in a verdict of guilty and the prisoner was sentenced to be hanged. Then occurred a proceeding which, to say the least, was unfortunate. The counsel for the condemned man. after consultation with the representatives of the State, decided not to appeal the case. The ground on which their decision was placed was hardly creditable; it was, namely, that any further trial of the case would arouse the lynching spirit and that therefore the condemned man should waive his right to an appeal and go to his death. Outlook has long held that appeals in criminal cases are too frequent and easy in this country; but it does not require any great intelligence to discern the peril in abandoning even a faulty judicial method out of fear of the lawless and the violent. This fear has now brought its natural consequences. People of his own race engaged on behalf of the prisoner other counsel and appealed his case. The United States Supreme Court granted the appeal, which was equivalent also to a stay of execu-Thereupon the violence which had been anticipated, and we cannot help but feel involuntarily encouraged, by lawyers engaged in the case, broke out. The prisoner, insufficiently guarded, was taken, by an apparently well-organized though small body of men, and killed. The lynching mob thus at last has not merely defied the State, but has affronted the dignity of the whole Nation by its insult to the United States Supreme Court. Happily, this excessive and peculiarly uncontrolled exhibition of a deliberate lynching spirit comes at a period when lynching is rapidly decreasing. This incident ought to serve as a stimulant to that public reprehension of lynching which is apparently leading to the extinction of this particularly uncivilized form of crime. We hope that it can be found that the Supreme Court has the power to take some action with regard to this lynching, which was really if not legally an act of contempt for its own decision.

€

Rapid Transit in

In his settlement of

the rapid transit Philadelphia problem in Philadelphia Mayor Weaver has just consummated what to many seems to be the most notable achievement of his already notable administration. Our readers will recall that in 1901 the "midnight acts." as they were called because of their signature by Governor Stone at midnight of the day they were passed by the Legislature, and in the presence of Senators Quay, Penrose, and the big and little bosses of the principal cities of the State, enabled the Council of Philadelphia to give away without any consideration to favored corporations immensely valuable franchises over, under, and on the streets of Philadelphia, notwithstanding Mr. John Wanamaker's cash offer of

\$2,500,000 for them, in addition to other

substantial guarantees in the public

interests. These franchises, thus filched from the public through the treachery of the Legislature and of the Councils of Philadelphia, were subsequently sold to the Philadelphia Traction Company, and the promised competition which was the one excuse offered in their behalf made The Philadelphia Rapid impossible. Transit Company was created to take over the old and new franchises. It has thus far sought to exercise its right under only one of the ordinances, that providing for the subway on Market Street, but this dog-in-the-manger policy has prevented real competition and has resulted in delaying the solution of the rapid transit problem in the city. A few weeks ago a new corporation known as the Philadelphia and Western Railroad offered to provide this competition in the form of elevated and subway structures, and at a time when the Rapid Transit Company needed an extension of time for the completion of its subway. Mayor seized the opportunity to force a settlement of the whole question, and this has just been completed in a way that is satisfactory alike to the merchants who were anxious for the completion of the Market Street subway because of the improved facilities that it would provide, and to the citizens who were anxious to have competition and a satisfactory general solution of the vexed problem of adequate transportation facilities. As the "North American" pointed out in a commendatory editorial, "the Mayor played a weak hand with consummate skill," and has compelled the Philadelphia Rapid Transit Company to surrender many of its stolen franchises, thus clearing the way for the Philadelphia and Western Railroad, and removing the danger of disfiguring tracks on the city's principal thoroughfare, Broad Street. Moreover, the Rapid Transit Company has agreed to pay \$400,000 to be applied upon the cost of removing certain grade crossings of the Reading Railroad. the other hand, it has agreed to complete within three years a number of other subways, and an elevated railway from the river front and South Street to Frankford, an important northeastern suburb. The Philadelphia and Western Railroad receives the franchises it asked for, thus

insuring a great increase in transportation facilities and substantial competition to the existing company along a considerable portion of its route. "North American" describes the situation as the "dawning of a new day," claiming that less than a year ago Philadelphia was apparently "helpless in the grasp of three great monopolies—the political monopoly of the Republican organization, the public highway monopoly of the Rapid Transit Company, and the steam railroad monopoly of the Pennsylvania Railroad Company. The first has been broken, overturned, and destroyed, the second is as good as broken," and it declares that the third is shortly to be disrupted. For years the Pennsylvania Railroad has been the dominating political factor in Philadelphia and Pennsylvania politics, and has been able either to prevent its competitors from entering the city, or has greatly delayed the execution of their plans, or has dictated the terms upon which they could enter. As it now controls both the Baltimore and Ohio Railroad and the Reading Railroad through stock ownership, there is practically but one railway interest in Philadelphia. If, as is supposed and stated, the proposed road is a part of the Gould system, then the "North American's" prophecy is likely to come true. There has been great rejoicing in Philadelphia over the Mayor's victory, not only because of the substantial results which will accrue, but because it marks the beginning of real rapid transit in the city and because it represents so complete a change from old methods.

The Remonstrance of the Labor Leaders of organized wage-earners, including Mr. Samuel Gompers, President of the American Federation of Labor, called upon the President last week and laid before him a remonstrance. They complained on behalf of organized labor that a recent enactment would nullify the eight-hour law in its application to the work on the Panama Canal; that bills now before Congress would reverse the American policy with regard to Chinese exclusion, and would endanger the free-

dom of American seamen; that insufficient Government supervision has made possible unskilled crews on vessels in American waters, with a consequent terrible loss of life; that the present antitrust laws have been perverted to the violation of the rights of labor; that the Committee on Labor in the House of Representatives is so organized that it ignores the requests of organized labor and is hostile to its interests; and that in the matter of immigration, of Chinese exclusion, of injunctions, and of the redress of the grievances of Government employees, the Executive department has disregarded the interests of the wage-earners. An identical memorial was presented to each House of Congress through its presiding officer. The remonstrance closed with this warning: "If perchance you may not heed us, we shall appeal to the conscience and support of our fellow-citizens."

•

In spite of this misdi-The President's rected appeal to fear of Reply political influence, the labor leaders received from the President a reply which was by no means unsympathetic. It abounded, however, in plain speech. Mr. Roosevelt pointed out that, in the four and a half years he had been President, the Government, as it had happened, had invoked the right of injunction many times against capitalists, but not once, so far as he remembered, against a combination of laborers. "But understand me, gentlemen," he added; "if I ever thought it necessary, if I thought a combination of laborers were doing wrong. I would apply for an injunction against them just as quick as against so many capitalists." Naturally, capitalists, as capitalists, are against the anti-injunction bill; and legislators have criticised it as going too far; if the labor leaders thought it did not go far enough. the President assured them, they would "have no earthly difficulty in killing the bill." We hope Mr. Gompers and his associates saw the humor of the position into which they might thus put themselves. The President frankly expressed his belief in the eight-hour law for the United States, but as clearly expressed

his belief in its impracticability for Panama. Similarly, he affirmed his belief in the exclusion of Chinese coolies; but he added that he would do everything in his power to make it easy and desirable for the Chinese of the business and professional classes, the Chinese travelers and students, to come here, and to secure their good treatment when they come. As good citizens, indeed, he said his hearers ought to uphold this course. "No laboring man," he said, "has anything whatever to fear from that policy, and no man can say with sincerity that on this or indeed on any other point has he any excuse for misunderstanding my policy." In stating the principles by which he is guided with regard to immigration, he stated the more fundamental principle by which he is guided as the Chief Executive of a self-governing Nation: "This is needed first in the interests of the laboring man, but furthermore in the interests of all of us as American citizens. For, gentlemen, the bonds that unite all good American citizens are stronger by far than the differences, which I think vou accentuate altogether too much, between the men who do one kind of labor and the men who do another." We believe that wage-earners, like other citizens, will value this frankness. Some public men are now ready to deny justice to the Philippines out of regard for the power of a set of special corporate interests; other public men are ready to continue our humiliating treatment of Chinese out of regard for the power of a set of special labor interests. At such a time the country cannot be too grateful to public men who openly acknowledge that they are guided only by what they believe to be the interest and honor of the whole people.

♚

The Labor Situation in the Coal Industry

The Coal Industry

The negotiations between the soft-coal operators and mine workers looking toward a compromise of their differences as to the wages to prevail in that industry following April 1 continue at this writing in an unsatisfactory state. The conventions of both operators and mine workers in session at Indianapolis the past ten

days have been unable to reach an agreement, and the prospect now is that the amicable settlement of the differences forecast in President Mitchell's address to the special convention of the United Mine Workers of America will not be attained. In this address he expressed hope of re-establishing relations with the operators "upon a basis which will be just to them, reasonably satisfactory to the great constituency we represent, and at the same time properly considerate of the welfare of the entire country, whose interests cannot be disregarded with impunity by any class of citizens, regardless of its strength or influence." After detailing the principal events in the negotiations for a compromise of their differences with the operators, including the part taken by President Roosevelt, the address of the President of the United Mine Workers stated as a result that the officials of the union "came to believe that there had been such changes in the coal trade, or at least in the attitude of many operators, as to justify the hope that there was a possibility of reaching an agreement, provided the joint conventions were reconvened." But upon the Inter-State Joint Conference being called together again, differences of opinion as to the policy to be pursued split the operators into two antagonistic factions. One of these was led by Mr. Francis L. Robbins, of the Pittsburg Coal Company, who favored a restoration of the five and one-half per cent. wage reduction of 1904, while the other faction opposed granting any concessions whatsoever to the mine workers. This dissension among the operators overshadowed the entire proceedings of the Inter-State Joint Conference, while the differences among the mine workers. which at one time threatened seriously to disrupt the miners' organization, were kept in the background if not settled by the tact and genius of the miners' National president. The critical condition in which the negotiations in the anthracite industry were left by the sweeping refusal of the hard-coal-carrying railroad presidents to grant any of the demands of the miners' committee has been slightly relieved by a renewal of correspondence between President Baer and President Mitchell. In this, assurances are given the public that at least one more meeting of the committees of the anthracite operators and mine workers will be held in an effort to arrive at a satisfactory But as the award of the settlement. Anthracite Coal Strike Commission expires on Saturday of this week, it is probable that some action will be taken by the two parties in interest to continue their present friendly relations until the committees can come to some understanding as to the future conditions of employment and wages. At this writing the situation in both the bituminous and anthracite coal industries of the country as regards the future operation of the mines by the members of the United Mine Workers of America is in a most unsettled state. In the meantime the officials of the United Mine Workers are planning another convention of the anthracite mine employees, to which will be submitted a full report of the work of the committee appointed by the Shamokin convention of last December to carry on the negotiations with the operators.

The arrest of the The Western President and Sec-Federation of Miners retary of the Western Miners' Federation on the charge of having been concerned in the murder of the late Governor Steuenberg, of Idaho, was lately reported in The Outlook. In view of the fact that this miners' labor union is charged with having connived in the murder of some thirty men, it is of interest to know that men who are officers and leaders in that union describe its purposes and principles as in some points far more liberal than the labor unions in the East. A correspondent of The Outlook recently had an interview with three of the officers of the Western Federation of Miners, whom he describes as but lately engaged in drilling underground but now called to Denver to manage the affairs of 50,000 union members during the absence of President Moyer and Secretary Haywood. He found them to be theoretical Socialists. In response to his question as to why they were unusually liberal in opening the union to

any applicants, one of them said: "We don't believe that we ought ever to erect any barriers between one workingman and another workingman. The workingman who is excluded from the unions is the man who in the long run will break the unions up. So we take in everybody. We enroll the man who does the mining, and the man who does the shoveling, and the man who runs the engines, and the man who does the common labor, and the man who drives the teams, and everybody who does anything in or around a And we keep the wages of the unskilled man as close to the wages of the skilled man as possible. Where the skilled man is getting three and a half a day, we like to see the unskilled man get about three." And in reply to the suggestion that a greater distinction than this would give the unskilled man a greater incentive to become skilled, the same union officer said: "That is one way of looking at it. You want the men to compete with each other harder. We believe that modern life makes us compete enough anyhow, and we want to see the unskilled man prosperous and happy, because there are more of him than of us after all and always will be, and we must raise him as far as possible toward our level of income or else he will drag us down to his. All workingmen must rise or fall together. That's our philosophy." The fact that the Western Federation of Miners admits members of other unions freely suggested the question, "Aren't you interested in keeping the mining industry to yourselves?" The prompt reply v/as, "No, we are not. We never make any attempt to restrict the number of men who want to learn the mining trade. We have no apprentice system. And we admit without question any man who has a card from any other bona-fide labor organization. You can go to-morrow and get a job in any mine where our organization is strong. You may displace one of our members. We don't care. All that we insist upon is that after you have been in the mine a certain number of months you ought to join our organization. We are not a gang of monopolistic pirates building a stone wall around the mining industry in order to hog all the jobs in it. Our

idea is quite different, and we think it is a better idea. We want all workingmen in the mining industry and in all other industries to be together, whether they are skilled or unskilled, and we think that when you keep a man out of a union you turn him from a workingman into an enemy of the working class. Our idea is that it is only by an absolutely united working class that anything can be accomplished against capitalism. We are not interested in ourselves as miners. We are interested in ourselves as workingmen. Therefore we demand no closed shop contracts with the mine-owners, we impose no restriction upon the amount of work a man may do in a day, we keep no one out through an apprentice system in which the number of apprentices is always made smaller than the number of journeymen, we freely admit the members of other unions, and we pay special attention to bringing the unskilled man up toward the wage-level of the skilled man. The whole idea is a united working class. The man who, because he has a certain kind of skill, separates himself from his unskilled fellows and forms a union for keeping everybody else out and for boosting his own dirty pittance, that man is our enemy. He has deserted the working class and he is helping the employer,"

The difficulty of getting Are "Chattels" natives to work in the Free Men? Transvaal gold mines compelled the mine-owners some time since to import Chinese coolies, who have since been living in the Transvaal as "chattels." In the legal sense of the word this condition may not be slavery. but the condition of "chattels" is certainly not that of free men. Among the Liberal principles upon which the recent electoral campaign in England was conducted, one was that in no part of the British Empire should there be any condition of servitude approaching slavery. to which was added the statement that the condition of the Chinese coolies in the Transvaal did approach such a condition and that a stop should be put to it. When he became Prime Minister, Sir Henry Campbell-Bannerman announced this programme: As soon as a law regu-

lating electoral conditions can be framed, legislatures will be conceded to the inhabitants of the Transvaal and Orange River colonies, and they will then become self-governing without the intermediate step designed by his predecessor; but if the Transvaal legislature chooses to permit Chinese coolies to enter that colony, they shall not lose the fundamental rights of personal freedom-in other words, the rights of free colonists must take second place in comparison with the proper attitude of the home Government regarding the forced levies of labor little better than slavery; furthermore, the Government, while not yet prepared to offer any final solution of the Chinese labor problem, will stop the issue of licenses and will defray the cost of returning to his native country any Chinese miner who may desire to leave South Africa; finally, before the Transvaal is itself in position to legislate, the present "chattel" ordinance as enacted by Parliament will be repealed, so that the colony embarking on its career of selfgovernment shall not inherit an undesirable legacy. In this, Sir Henry's opponents declare, the Government practically reverses the Chinese labor contracts and really claims a veto power against self-governing colonies, a power once claimed by George III. in the case of another colony! The practical question, however, resolves itself into the form of legislature to be adopted in the Trans-If its seats are to be distributed according to population, the Boer or agricultural element will probably predominate; if according to voters, the British or mining element. The question of Chinese labor in the Transvaal, therefore, will be influenced, if not indeed ultimately settled, by the conditions attached to the franchise.

☻

M. Clémenceau's Position

Last week M. Clémenceau, Minister of the Interior in the new French Cabinet, replying to a question in the Senate, tersely expressed the Government's view relative to the employment of force in carrying out the inventories of Church properties. "We

intend to enforce the law," he said, "but the numbering of candlesticks in churches is not worth the risk of sacrificing a single human life." This is construed as indicating that, where resistance is offered, other means than force will be adopted to attain the end. Resistance has been offered not only in the capital, but especially in the provinces of Brittany and Auvergne. At Rennes in the former province certain officers refused to command their troops to enter a church and assist in taking an inventory. Two instances were reported of vicars firing revolvers. Thus fanatical sentiments. controlling ignorant peasants, priests, soldiers, or officials, may easily lead to riot. It will be interesting to observe whether the clever M. Clémenceau can avoid trouble in executing the remaining ten thousand inventories, a work to be accomplished, if possible, in the two months intervening before the national elections. M. Clémenceau's post is certainly more difficult than any other in the Cabinet, and will be doubly difficult if the reactionaries believe that the Pope tacitly approves violent resistance. It is as unfair, we believe, to ascribe this attitude to Pius X, as it would be to ascribe it to Cardinal Richard, the head of the Roman Catholic Church in France, who, though a reactionary in politics, has shown an entire and courteous submission to the new law, thus giving a fine example of citizenship which should have been followed throughout France.

æ

In 1801 Napoleon and Church and State Pius VII., it will be in France remembered, agreed that, in return for payment of salaries by the French Government, that Government should have the right to nominate to vacant episcopal sees. Under the new law, which went into effect last December, abrogating the historic Concordat, the Government will still pay their stipends to the existing priests and prelates, but not to their successors. Otherwise the Government entirely abjures responsibility for the support of the Roman Catholic, Protestant, or Jewish forms of religion—the three forms provided for hitherto by the annual budget of

public worship. The Church property which existed before the Concordat had been signed reverts to the State, but there is a provision that the Government may lease or sell such churches to "associations cultuelles," or local religious associations, which, like secular associations, must, under a recent law, be formed under Government regulations and remain under Government control. These units may be grouped to form larger associations, which, by lease from the Government, may acquire the right to occupy cathedrals and other diocesan edifices. In order to know what the terms of the leases shall be it is necessary to ascertain officially the nature and the amount affected by the law; hence, at the request of the Conservatives themselves, who wanted to protect Church property in every way, the law was framed so as to provide for an inventory.

The new Russian Parlia-The Wretched ment is to consist of two Muzhik Houses, the Upper, the Council of the Empire, and the Lower, the Duma. For the Council, half the members are to be nominated by the Emperor; the other half are to be elected by the provincial zemstvos, or councils, the Church, the universities, the Academy of Sciences, the Bourses of Commerce and Industry, and the nobility. Land legislation is reserved for the Coun-Such a body, so nominated, would presumably be conservative rather than radical. It will be interesting to see how it will deal with measures for the amelioration of peasant land tenure, since these measures must necessarily be rather radical. It is fortunate that it can deal with them at any time, since, even if Parliament be not in session, the Council may meet. Before the serfs were liberated the allotment of land was ten acres to a peasant; but after the liberation this fell to seven Since that time Russia's agrarian population has nearly doubled; there has not only been no increase in land allotments, but there has been an increase in taxation. The result is that the muzhiks or peasants are now in a state of practical bankruptcy, to which has recently been added the further burden of famine

and of the crippled soldiers from Manchuria. The oppressed muzhiks declare that in case this spring does not bring to them new allotments of land, they will plow over the public lands and part of the estates of the nobles, thus signifying that they take possession of these lands in their own right. Two prominent plans for relief are now before the public. The first is that of Count Witte, the Premier. He would purchase lands from the large proprietors through the peasants' bank, with fifteen-year credit bonds instead of cash, reselling to the muzhiks on longterm installment payments. The second and far more radical plan was proposed last week by ex-Minister of Agriculture Kutler, who advocated the expropriation of part of the land of the large proprietors for the benefit of the muzhiks, who, he contends, have a moral right to that portion of the land rented to them, not, of course, to that cultivated by the proprietors. Whatever the solution be, the issue is probably the most urgent of all those in Russia.

The present exhibition A Bit of History of the work of the Society of American Artists in New York City will be the last opened under the auspices of that Society as a separate organization; it will shortly be amalgamated with the National Academy of Design. Mr. John La Farge, in a recent interview in the New York "Sun," speaking as the President of the Society, expressed the opinion that in some respects the present exhibition is the best it has ever had in the width of its range and variety of methods. He commented especially on the influence of Italian masters on the youngest group of men who have been studying abroad. He recalled in a very interesting way the state of affairs at the birth of the Society. Like many other organizations, it represented a movement of protest against conservatism. The Academy, like all academies, had grown conservative. It would have none of Whistler, while the vounger men were enthusiastic in recognition of his remarkable qualities. The feeling culminated when the work of Mr. St. Gaudens and Mr. Chase was rejected and a canvas of Whistler's was

hung over a door and subsequently withdrawn in disgust. The first exhibition of the Society included the work of Whistler, Chase, Inness, La Farge, Homer D. Martin, Thomas Moran, and other artists since advanced into the front rank. This, however, is ancient history. The Society of American Artists has grown to maturity and the Academy of Design has broadened and become more catholic. The two societies have been moving together, and it is expected that their fusion will be commemorated by a great art building which will worthily house the combined societies and become a symbol in the metropolis of the dignity and importance of While the practical arguments for this union are unanswerable, nevertheless the picture-loving public will miss the two distinct annual exhibitions, for which one huge one will hardly be a satisfactory substitute. For, generally speaking, the bigger the collection of canvases the less real pleasure it gives.

3

The Smith Professorship The Smith of the French and Spanish Professorship Languages and Literatures in Harvard University has been the most prominent chair of literature in any American college on account of the character of the men who have at various times occupied it. In the early days, when professorships were few and there was far less specialization, this professorship included the teaching of belles-lettres, and the early occupants of the chair were expected to teach literature as well as the French and Spanish languages. George Ticknor, the first professor, was one of the forerunners of the throng of American students who have since pursued graduate studies in the German universities. He was followed by Longfellow, who was a graduate of Bowdoin, had opportunities of foreign study which for that time were very unusual, and became one of the most accomplished teachers connected with any American university. In due time he was succeeded by Lowell, in whom the special equipment of the professorship—intimate knowledge of literature and feeling for it as distinguished from its philological aspects, knowledge of modern languages, all-around scholarship and teaching ability—may be said to have reached high-water mark. Since the retirement of Lowell in 1866 the chair has remained vacant. The restoration, so to speak, of a professorship which has such associations is a matter of interest to all lovers of literature in this country. A professorship of English Literature now replaces and is in addition to the professorship of Belles-Lettres, hitherto attached to the Smith Professor-To this chair has been appointed Mr. Bliss Perry, the editor of the "Atlantic Monthly." Mr. Perry is a scholar, a teacher, and a man of letters. A graduate of Williams College, attached for a time to its faculty, and later to the faculty of Princeton University, he has been an ardent student of literature, has had ample experience in teaching, and is a writer of growing charm and influence. He has written fiction of excellent quality, and of late years his essays, which have appeared in the "Atlantic" from time to time, have been pervaded not only by a distinct literary flavor which recalls the older days of that magazine, but by a charming humor which is his own. Every evidence of interest in the study of literature as literature in our universities is matter of congratulation; and the coincidence of the revival of a suspended professorship and the appointment of a man of letters to fill it is doubly gratifying.

(8)

It is now over forty years Mrs. Whitney since two of the best stories for girls, stories that have ranked with Miss Alcott's in popularity and have maintained their freshness almost equally, were written by Adeline D. T. Whitney, who died last week in Boston. These two stories, whose titles are, at least with the older generation of living readers, like household words, were "Faith Gartney's Girlhood" and "A Summer in Leslie Goldthwaite's Life." These stories, with, in a less degree perhaps, two or three others of Mrs. Whitney's books, such as "Patience Strong's Outing," "We Girls," and "The Gayworthys," are read to this day, and have thus shown

a power of survival that has not been found in many hundreds of works of fiction which during this period have come to the front, been sold in vast numbers, and then disappeared utterly from view. The reason of this vitality in Mrs. Whitney's best books is that they are wholesome in character, gentle in humor, and friendly and cheerful in manner. they have a little didacticism is not to be denied, but they are far from being sermons in story form, and they appeal in a natural and simple way to girl readers because they represent girl life truly and intimately and are entertaining in a reasonable way.

The Philippine Crisis

In their attitude regarding the control of the Philippines and the Filipinos by the Government of the United States the American people may be divided into three groups.

One group consists of those who think that this control is totally despotic and unrighteous; that we have no moral right whatever to govern the Filipinos; that we gained our domination over them by force of arms, and that all our political acts since the fall of Manila have been tyrannical when not brutal. This group would have the United States withdraw from the Philippine Islands, and allow the Filipinos to take care of themselves.

The second group consists of those who are utterly indifferent to the welfare of the Filipinos. They recognize that the Philippine Islands possess certain material and physical advantages into the possession of which the United States has come by honorable warfare, and think these advantages should be made use of by the American people primarily for their own benefit, and only secondarily, if at all, for the benefit of the Filipinos.

The third group is composed of those who are convinced that the duty of governing the Philippine Islands and their inhabitants was thrust upon the American people by force of circumstances, and was not assumed on their part by any deliberate intention; and that this

duty springs from the evolutionary forces which are developing human civilization on earth. Logically, therefore, this group is unalterable in its conviction that the American people and the American Government are bound to regard the rights and welfare of the Filipinos with as jealous care as their own.

The first group consists of the small but devoted band of "anti-imperialists." Their particular political theories are not, however, involved in the present discussion. In the third group are to be found, we are glad to believe, the great mass of intelligent, fair-minded, and honorable Americans. In it are included, it is needless to say, the President, Secretary Taft, the Philippine Commission, some Senators and many Representatives in Congress. The Philippine crisis to which we allude in the title of this article is this: Shall the majority of the American people, by formal legislative vote, enroll themselves in the second group—that of the selfish exploiters of the Filipinos; or in the third—that of those who believe that the rights and welfare of the inhabitants of the Philippines should receive the same consideration from the Federal Government as is granted to the inhabitants of New York, or Connecticut, or Michigan, or Missouri, or California, or Louisiana, or Virginia?

The opportunity for this enrollment is presented in the Philippine Tariff Bill, now before Congress, which has already passed the House by an overwhelming majority. It is, however, unhappily, held up in the Senate by a few men of powerful political influence, but who, in our judgment, entirely fail to understand the temper of the country.

The Philippine Tariff Bill, admitting sugar and tobacco, the chief products of the Philippine Islands, into this country for three years at one-quarter of the present duty, and at the expiration of three years duty free, is not a piece of quixotic altruism, nor an attempt to make a generous gift to the Filipinos at the expense of our own Treasury. It is a simple act of justice. If, as Secretary Taft has said, we are going to apply the restrictions of the protection theory to the Filipinos, we are bound to give them

at least the benefits of that theory. Under a law already passed, to go into effect next July, we have applied the American coastwise navigation laws to the Philippine Islands; we have forbidden the Filipinos to transport their merchandise to and from their own ports and to and from American ports in any but American vessels. "To restrain Philippine trade," The Outlook said two years ago, "first by laying upon it the weight of a tariff-even if it is somewhat reduced-and then by limiting it to a monopoly of carriers, is to put a double burden upon the islands which we cannot lay on a foreign nation and would never be willing to lay on ourselves."

In this crisis we urge our readers to stand up and be counted. We urge them in every State in the Union to do what a very influential and able body of citizens of Connecticut have done in petitioning their representatives in the United States Senate to vote for the bill. The Connecticut petition is signed by some of the best-known and most consistent protectionists in the United States, and yet it urges "a policy of a square deal for the Filipinos, a policy which would receive an overwhelming majority of Republican votes of Connecticut if submitted to popular approval." The Outlook believes that the policy represented by the Philippine Tariff Bill is supported by an overwhelming majority of the citizens of the United States, but public agitation and the expression of public opinion in mass-meeting, by petition, and by personal letter and telegram, is necessary if certain Senators who appear to be ignorant of the real nature of public feeling on this question are to have their eyes opened.

There is still a word to be said to the protectionist who is sincerely afraid that a reduction of the duty on Philippine sugar and tobacco will open the way to a general destruction of the protective system. Some years ago a campaign advocate of tariff reform in California answered an objector who asserted that a reduction of the tariff was a dangerous tendency toward free trade by retorting: "You might as well say that a man who marries one wife is dangerously tending toward polygamy." If the so-called

great protective interests obstruct the passage of the Philippine Tariff Bill on the ground that it may start the people to demanding a general reduction of our present high tariff, let them remember the lesson which the railroads, the street traction interests, and the insurance financiers have so painfully learned during the last two or three years. corporate interests which by malign and underhand methods fight and temporarily defeat just reforms sooner or later have to endure the effects of drastic legislation the possibility of which they apparently have never dreamed of. Street railway capitalists who bitterly objected to a mild and reasonable payment for long-term and profitable street franchises have now to face municipal ownership as a penalty for their short-sighted selfishness. If the tobacco and sugar trusts defeat the Philippine Tariff Bill because of the fancied danger that it may slightly reduce their profits—although this danger is denied by some of the best protectionist experts of the country—their selfishness, we prophesy, will be punished in the near future by legislation more directly affecting their profits.

We urge, therefore, those who believe first of all in human rights to support the Philippine Tariff Bill on grounds of justice, and advise those who believe first of all in commercial profits to support it on grounds of expediency. To The Outlook it clearly appears that there is no ground upon which any citizen of the United States can justly or safely oppose it.

What Can Be Done

The Outlook commented last week on the present situation in China, with special reference to the feeling of antagonism against America caused by our short-sighted exclusion laws and their drastic application, reserving for later comment the broader aspects of this situation. The Outlook desires this week to indicate some of the measures which ought to be taken at once to foster friendly feeling in China towards the United States. Politically, the Chinese trust us, because we have treated

them fairly: commercially, they distrust us, and that distrust is growing, because we have treated them unfairly. are slow to learn, and nations still slower, that as they do to others so it is done unto them. Secretary Hay laid a broad and solid basis for the most fraternal relations between the Chinese and American peoples, and for a confidence in our disinterestedness which ought to have given us the greatest possible influence with the Chinese. We have again and again demonstrated not only our friendliness but our disinterestedness towards China. We have protested, in season and out of season, and successfully, against the partition of the Empire; we have insisted upon its political independence and its territorial integrity. When excessive claims for indemnity were proposed after the Boxer outrages. we used all our influence to secure a moderation of demands, and with success. In the darkest hour through which the present Chinese Government has passed, when all men doubted and most nations sneered, the United States insisted that there was still a Government of China, and our attitude toward China in those difficult days was determined by our fixed policy of treating the Chinese Government as if it existed, although at the moment it was inaccessible. litically, therefore, China has nothing to urge against us. On the contrary, she has learned to believe that among all the nations with which she has to deal, the United States alone has no ulterior designs upon her territory.

On the commercial side, on the other hand, our unfriendly anti-Chinese legislation and its unnecessarily offensive application in practice have bred a deep and growing feeling of resentment. The Chinese have a right to feel that they have been outraged. We have been in the wrong; and as the first duty of a strong man when he makes a mistake is to admit it and then make such reparation as he can, so pre-eminently is it the duty of a strong nation to reverse a wrong policy and to make confession where confession is necessary to heal the wounds of the spirit. Our first duty to China to-day coincides with policy. It is to remove the causes of irritation. We

must stop treating the Chinese as if they were an inferior people. That is a kind of treatment which we would not stand for a moment if it were offered us by the Chinese, and they ought not to stand it when it is offered them by us. The Chinese do not object to reasonable regulations in regard to the immigration of their own people into this country; they have never objected to the exclusion of Chinese laborers; but they have objected, and they have been right in objecting, to the uncertain phraseology of Congressional legislation and to the offensive manner in which this legislation has been applied to the humiliation of Chinese travelers, merchants, students, and even high officials. The President put the whole situation with characteristic frankness in a few words in his address to the representatives of the American Federation of Labor on Wednesday last when he said:

But I will do everything in my power to make it easy and desirable for the Chinese of the business and professional classes, the Chinese travelers and students, to come here, and I will do all I can to secure their good treatment when they come; and no laboring man has anything whatever to fear from that policy. I have a right to challenge you as good American citizens to support that policy, and in any event I shall stand unflinchingly for it; and no man can say with sincerity that on this, or indeed on any other point, he has any excuse for misunderstanding my policy.

In order to do justice to the Chinese and to change their feeling it is not necessary to repeal the exclusion laws, nor would it, in our judgment, be wise, so far as they are designed to keep out servile labor; but the Exclusion Act ought to be amended in order to make its application to classes more definite and to limit the discretion of the officials charged with its execution. Under the illiberal and strained construction of the act at the commands of our officials, a group of such men as Yung-Wing and as the one hundred and twenty students who came here thirty years ago and more would now be ruled out because they are not of sufficient age. We have excluded from this country the very class of men whose presence we ought to encourage by the most liberal laws and the most courteous treatment.

Years ago a Chinese diplomatist, dressed in the most delicate and beautiful Chinese costume, was crossing a muddy street in San Francisco on a temporary crossing of boards. Some hoodlums, to amuse themselves, reversed the boards and threw the Chinese gentleman into the mud. He scrambled out, made his way as best he could to the opposite sidewalk, turned to the rowdies on the opposite side of the street, and with courteous bow said, "Me heathen, you Christians; good-morning."

The Chinese demand, and we ought to meet the demand, that a certificate from our accredited agents abroad shall in all cases, unless fraud is suspected, constitute a sufficient passport into any American port; that reputation in China touching the character and ability and fitness of our representatives in that country, both diplomatic and consular, shall be very carefully considered by our Government; and that no political consideration shall be allowed to weigh a moment in the selection of our diplomatic and consular agents. They should be, in all cases, personæ gratæ; men, that is, who know the Oriental character, who do not go to the East as the representatives of a superior to an inferior race, but as the representatives of the best in American culture, character, and spirit; and every attempt should be made through official sources, both in Washington and in China, to confirm the Chinese in the opinion that our Government is the friend of the Empire, that we have no ulterior designs, and that our policy of upholding Chinese territorial integrity and independence is not a mask, but an expression of National conviction and purpose. Such instructions ought to be issued to all Government officials dealing with incoming Chinese as to make any repetition of former discourtesies impossible. The Chinese merchant, student, official, and traveler ought not to run the risk of being insulted when he arrives in America, and any blunder of this sort ought to be followed by prompt dismissal of the official who makes it. The necessity of courtesy, consideration, and dignified treatment must be enforced upon all our officials in their relation to incoming Chinese.

The establishment of twenty-five free scholarships for Chinese students in Harvard, Yale, and Wellesley points the way to a still greater and in the long run more influential method of influencing Chinese opinion. Americans must accustom themselves to think of China as she will be twenty five years hence, when the social and economic revolution now going on in that country is bearing its fruits in inaugurating one of the most impressive and probably one of the most significant changes in human history. A great and possibly a terrible force is coming into being. It is for us to decide whether that force shall be friendly or inimical. If we are to make it friendly, we must co-operate with it, and we must make it acquainted with us. A prime duty of the hour is to throw America open to all Chinese who wish seriously to study our institutions and methods of life. A generation ago the main current of Chinese students was flowing toward this country; our shortsighted policy has diverted that current. with the result that now there are said to be five thousand Chinese students studying in Japan and a very large contingent in Europe, and these students on their return, instead of disseminating American ideas and knitting the ties that bind the two countries together, are disseminating Japanese and European ideas. The twenty-five free scholarships in three leading institutions point the way to a broad and fruitful policy. ought to be five hundred or a thousand scholarships for Chinese in America. Every college ought to have its quota of Chinese students; and in the colleges of America the reformers of old China and the leaders of new China ought to be trained. Such a policy carried out for twenty-five years would bind the two countries together beyond all possibility of disruption. President James, of the University of Illinois, proposes that our Government shall send a special commissioner to China, who shall visit the Imperial and the provincial governments, carrying everywhere the most cordial invitations on behalf of American institutions to Chinese students to avail themselves of our educational facilities. would be fundamental statesmanship.

Our colleges can do much; our Government can do more; they ought to cooperate. An indemnity amounting to about twenty million dollars will presently come to this country from China for the Boxer outrages of six years ago. Could not some of it, by action of Congress, be administered by a mixed commission of Chinese and American educators for the purpose of setting the tide of Chinese students once more flowing towards America and of extending American influence in the Far East by bringing young Orientals within the atmosphere of American colleges? We have lost much by the short-sighted policy of the last few years; we can regain everything by a large-sighted policy which shall take into account the brotherly duties of nation to nation, and the fact that, while China is withdrawing itself more and more from foreign power, it was never before so accessible to the right kind of foreign influence.

A Sign of American Idealism

The commercial expansion of the past two generations has left its stamp upon the people of the present. The confidence which a man reposes in his fellows is valued not so much in the abstract as it is as a requisite to business success; ambition is expressed not so much in military exploits as in business enterprise; and devotion to a purpose is most characteristically exemplified by business "hustle" and "stick-to-it-iveness." Particularly in this country are the standards of life expressed in business terms. This was the conclusion which Mr. James Bryce reached after his recent visit to America.

To call this a commercial nation has usually been regarded as equivalent to a severe judgment upon it. This has been to ignore the difference between the outward manifestations of a spirit and the spirit itself. Commercial activity has been confused with materialism. As a matter of fact, there are many signs which indicate that behind this immense development of industry, commerce, and

finance there is a genuine idealism. In particular, religious idealism is evident. This commercial period has compassed the establishment and growth of three of the most remarkable religious orders of all time—the Salvation Army, the Young Men's Christian Association, and the Young People's Society of Christian Endeavor. Of these three one was planted and two have found most fertile soil in this commercial nation: period and country have shown their character, moreover, by responding to that severest of all tests of religious idealism—the summons to engage in foreign missions. Never was the response to this summons more emphatic than at present. In witness to the truth of that statement is the Student Volunteer Movement.

Twenty years ago Mr. Dwight L. Moody invited some college students to Northfield to spend a few weeks in the study of the Bible. Out of the gathering of two hundred and fifty students there has come this movement. Originally simply an unorganized body of men with a common purpose, it is now an incorporated body. Those who make this declaration, "It is my purpose, if God permit, to become a foreign missionary," are known as Student Volun-The organization does not send out missionaries; the Volunteers all go out under their own denominational boards. Allied with this purpose of enlisting recruits for the service is that of promoting in the home land an intelligent knowledge and interest concerning the subject of foreign missions.

Some conception of the extent of this movement may be gathered from the following facts: Up to the beginning of this year almost three thousand volunteers had sailed for the foreign field; one thousand of these have gone in the last four years. Text-books on missions have been prepared, and twelve thousand students in our colleges in over one thousand groups are studying the subject under highly qualified men. It is safe to say that never before have so many men gone forth from our colleges with so broad a view of the forces working for and against the regeneration of the world.

Digitized by Google

Once in a "student generation," that is, four years, the Student Volunteers hold a convention. The latest, held at Nashville (to which The Outlook inadvertently referred at the time under a wrong title), was marked by a characteristic spirit of religious earnestness and idealism. There is something convincingly genuine about the words uttered in a convention whose members are ready to back up their faith by voluntary The confidence which, directed to one end, gives security to commerce was at Nashville a faith in the ultimate world-wide prevalence of the influence and principles of Christ; ambition, which drives some men into constructing great industries, was there the impulse to have a part in bringing that dominion to pass; and devotion to a purpose, which is the secret of success in commercial enterprise, was there manifest in the determination of those four thousand delegates thus expressed to make known to all the world "in this generation" the Good News.

The Good News is something more than the propaganda of a doctrine; it is a message that is told in lives of service to men. That message is conveyed in curing the sick by medical missions, in making the inefficient efficient by industrial missions, and in spreading good will among peoples by missionaries of statesmanlike stature, such as Dr. Arthur H. Smith, of China, Bishop Brent, of the Philippines, and the Rev. Robert Hume, The testimony of Sir Morof India. timer Durand, the British Ambassador, to the high service of missionaries in the East as he knew it at first hand, as well as his estimate of the delicacy and importance of their task, did not too greatly emphasize the variety of gifts which can and ought to be employed in foreign missions. The Student Volunteer Movement is an undertaking to bring into the service of foreign missions men of the highest training as well as religious earnestness. Its success is not only a promise that foreign missions are to have a larger and more beneficent effect upon the world than ever, but also a revelation of the latent spiritual power and religious idealism of this commercial but not materialistic people.

For Public Safety

How many lives were lost in the railroad wreck in Colorado on March 16 may never be known. The officials of the Denver and Rio Grande Railroad, on which the head-on collision occurred, were reported to have issued an estimate of the number; but within a few hours the number of bodies recovered actually exceeded that estimate. The press despatches state the number of lives lost as between thirty and forty.

The accident is said to have been caused by the fact that an operator fell asleep at his post and allowed one of the trains to pass his station without his knowledge. It is said, moreover, that this operator had been on duty for an unusually long period of time. Whether this be true may never be unquestionably ascertained.

The cause and consequences of such a disaster are matters of vital importance to the people not merely of the State of Colorado, but of the whole coun-Safety in travel is not of mere local When a citizen of a Southern concern. State starts from the South to the Northwest, the fact that he passes through Colorado in the course of his journey makes it quite as important to him as to the citizens of Colorado that railway travel in that State should be safe. The inter-State transportation of people is as much a matter of National interest as the inter-State traffic in things. tically all the information that will ever come to the relatives and friends of those who were killed in that Colorado accident will come either from the railway officials (in which case it will be scanty), or from the newspapers (in which case it will be inaccurate), or from the State (in which case its value to a citizen of another State may be negligible). Public knowledge of the causes and consequences of railroad accidents is the first step towards decreasing their number; yet in this country there is no sure and uniform method by which such public knowledge may be obtained.

In dealing with a similar problem England has set an example that we should do well to follow. Under the Regulation of Railways Act, the Board of Trade makes

a report to Parliament on the accidents that occur each year on the railways of the United Kingdom. This report corresponds very generally to the report of the Inter-State Commerce Commission of this country on the accidents that have occurred on American railways. The two reports differ, however, in one respect. That made by the American Commission is based upon information largely derived from the railways. That made by the British Board of Trade, on the other hand, is based upon the results of governmental investigation. Whenever any serious accident occurs on a railway in the United Kingdom, an order is issued for an immediate inquiry as to the facts. We have before us the report of such an inquiry. It pertains to an accident that occurred on the Metropolitan and Great Western Railway in December, 1904. A detailed statement is given of the composition of the trains which collided, of the condition of the engine and the cars after the accident, of the piece of trackage upon which the accident occurred, and of the casualties which resulted. From the facts thus collected by a representative of the nation conclusions are drawn, as from evidence presented in a court of law, as to the cause of the accident and the responsibility for it. The accident was a derailment which occurred on a curve at a place where the tracks of another railway crossed. The engineer of the train most seriously wrecked was shown to be not very familiar with the route. By the testimony of witnesses it was proved that the engineer, or driver as he is called, had asked for an experienced assistant for his run. The inquiry went into such detail as to whether he had requested a "pilot-guard" or a "pilotdriver." It was shown, moreover, that the train at the time of the accident was going at high speed through a fog on a place on the road where the rules required a low rate of speed. An examination of the track showed that the proper elevation of the outer rail on the curve was impossible because of the crossing; and that as a makeshift the rail was improperly elevated so as to be a grave cause The official, Lieutenantof danger. Colonel H. A. Yorke, makes certain

recommendations and points out the desirability of certain specific action on the part of the companies whose tracks join at this point. Out of this single accident there have thus arisen a number of important recommendations: as to the proper form of junction; as to the suitable position for warning signs, or "speed-boards" as they are called; as to special signals for slacking speed; as to stringent supervision over the signing of "road papers" by engineers. consequence of this report the British public is not merely enabled to form a just conclusion as to the responsibility for this particular accident, but is also furnished with a sound basis on which to form a demand for remedial measures to insure protection against similar accidents in the future.

The American public, on the other hand, must at present remain unenlightened as to the cause of specific accidents. and improperly equipped with knowledge that will enable it to demand protection for itself. The sickening accident in Colorado, which cost the lives of six times as many passengers as all the accidents put together which occurred in the United Kingdom in 1904, is consigned to practical oblivion. The record of it will remain in newspaper files, some figures pertaining to it will appear in the general statistics of railway accidents for the present year, the memory of it will occupy a dark corner of the minds of those who survived it and who had friends and relatives who were crushed or burned to death; but, except as certain significant or insignificant details are brought out in lawsuits which may conceivably follow it (and lawsuits are avoided by railway companies whenever possible), this accident will be forgotten; and it is not likely that it will ever be determined how far the railway company, for the sake of increase in dividends, was responsible for keeping the negligent operator too long at his task, for neglecting to equip the road with signals suitable for a singletrack line, and for other causes which contributed to the accident.

Unless we Americans willfully hold life cheap, we ought to be restless and importunate until Congress supplies us with some adequate means for ascertaining the cause and consequences of every railway accident, the responsibility for it, and the practical safeguards which may be adopted against its repetition.

The practical means to this end is the establishment of a Government board which should have immediate charge of investigation and procedure concerning all accidents in travel by land or water.

●

A Lenten Meditation

And then, in his loneliness, all the kingdoms of the world and the glory of them were spread out before the Christ and put into his hand if he would but give himself to the evil spirit. There is less mystery about this temptation than about those which preceded it; it has come more directly within human experience and can be translated in terms of human history. Again and again men have been taken up into the mountain of vision and the vast panorama of empire has unrolled before them, and they have fallen down and worshiped, and lost themselves in gaining a world. To a few noble spirits in such moments there has come a deep and awful sense of responsibility; to more, a giddiness in which they have cast themselves down into every kind of moral lawlessness; to not a few, in that place of awful isolation, there has come madness. So Nero cries in the first hour of his world-wide authority:

"O all the earth to-night into these hands Committed! I bow down beneath the load, Empurpled in a lone omnipotence. My softest whisper thunders in the sky, And in my frown the temples sway and reel, And the utmost isles are anguished. I but raise

An eyelid, and a continent shall cower; My finger makes the city a solitude, The murmuring metropolis a silence, And kingdoms pine in my dispeopling nod.

O wine of the world, the odor and gold of it! There is no thirst which I may not assuage; There is no hunger which I may not sate; Naught is forbidden me under heaven! With a cry.] I shall go mad! I shall go mad!"

Of all the tragedies of life none is nore pathetic than the futile passion of the human creature to grasp and bear

in fragile hands the weight of the world and to drink, through senses filled by shallow draught and worn to exhaustion by excess, the illimitable pleasures of the sensuous life. Under all the trappings of royalty how frail the body of the king, and in the heart of all magnificence how sensitive to any touch of mortality the man whom disease and death can summon with a rude insistence that scorns the courtesies of courts and laughs at the forms of sovereignty!

But the temptation which assailed the Christ was no crude appeal to that love of power which is one of the lower and grosser passions of men. The invitation to fall down before the evil spirit was not a solicitation to lower his aim; it was rather a suggestion to press forward to that aim by a road that would have carried him, as it has carried many a man, to the opposite pole. On the face of it there was no hint of disloyalty to that divine mission already clear in the n.ind of the Christ; in the heart of it there was black treason to the divine will and defeat and overthrow for the divine pur-A thousand legions might have seated the Christ secure on the throne of the world, and every knee might have bowed and every voice cried, "Long live the King;" and the character of the race might have remained unchanged by any moral growth, the redemption of the race unaccomplished, the kingdom of God a mere outward acceptance of authority and not an inward conformity to the will of the Infinite. The Christ saw in the same vision which spread the world before him the two ways that might be trodden. the solid highway through the very center of the world, throngs of men crowding about him, shouts of welcome, flowers all the way, banners waving, ease, acceptance, a crown and a throne; and he saw also the lonely path never far from the places where lights were set in the windows of homes but yet apart from them, crowds beseeching help and then hoarse with imprecations, shouts of derision, palms once but stones many times, desertion, denial, the road to Calvary, the tragedy of the cross!

The temptation that came to the Christ was to take the lower for the higher good, the immediate for the final victory,

the material for the spiritual conquest. In that temptation all men share. spirit of evil has no lure more tempting because none more blinding than this. Among the charms and potencies of evil there is none more deadly than that which was offered to the Christ. The chasm that lies between the lower and the higher kinds of power is so deep that in the ultimate moral vision they stand for principles in deadly conflict. To crave the higher and accept the lower is not only to take evil for good, but to awaken at the end in the bitter humiliation which not only acknowledges defeat but knows that it has been duped, blinded, and cheated, and that the gold which shone afar is but a dust-heap when the end is reached. To follow money, or the authority which rests on force and position rather than moral energy and strength, is to come at last into the court of conscience with empty and often with blackened hands. Among the multitudes who have lost their way in the world none are further from the path of honor, peace, and victory than they who have mistaken the kingdoms of the world for the kingdoms of holiness and have fallen down before the evil spirit instead of worshiping the most high God.

The Spectator

The Spectator is not one of those who spends his substance in riotous theatergoing, and, indeed, the rarity of his visits to the playhouse is such that there is a pleasing hue of expectation shed over all the day preceding one of these unusual dramatic vacations. Consequently he has not learned to put up with the minor inconveniences that to the regular theatergoer have come to be expected and so have lost the power to impress. ably by a dramatic critic, provided he be one who is admitted to theaters, there is little or no thought devoted to how he shall be seated, nor how furnished with a programme and other needed concomitants to play-seeing. He simply goes through an evening at the show as a hardened veteran through a campaign, looking upon the minor inconveniences as merely necessary to distinguish one

campaign from another, remembering, for instance, how during one season he starved for three days and at another was nearly famished for lack of drinkingwater.

The Spectator, having dreamed of a comfortable evening where the intellectual delights of the stage are assisted by the creature comforts of the stalls, is subject to a rude awakening when he substitutes for his roseate fancies the duller hues of reality, and instead of the coziness of imagination finds the hard corners of fact. He is sometimes tempted to wonder whether our theatrical managers and builders of playhouses have not visited the museums, and, after long contemplation of the dismantled ruins of a seat from an ancient amphitheater, reached the conclusion that Greeks and Romans witnessed the triumphs of Euripides and Terence while stretched upon the rack of marble seats. sharp in angles and hopelessly cold and uncomfortable in substance and design. There be prosaic souls who know a spade by its simpler name, and for such the Spectator would inquire by what right theater patrons are made so painfully uncomfortable, although they are expected to pay what (Mr. Howells says) is far too much for their entertainment. The learned critic just quoted took advantage of his oracular position on "Harper's Magazine" to hold a true balance between the cost of a good book that would be a pleasure to a reader during his whole life, and the cost of an evening at a play, which, too often a disappointment, can at best be but a constantly fading memory.

But, without weighing the two forms of pleasure, and admitting that each has its place, the Spectator, while jammed uncomfortably into that marvelously uncomfortable structure known as a theater seat, could not help wondering whether, under Magna Charta, the Bill of Rights, or the Declaration of Independence, he was not entitled to something better than a sort of flapping, trick contrivance that would barely admit his inconvenienced form. Although the

Spectator is of a not unwieldy mold, it is hardly possible for him to remain bolt upright for three hours or more on end, and he occasionally permits himself that swaying which relieves the strain. At such moments a rest for his arm should be ready without the need of expelling from that coign of vantage either his left-hand or right-hand neighbor.

Then, too, the Spectator, in the winter season at least, finds it convenient to assume an outer garment against the inclement weather, and for this there is either no provision or a most inadequate one. It must either be rolled up into an unwieldy bundle and left to rest uneasily against the knees, or else be spread from north to south across the theater seat, to the inconvenience, not only of the occupant, but of the friendly nation abutting on the back.

₩

The Spectator must admit, however, that "the sun do move," for he is, though not aged, old enough to remember when the theater-goer, to be thoroughly comfortable, needed a hat that was a combination of head-covering and foot-muff. There was no place like a hat-rack as a home for the hat. genius, along in the '70s or thereabouts, brought his gigantic intellect to the relief of suffering humanity, and provided a bent wire as an asylum for homeless By some miracle of enterprise this device was adopted, probably because it was cheap. The Spectator regrets the (assumed) early death of this inventor and the absence of any successor in his benevolent work.

6

So much for the creature comforts. *Per contra*, the Spectator must admit that many theaters to-day are well ventilated and well lighted, easy of their exits and their entrances; and this admission is made as a preamble to another bit of pleasant fault-finding. The Spectator, as a lover of literature, protests in behalf of himself and all his kind against the theater programme. He sees no reason why it should be printed upon dingy paper, or any paper that is not

clear and white. It is meant to be read in varying lights. He sees no reason why the claims of advertising should cause the text of the programme to be ground up into minute portions of disjecta membra and distributed over an uncharted sea of type. He is not one to decry the value, nay, even the interest, of modern advertising in its proper place. He believes that much of it is good enough to be attractive reading, and he therefore objects to its introduction as a mere hanger-on to every form of pure reading matter. Spectator admits that as at present issued there may be good business reasons for the hotchpotch programme, but, even without any selfish commercial Interest in the improvement, he would welcome the Napoleon of programme-makers who should cast aside all old traditions and take advantage of the opportunity the need for a bill-of-the-play affords. his mind's eye the Spectator can see an ideal programme, but he is not certain that his readers are yet psychologically ready for the revealment of his vision. It will be enough if by these few briefwords he can succeed in cultivating what Sir Walter Besant called a "healthy discontent" with present conditions.

•

The Spectator regretfully confesses that this is no more than a beginning of the many suggestions he would be glad to make to a really enterprising, thoroughpaced, optimistic theatrical manager, and he believes that fame and fortune beyond the dreams of avarice would await the manager who could put the theater-goer into a delighted frame of mind by a careful attention to all those mere exterior comforts that must precede the proper attitude for the appreciation of dramatic triumphs. The Spectator, if he were to conduct a theater, would even dare omit some brilliancies of the costumer's art, and as much as one novel effect of electric lighting, for the sake of making sure that within his theater his fellowspectators were seated comfortably, with ample room for elbows and feet, and proper places for the stowage of the impedimenta that are the natural adde a of the civilized man.

CHINA IN TRANSITION

SOOCHOW, HANGCHOW, AND THE GRAND CANAL

BY GEORGE KENNAN

Special Correspondent of The Outlook in the Far East

This is the second of two articles in which are described Mr. Kennan's experiences in a house-boat trip through Chinese canals. The first article appeared in The Outlook for March 17—THE EDITORS.

THE things that strike one first and surprise one most in such Chinese cities as Canton, Soochow, and Hangchow, are the narrowness of the business streets and the width of the shop doors. In our cities the streets are always four or five times as wide as the entrances to the buildings, but in China the reverse is the case. The front of a Chinese shop is all door, and its width, as a rule, is two or three times that of the thoroughfare upon which it opens, so that it is really easier to hand a package to a customer on the other side of the street than to pass it to him across the width of the door. Great Dragon Street-the Broadway of Soochow-is only six or seven feet in width, while the doors of the business houses that stand along it would permit the entrance of two carriages abreast. In such streets wheeled vehicles, of course, cannot be employed, and goods of all kinds, from garden vegetables and dressed hogs to furniture, building materials, and bales of silk, are suspended from shoulder-poles and carried by coolie porters. Animals are not much used for the transportation of merchandise. on account of the lateral space necessarily occupied by pack-saddles and packs. Two laden pack-horses could hardly squeeze past each other in the street of the Great Dragon, and pedestrians are often compelled to step into the shops in order to get out of the way of passing files of coolies carrying bulky goods. Although a large part of the heavy merchandise of Soochow is distributed by means of the canals, enough goes through the streets to make walking

along them in a straight line absolutely impossible. Progress from one point to another is made by a series of dodges, with an occasional jump into the open front of a shop or a plunge into a side alley, in order to avoid a donkey train, a funeral procession, or the palanquin of a mandarin.

The business thoroughfares of a Chinese city are less noisy than ours, because there is no rumble of wheels over the pavements; but the air is filled from morning to night with cries of warning from the hundreds of coolies who are constantly passing to and fro with boxlike palanquins slung on long poles, or with heavy loads of rice, silk, tea, roofingtiles, firewood, timber, machinery, books, crates of fowls, immense white radishes, bales of straw, or five-gallon tins of American kerosene. Nobody gets run over, because there are no wheels; but everybody who cannot dodge with agility gets squeezed, hustled, or bumped. For this reason an inexperienced foreigner who wishes to explore the streets of a Chinese city will do well to mount a donkey, or hire coolies to carry him in a sedan chair. As Soochow donkeys are not equipped with side-saddles for ladies. and as, moreover, they are generally so small that a long-legged man can stand astride of one without touching the saddle, we decided to take chairs; and at three o'clock, when we came out from lunch at the Soochow Episcopal Mission, four chairs and twelve coolie bearers were waiting for us in the compound.

A Chinese sedan chair is a roofed and curtained box three feet and a half high and two feet square, hung between two

long and springy shoulder-poles. As a vehicle—if vehicle it may be called—it is not altogether uncomfortable; but when, after you have entered it and taken your seat on a small cushioned shelf, your bearers lift you from the ground and trot away with you, you feel like a Brobdingnagian Punch being carried in a Lilliputian Punch and Judy box to a country fair where you are to be exhibited for the entertainment of the populace. Every chair has two bearers, and a third coolie walks alongside to relieve or "spell" his comrades by turns as they get tired. The men all groan or cry out at short intervals as they march, in order to warn the public that a palanguin is coming; and when a procession of chairs happens to meet a train of donkeys in a congested street, the air is filled with the yelling of the bearers and the jingling of strings of sleigh-bells hung around the donkeys' necks. all pedestrians seek temporary refuge in the shops, leaving the street to the donkey-riders and palanquins. These may be able to pass one another without coming into collision; but while they are doing so foot-passengers must content themselves with "standing room only" in some out-of-the-way place.

Three-quarters of a mile from the Episcopal mission we stopped for half an hour to examine the great Soochow pagoda—one of the most noteworthy monuments of antiquity in all the Chinese Empire. It is a massive octagonal tower of masonry, three hundred feet in circumference at the base and two hundred and fifty feet in height, with nine stories, an equal number of spiral stairways, and more than sixty doors opening upon the nine outside galleries or verandas. It contains two hundred altars or shrines, behind which sit two hundred stone idols of various ethnological types, all of them ugly, and many of them combining a gilded body with a smirking East Indian face and kinky African hair painted sky-blue. The dusty and neglected condition of the shrines when we saw them seemed to indicate that the Soochow people had little respect for their gods; but that fact, perhaps, should not excite surprise. If I had inherited from my ancestors a lot of deities whose kinky hair was sky-blue, and whose faces had the expression that a cat's countenance assumes when it has finished a bowlful of cream in the pantry, I'm sure I shouldn't dust their shrines every morning, nor try to propitiate them with offerings of candles and rice. A smirking, yellow-bodied, blue-headed negro may excite curious interest as a lusus natura—a sort of ethnological freak—but he cannot be an attractive or aweinspiring object of worship even to a Chinaman.

The view from the highest story of the Soochow pagoda over the extensive city with its network of canals, and the great environing plain dotted with villages, crisscrossed with intersecting waterways, and thickly set with small shining lakes and clumps of leafy trees, is extremely beautiful and attractive. Within the limits of vision there are thirty or forty market towns, and perhaps fifty thousand villages and hamlets, containing a population of two or three million souls. Through this fertile and populous country runs the Grand Canal, which, with its scores of lateral branches, links together thousands of villages and towns and connects them all with the Yangtse River and Shanghai.

Descending from the pagoda, we took seats again in our chairs, and were carried through a labyrinth of narrow, dirty streets to the Wan-Miao-Kwan, or City Temple—an extensive group of buildings filled with gilded and blue-haired idols of all sorts, sizes, and degrees of ugliness. The rather spacious courtyard in front of this Taoist place of worship had been turned into a great market, or fair, where half-naked jugglers twirled dishes on sticks, or pulled hanks of burning tow out of their mouths, for the entertainment of the multitude, and where petty traders, standing in flimsy booths or squatting on the ground, sold toys, confectionery, curios, Oriental trinkets of trifling value, candles to be lighted in front of shrines, and paper imitations of gold and silver coins, which, when burned in big iron braziers, are supposed to enrich the ancestral dead by going to their credit in some celestial bank. Several thousand taels were thus transferred from one world to the other while we watched. and the total expense to the remitters did not exceed fifteen cents Mex. China could only pay her priests in the same currency, she would save, in a year or two, money enough to liquidate the Boxer indemnity. Unfortunately, however, paper-gilt coins that are good enough for the spirits of the dead in the Chinese heaven are not good enough for the spiritual directors of the living on earth. The latter may encourage their parishioners to put off paper money on ancestral ghosts who can't refuse to take it, but they insist on having their own salaries paid in the round brass baggage-checks known to the Orient as "cash.'

Leaving the Wan-Miao-Kwan Temple. we went through some of the busiest streets of the city, where streams of pedestrians were so intermingled with palanquins, donkeys, and freight-bearing coolies that it seemed almost impossible for anybody to make progress in any The inhabitants of Soochow, direction. however, are used to six-foot streets. and, with oft-repeated shouts, cries, and groans, they dodge one another, evade one another, and get around one another's chairs, animals, and burdens, with perfect good temper and with a surprisingly small amount of friction. Such a jam of people, beasts, and merchandise in a street of New York or London would require police intervention and direction, but in China—outside of Peking—I have never seen a policeman attempt to control a municipal crowd or regulate street traffic. The people manage, in some way, to keep in motion and take care of themselves.

In a particularly congested part of Great Dragon Street we happened to encounter a long funeral procession, and in order to get past it at all we had to crowd the mourners, hustle the priests. and force the pall-bearers and coffin into a side alley; but nobody seemed to take exception or feel aggrieved. When a train of palanquins meets a funeral procession, there must necessarily be some confusion and disorder; but as the jam is due to the way in which the city has been laid out, and not to personal carelessness or aggression, it is regarded with tolerance and good temper as an inevitable accident.

Although I had seen Chinese funerals before, this one presented some features that were new to me and that struck me as curious and interesting. At its head marched three or four musicians—or, to speak more accurately, charivari performers—pounding on gongs and making a strange, deep-bass hooting by blowing into short, bell-mouthed funeral trumpets. The priests, who followed, were dressed in white, as were also the mourners, the musicians, the bearers of white-frosted funeral cakes, and the acolytes, who carried artificial stems and blossoms of white The coffin was covered with a white pall, and the members of the bereaved family not only were clothed in white, but were inclosed in a rectangular screen of white cotton sheeting stretched around four supporting corner poles. This screen, which was carried by four white-robed boys, made a sort of quadrilateral pen inside of which the chief mourners walked. There were none of the white, inscribed, table-knife-shaped flags which are so noticeable in Japanese funeral processions; but my memory retains a vague impression of men carrying white umbrellas, inscribed wooden tablets, and slender rods wound spirally with strips of white cotton cloth. confusion and disorder were so great as we passed the procession that many details doubtless escaped my notice.

When we got into a less crowded quarter, we alighted from our chairs and walked half a mile or more through narrow streets lined with open-front retail shops for the sale of jade, furs, silver ornaments, elaborately carved furniture, bronzes, curios, metal water-pipes, opiumsmoking apparatus, brass implements and utensils of various kinds, books, drugs, coffins, porcelains, embroideries, and silks. Most of these things are manufactured in Soochow, without power machinery, in small individual workshops, and by artisans whose wages range from ten to twenty-five cents per day. larger silk stores are said to carry in stock nearly a hundred varieties of satin and satin brocades and two hundred different kinds of silk and gauze, all woven on foot-power looms, and nearly all in the homes of the weavers. embroidery is another great industry of

Soochow, and gives employment, in and about the city, to more than one hundred thousand women and girls, who are paid for their work at the rate of from three to eight cents per day. When one takes these wages into consideration, one no longer wonders at the cheapness of the beautifully embroidered Manchu and mandarin coats and robes which are offered for sale by merchants and hotel peddlers in Shanghai, Tientsin, and On a piece of embroidery that Peking. sells in Shanghai for twenty dollars, gold, a woman may have worked for three months; but five dollars would probably represent the labor element of cost, leaving fifteen dollars for cloth, silk thread, and dealer's profit.

Late in the afternoon we bade Mr. Ancell good-by and returned to our house-boat, just in time to see a wedding junk, with bonfires at the bow and red banners overhead, carrying a bride to the house of the groom, amid the popping of firecrackers and general excite-All the great ceremonies and sacraments of life in China are made noisy with firecrackers or gongs. man cannot even pray without blowing, beating, or exploding something, to call his god's attention to the urgency of his supplication; and the more noisy a wedding or a funeral can be made, the more profound seems to become the Chinaman's consciousness of its importance or solemnity. If, on his death-bed, he could be assured that his body would be accompanied to the grave by a bassdrum corps, a steam calliope, and a battery of machine guns in action, he would undoubtedly close his eyes peacefully and die happy. An improved and enlarged phonograph, which would reproduce faithfully and with adequate volume a general bombardment of Port Arthur, might be sold by the ten thousand in China for use at weddings and funerals and as an accompaniment to prayer.

In order to escape the incessant chatter of voices from the scores of house-keeping boats in the basin where we were moored, we moved out, just before dark, and, poling southward through the moat to the Grand Canal, we tied up to the bank in a quiet place near the Pan-

Men Gate, where there was a rakish, highly varnished police boat to protect us from river pirates, and where we were not likely to be disturbed by noise. There we spent a peaceful night, and on the following afternoon we took a tow for Hangchow by the famous Grand Canal.

The Grand Canal of China is one of the oldest artificial waterways in the world. The part of it which connects the Yellow River with the Yangtse was dug in the era of the Han Dynasty, 1700 years ago; the section from the Yangtse to Hangchow was completed by the monarchs of the Sung Dynasty a few centuries later; and the whole canal, as it now stands, was in existence more than a hundred years before the discovery of America. As an engineering work it is among the greatest achievements of man, inasmuch as it has a length of 650 miles—a distance almost equal to that in an air line between Washington and Chicago—while for scores of miles at a stretch it has a width of from one hundred to three hundred Beginning at Hangchow, it runs northward, nearly parallel with the coast, to the Yangtse; crosses that river and the Hoangho; traverses the wide, fertile plains of Shantung and Pechili; and finally opens into the Peiho near the great commercial port of Tientsin. With its hundreds of lateral branches and feeders, it probably links together two or three hundred thousand cities, villages, hamlets, and towns, and covers with a watery network all the eastern part of the Empire. I suppose I had read descriptions of this canal before I came to the East; but when we left Soochow and found ourselves in a deep, bluish waterway hundreds of miles in length, and twice as wide as Pennsylvania Avenue in Washington, I realized that my reading had been of little use to me, because it had given me no adequate idea of the stupendous magnitude of the work.

Although the Grand Canal, in the vicinity of Soochow, runs through a flat alluvial plain, the scenery along it is never monotonous or uninteresting. There are always leafy trees enough to give softness and variety of form to the shifting landscapes; large, golden-yellow flowers,

tapa.

which look like marsh marigolds, fringe the shore at the water's edge; bean vines climb over the shrubs on the banks and cover the dark-green foliage with a lighter embroidery of delicate sprays and snow-white blossoms; quaint villages, with a slender pagoda in the background, appear here and there at the mouths of narrow, tree-embowered lateral canals; and near at hand or far away there is always a high, curving stone bridge, whose proportions and outlines are a delight to the eye. But the canal itself is even more interesting than its banks. It is never yellow or muddy, as canals almost always are with us, but presents, under a clear sky, the bluishgray color of a deep, uncontaminated river; while the boats that it carries are a never-failing source of entertainment and interest. There may be, somewhere, a greater variety of water craft than one can see on the Grand Canal, but I should not know in what part of the world to look for it. Immense junks of highly varnished natural wood, with low bows and preposterously high sterns, come plowing along before the wind under towering, russet-brown lugsails seventy feet in height, crossed by twenty-five or thirty bamboo battens; while directly behind them you may see, perhaps, a small, "north-of-the-Yangtse" sailingsampan, in which a solitary man works a broad-bladed paddle with his feet, steers with one hand and manages half a dozen sheets with the other. vou have finished looking at a mandarin's house-boat, with its ornamental carving, its cabin windows of translucent shell set in little wooden squares, and its long, crooked sculling-oar swaying back and forth in the grasp of four powerful rowers, your attention is suddenly distracted by the open skiffs of three or four cormorant fishermen, whose birds, to the number of thirty or forty, sit perched on the gunwales, waiting for the rings which are put around their necks to prevent them from swallowing when they are sent to catch fish.

After you have seen sailing-sampans, foot-power sampans, cormorant fishermen's skiffs, mandarins' house-boats, long trains of crowded passenger-boats towed by steam tugs, huge wall-sided

grain-boats with wide-open painted eyes glaring at the water from the bows, and innumerable junks of all sizes, shapes, and descriptions, you think, perhaps, that the possibilities are exhausted—that you are familiar with every type of boat used on the inland waters of the Orientbut you are almost sure to be mistaken. I came to that conclusion at the end of my first day's experience; but early Thursday morning, before it was fairly light, I was awakened by a curious rapping and scraping along the sides of the boat, and upon going out on deck I found that we were running between two parallel fences of stakes and ropes, set up in the water so as to inclose and protect what looked like areas of pond-lily leaves, extending for half a mile or more along the sides of the navigable channel. In these lily plantations forty or fifty men, women, and girls were paddling about in big round wooden tubs, some of which contained small charcoal fires. What these people were doing with fires in floating wash-tubs, at that unearthly hour in the morning, I could not possibly imagine, and as it was not yet light enough to see anything distinctly, I was unable to satisfy my curiosity. Before sunrise, however, I had discovered that they were picking from under the big peltate leaves small green pods, which, when I had an opportunity to examine them, proved to be the fruit of the aquatic plant known to botanists as Trapa bicornis. The kernels or seeds in these pods are good to eat, and thousands of acres of water along the sides of the Grand Canal, and in the shallow lakes communicating with it, are devoted to the culture of the plant that produces them. The charcoal fires, which, in the dim gray light of early morning, added another element of mystery to the doings of the ghostly figures in the floating tubs, were used, doubtless, as a means of warming hands that had become chilled and benumbed from long groping The fact and dabbling in cold water. that these pod-pickers were in their tubs at the first gleam of dawn shows conclusively that getting a livelihood in China is, for the farmer, a strenuous business.

As we approached Hangchow, Thursday afternoon, the scenery became more

rugged and picturesque, and the broad canal, winding around high, bush-covered hills, carried an ever-increasing number of cargo-boats, fishing-boats, sampans, and junks. At the Imperial custom-house, on the outskirts of the city, we cast off our tow-line, and sculled slowly, for a mile and a half, through a great extramural suburb, past floating boat dwellings, where canary-birds were singing over wooden tubs of blossoming plants; past household junks in which women were cooking, spinning, or reeling thread while their husbands rowed; past open tank-boats filled with masses of semi-liquid fertilizer which poisoned and polluted the air; past temples with turned-up corners, where worshipers were buying candles and burning strings of paper money; past markets filled with dealers in pork, vegetables, Trapa bicornis pods, apples, oranges, and grapes; and at last into a stretch of open water between a temple and a camel's-back bridge, where we finally tied up to a grassy bank strewn with corpse-filled coffins which, apparently, had been lying there awaiting burial for many months.

I have never been able to ascertain with certainty why the Chinese, in this part of the Empire, leave the bodies of their dead lying around on the banks of canals, or in out-of-the-way nooks and corners of waste land, instead of putting them decently under ground. In the northern provinces—and especially in Pechili—any old field seems to do for a cemetery, and the small conical mounds of earth which mark the resting-places of the dead are frequently scattered all over the cultivated land; but there the coffins containing the bodies are at least buried, while in the vicinity of Hangchow they seem to be dumped anywhere, and left on the surface of the ground to be defiled by beasts or reduced to decay by weather, and the lapse of time. One fails, absolutely, to enter into the thoughts of an ancestor-revering Chinaman who leaves the body of his father in a dirty. dog-infested rubbish-corner on the bank of a canal, where it has neither protection nor care, and then goes to the nearest temple and burns half a dozen strings of paper-gilt coin, in order to furnish that father with pocket-money in the

kingdom of heaven. I used to think that the desire of a Chinaman to be brought back from a foreign land after death and buried in the God's acre of his ancestral home was rather a touching thing; but my observations on the banks of the Grand Canal and in the fields around Hangchow have modified my view. There were seven unburied bodies in weather-beaten coffins within fifty feet of the place where we tied up to the bank for the night, and we saw dozens more in weed-overgrown fields on the outskirts of the city.

We remained in Hangchow until Saturday afternoon, and explored in sedan chairs many miles of narrow, crowded, inconceivably dirty streets both inside and outside of the city wall; but we saw nothing of interest that we had not already seen in Soochow. The Sihu. or Western Lake, which lies among the hills a short distance from Hangchow, is a picturesque sheet of water, but we had time only for a glance at the temples, pagodas, monasteries, and Imperial pleasure gardens, which give variety and architectural beauty to its grassy slopes and boldly projecting promontories. Leaving Hangchow for Shanghai by the regular boat-train late Saturday afternoon, we steamed through the Grand Canal all night, and arrived at Kashing early the next morning. When I went on deck, after breakfast, we were just entering upon a great, flat, cultivated plain where it seemed to have been raining coffins for forty days and forty nights! The banks of the canal were lined with them, and they lay sprinkled over the fields as far back as the eye could reach. I think it is not an overstatement to say that there were a hundred to every square mile, and most of them had no other covering than a layer of reeds or dried grass. The only explanation I can suggest of this wholesale exposure of coffins in open fields is based on the tyrannous force of the preposterous superstition known to the Orient as "fengshui." In China, as in Korea, it is universally believed that the place selected for the burial of the dead controls, for good or evil, the fortunes of the living. Beneficent or calamitous streams of influence are supposed to flow

from the graves of dead ancestors, and the topography of the ground in which a corpse is laid determines the luck of the surviving family. As the common people are ignorant of the conditions upon which good or evil fortune depends, they are forced to consult professional "ground doctors," or geomancers, who, after pretending to make a survey of the country, select for the grave a place where the "green dragon" current and the "white tiger" current of spiritual influence are free to run in the proper direction. These ground doctors, of course, are not in the business for their health, and if a family which has lost its head by death is unwilling or unable to pay the fee which the geomancer asks for picking out a lucky grave site, it must either leave the corpse unburied or run the risk of bringing terrible calamity upon itself by putting the body under ground in a place where the "fengshui" is unpropitious. The easiest and cheapest way to escape from this dilemma is to set the coffin out in a field and leave it there until the family gets richer or the ground doctor abates his terms. The Chinese are supposed to be a reasoning as well as an ancestor-loving and ances-

1906

tor-revering race; but after seeing the way in which they disposed of their dead, I modified my view of their intelligence and wholly lost my faith in the sincerity of their love and reverence for their ancestors. If they had the brains of a Siberian Korak, they would not believe in "ground doctors" or "fengshui;" and if they really loved or cared for their fathers as civilized race. do, they would pay some little honor to their bodies after death, and not deal with them as the Cubans in Santiago used to deal with fever-infected clothing.

Late Sunday afternoon we passed out of the canal into the Huangpu River above Shanghai, and between nine and ten o'clock that evening we reached the city and returned to our hotel, after an absence of seven days. The expenses of our week's trip were \$228.46 Mex., or \$114.23 gold, including house-boat, equipment, provisions, the wages of eleven men, and the charges paid to tugs for towing us nearly four hundred miles. A party of four persons might easily make a house-boat trip of a month at a cost of \$4 a day per capita, and thirty days could not possibly be spent in China more comfortably or more pleasantly.

THE AMERICAN TEACHER IN THE PHILIPPINES

BY JAMES A. LE ROY

Author of 'Town and Country in the Philippines," etc., etc.

O much contradictory testimony is published as to the nature and probable results of the work done in the American schools in the Philippines that really first-hand, competent testimony gains special importance. A good deal of what passes for competent discussion of the Philippine school work is written by whilom sojourners, some of whom have not been near a school-house in the islands. Other contributors, claiming to have been visitors to these schools, have nevertheless told to the readers even of our serious political reviews incidents and class-room conversations

therein which fall under the category of things "interesting if true." One such story has been circulated as an antiimperialistic document. An undue proportion of the articles written for American periodicals by American schoolteachers in the Philippines have been written by the sort who proved uncongenial or unfitted for the work, and have within the past few years been weeded out of the teaching force, voluntarily or involuntarily, returning to the United States, therefore, in a critical mood.

The teachers in the Philippines who have been in the work since 1901—some

of them even longer, beginning back in the days of the military government - now call themselves the "Old Guard." They are yet young in experience in the Philippines, as real experience in an environment so different from that at home should be regarded. But they are of the sort who proved to have the necessary staying power and the right qualities and disposition; and they have now, as it were, caught their "second wind" in the matter of opinions upon things Philippine and Filipino. Testimony from these men and women is the most valuable of all; no one of them has had the experience to enable him to survey the whole situation comprehensively; but, on the other hand, each one can give detailed testimony that comes most intimately close to the truth regarding conditions in the islands. They, of all Americans, have come closest to the masses of the Filipino people.

Some extracts from an article contributed to "The Philippine Teacher" by E. J. Albertson, a teacher who has had almost five years' experience in the schools of Misamis province, are of interest and value to every American who takes a concern in the broader aspects of the "Philippine question." It should be said, by way of preface to these extracts, that Misamis province lies on the northern coast of Mindanao, and comprises a sort of fringe of mostly poor and little towns of Christian Filipinos (Bisayans, in the main) lying next to the unexplored interior or to the territory of the Moros. Naturally, this was a rather backward portion of the Philippines when American occupation began, and hence not the most favorable region for prog-It should be said also that Mr. Albertson is speaking primarily of the Filipino masses, not of the few aristocratic families whose manner of living was altogether more pretentious. I select only the most significant paragraphs of this article:

Old established customs of the home that we regard as superstitious and queer are gradually giving way to modern ideas. Rarely does one now encounter, upon paying a visit to the home of a pupil, that cold, foreign attitude of suspicion on the part of the parents and other members of the family that formerly characterized such occasions.

. . . Instead, we now begin to see the young people and parents receive their visitors with perfect ease and cordiality. The visitor does not so frequently have to gain the good will of the two or three bony dogs, fighting cock, or family pig at the entrance to the Filipino home as was formerly the case. These pets are gradually being dispensed with, or are being relegated to their proper places. Nor does one have to pass over a stained floor, hang his hat on a dust-covered hat-rack supported by cobwebs, or seat himself in 2 greasy, dirty chair that at once puts a finishing touch to his suit of clean white clothes, so frequently as before. Instead of saddles and fish-nets, he finds on the walls pictures and drawings, made, perhaps, by some member of the family. The furniture, what there is of it, is arranged with some degree of taste, and odds and ends are not found hidden in half-secluded nooks.

In the matter of cooking, eating, and sleeping perhaps the greatest changes have been wrought. First of all, pigsties and chickenroosts are being removed from the kitchen, better facilities for cooking are being substi-tuted for the old ones, dining-tables, with tablecloths, are gradually coming into daily use, and the practice of eating the food from the floor is becoming less common than for-The practice of the whole family eating from one common dish is being discontinued in many families, and greater use is being made of knives, forks, and spoons. Where it is possible, the family occupy two or more sleeping-rooms instead of the one large one, as was formerly the custom. And the people are learning the desirability of using beds instead of the floor for sleeping purposes. Nor are all the windows of the bedroom closed tightly at night, as was formerly the case. Thanks to the lessons learned in hygiene classes, the children are persuading their parents to pay more attention to the matter of ventilation.

Permit me to quote an instance of the changes that are going on. One of the students who is attending our provincial school is a Chinese mestizo. He is boarding with Chinese relatives. I have known him for more than four years, and can say that I had never seen a more unkempt, mannerless person than he appeared to be the morning I first saw him, standing in the store of one of his Chinese relatives. I recently had occasion to pass by the boarding-house of this young man, and what I saw in his room was indeed in marked contrast with the surroundings. Shelves and decorations were on the walls. There was a place arranged for everything he used. His mirror, tooth-brush, water glass, bookcase, etc , were all found to be conveniently and artistically placed. This boy, during the past two years, has changed from a rough, ignorant, and ill mannered fellow to a neat, care-taking, and observant student. He exerts a great influence for good on his fellow-students. Out in the province, in his home, is found the stamp of the American schools. Pictures and fancy needlework

adorn the walls, and the home in general is well ordered. If schools can work such a change for good in such a home, how much more may we hope for in the purely Filipino home?

. . Schools are teaching the Filipino people to appreciate the dignity of manual labor, which fact is manifesting itself most forcibly in the home. Where in past years the [betterclass] Filipino home was overcrowded with slaves, who were made to do all the housework, we find the sons and daughters in many families now doing this work. An American teacher setting up a half-dozen pieces of hyloplates, or carrying a couple of large packages of books home, or a lady teacher, with her sleeves rolled up, doing some ordinary household duty, have demonstrated to the Filipino boy and girl that manual labor is not for some, but for all; that instead of shunning work because it is undignified, we should cling to it for the joy it gives. In many of the homes of our pupils the girls are doing their own washing, ironing, sewing, and even making their own clothes. In families where there are several daughters they alternate with each other each week in directing the household work. . . . Boys in many of the better homes have ceased to be ashamed to carry water and do other chores about the home, as is done by boys in America. In cases where parents of the school-children of the towns own farms near by, it is not uncommon in these days to see boys, who during the week are attending the high school, wearing perhaps fine clothes and patent leather shoes, out on the farm Saturdays following the plowed furrow and urging along the slow carabao. For those critics who are trying to decry the system of education as now established in these islands, because it is not a practical one, because the schools are turning out young men and women who are averse to manual labor, such examples as I have mentioned ought to be sufficient, it seems to me, to prove how unsubstantiated are their charges. It is no uncommon sight to see school-boys dressed in working clothes building fence out under a hot sun, or pulling weeds in the school garden, or working on some building to be used in connection with school work. Nor is it uncommon now to see Filipino girls working in the garden or taking outdoor exercise, either by engaging in games or going through gymnastic drills.

We should assume, without going further, that this is the sort of American teacher in the Philippines who is, as the writer says the teacher should be, "a broad-minded, tactful, generous, and approachable neighbor, rather than John Smith, American teacher from New York,

sojourning in the Philippines." This is the sort of a teacher who, while firmly maintaining the necessity for instruction in English in the school-room as the proper means for broadening the horizon of the whole coming generation of Filipinos, yet does not in the least despise the native dialect, nor underestimate its vigor and tenacity of life, and who, on the contrary, promptly learns it, that he may the better put himself en rapport with his pupils and their parents, and may understand their mental processes the better also. This is the practical American teacher in the Philippines, and these comments of his are but a mere hint of the many ways in which such men and women are having influence in the Philippines. He paints no mere enthusiast's picture of a day in the future, but speaks of things as they are:

I do not mean to have it inferred that what I have just said applies to all Filipino homes, or even half of them. I do not want to be understood as saying that a great proportion of the school-children throughout the archipelago are taking so strenuously to work. No, the percentage is probably small. But what I do wish to emphasize is the fact that in almost every town in the archipelago there is found a considerable number of young people who have acquired or are acquiring the proper attitude toward manual labor; and it is in the Filipino home that this newly acquired idea is first being put into practice.

It should be said also that the schools are having, both directly and indirectly, an influence in improving the diet of the Filipinos. Where there were army posts the people often learned to like canned salmon and other articles of the commissary supply, above all others the soldiers' white bread. The American women teachers, and sometimes the men as well, have often been called upon to initiate the people in bread-making, cakemaking, and the use of baking-powder for various articles of food. Not a few of the women teachers are virtually cooking-school instructors outside of regular hours, and wheat flour, formerly unknown in most of the towns, is coming into use.

CHICAGO'S STRUGGLE FOR FREE-DOM FROM TRACTION RULE

BY GEORGE C. SIKES

Since this article was written a great victory has been won for the city of Chicago in the traction struggle by the decision of the United States Supreme Court retusing to place upon the so-called ninety-nine-year act the interpretation set upon it by the traction companies. This decision was summarized and its effect described in The Outlook last week. The reader of the present article will be interested to know that its author has been a special student of this question for over ten years, and has had occasion, as a newspaper correspondent and editorial writer for the Chicago press, to watch the traction struggle at close range. We may add that Mr. Sikes was in 1890 made Secretary of the Street Railway Commission (really a special committee of the City Council on this subject), and held that office for over two years; while later he was associated with Mr. B. J. Arnold in the preparation of an elaborate engineering report on the traction question.—The Editors.

"HE socialistic movement (so called), which seems now so rampant, is due more to the determination of the people to boss the situation than to any economic principles or socialistic dogmas—a determination to subdue corporations drunk on ill-gotten wealth. For this feeling the special beneficiaries of governmental policies have only themselves to blame."

This statement of Lyman E. Cooley, the well-known engineer, in a recent talk on public ownership to the Western Society of Engineers, aptly characterizes the municipal ownership movement in Chicago. That movement has been and is still primarily political. It is at bottom little else than an effort to restore and maintain democratic government. To begin with, it was not a municipal ownership movement at all. Ten years ago the people of Chicago demanded only a fair franchise settlement. Balked in that, and angered at the continued attempts of the traction companies to secure control of the government, both State and local, in order to force upon the community an unfair franchise settlement, public sentiment has moved steadily forward, until to-day Chicago is committed to municipalization at the earliest time at which it can be brought about.

There is nothing so amazing as the stupidity of men who will not see. The obtuseness of the Chicago traction magnates is to be likened only to the blindness of the beneficiaries of the old

régime in the days immediately preceding the French Revolution. Ten years ago twenty-year franchise renewals, with no limitations of consequence, could have been had with comparatively little effort. Yerkes demanded fifty-year grants, and, in order to accomplish his purpose, deliberately set out to debauch the government of State as well as city. This daring challenge furnished the shock that was necessary to arouse the people. In this sense Mr. Yerkes may be said to have done more than any other one person to bring about the political regeneration of Chicago. When the companies got ready to take twenty-year grants, public sentiment had moved on and demanded the imposition of new conditions. While they hesitated and tried to drive a better bargain, public sentiment moved forward Thus the companies have always lagged two or three years behind the steady onward march of public opinion, manifesting a willingness to accept, when too late, terms that could have been secured somewhat earlier. I verily be lieve it is absolutely out of the question for the existing companies to secure today franchise renewal grants of any kind whatever. So angered are the people that they will allow their city government to have nothing whatever to do with the old crowd, except to buy their property if it can be had for a reasonable price.

The present situation can be better understood if traced from the beginning. In 1858 a franchise for horse-car lines

was conferred by the Council upon a group of men who shortly afterwards became incorporated as the Chicago City Railway Company. The grant was for twenty-five years, and thereafter until the city should elect to purchase the tangible property. In the next few years similar grants were made to other companies to occupy the North and West divisions of the city, the City Railway Company confining itself to the South division. Thus was early established the policy of dividing the city for transportation purposes into three divisions. which has subsisted to this time. The lack of unification, which has taken place in most other cities, is the prime cause of the wretched accommodations which the Chicago street-car companies afford the traveling public.

The next chapter of traction history has to do with the now famous ninetynine-year act. In 1865 the companies asked the State Legislature to extend their corporate life from twenty-five to ninety-nine years, and to give a like increase to their grants to occupy the streets of Chicago, without the consent of the City Council thereto. The Legislature did pass this act over the veto of Governor Oglesby and in the face of an outburst of public indignation similar to those which have been manifested in recent years. This action of the companies laid the foundation of the years of rancor and bad feeling that have followed. It was the insistence by the city that all remaining claim of rights under this act should be absolutely surrendered by the companies as one of the considerations for any new grant they might obtain that has proved the main stumbling-block to a settlement. In other words, this unjust and offensive legislation of 1865, undoubtedly passed by corrupt means, has served indirectly as the most powerful single support of the municipal ownership movement of the present. One result of this action was the incorporation in the Constitution of 1870 of a clause making it impossible for the Legislature thereafter to grant street railway franchises without local consent. A law was soon after passed limiting all such consents to twenty years.

The next event of critical importance in the street railway history of Chicago was the entrance into the field of Charles T. Yerkes. Mr. Yerkes had left Philadelphia under a cloud. He set up as a broker in Chicago in the early eighties, without capital, but possessed of great shrewdness and ability. He had the dare-devil courage of the highwayman, and, like the highwayman, he was without conscientious scruples as to the methods to be employed in accomplishing results. He was far-seeing enough to understand the possibilities of street railway development in a city like Chicago, and his Philadelphia experience had taught him the value, to the financier, of the ability to combine politics with business. Moreover, he still had powerful Philadelphia connections that furnished him with funds to float his Chicago projects. In 1886 and 1887 Mr. Yerkes, for himself and his associates, chief of whom were Messrs. Elkins and Widener, of Philadelphia, secured control of a majority of the stock of the companies in the North and West divisions of the city. Then began the most remarkable era of financiering and political manipulation that Chicago has ever known. Companies were multiplied and securities were piled on top of securities in the most confusing manner. Construction companies were utilized to benefit an inside clique. Politically, Mr. Yerkes became the most powerful factor in the community. He dominated conventions and made and unmade councils and mayors, all, of course, under cover as much as possible. Later he had nearly as much to say in naming Governors and in controlling the action of State Legislatures. Mr. Yerkes wanted more valuable grants than it was possible. for the Council to vote him, under the law limiting all such grants to twenty years. He went to the Legislature of 1895 with bills that were passed without much difficulty, but their final success was blocked by the veto of Governor Altgeld. Angered at this defeat of his project, Mr. Yerkes decided to name the next Governor of the State himself and thus be sure of having a man who would carry out his wishes; and in this he succeeded. The Allen Law, authorizing fiftyyear grants, was passed by the Legislature of 1897 and signed by Governor Tanner. By this time, however, so much progress had been made with governmental conditions in Chicago that the city government, under the leadership of Mayor Carter H. Harrison, refused to make any grant whatever until the odious Allen Law should be repealed, and that law was repealed by the succeeding Legislature. From that time on the companies have been continually on the defensive.

The Chicago city government may be said to have reached its lowest level about 1895. The Municipal Voters' League was organized in 1896, and at the outset met with astonishing success in its effort to secure the election of better men to the City Council. In 1897 John Maynard Harlan, a member of the City Council, received approximately 70,-000 votes as an independent candidate for Mayor on the issue of opposition to the Yerkes franchise policy. Carter H. Harrison, who was elected Mayor as the Democratic nominee, immediately took the leadership of the fight against Yerkes. After the repeal of the Allen Law he took the position that there should be no franchise renewals until after the Legislature should pass a law authorizing municipal ownership. It was not the intention of Mayor Harrison that this law should be actually utilized at once. His policy was to grant one more renewal franchise, which franchise should reserve to the city the right of purchase at some time not far distant in the future. He wished the city, when making the grant, to be in full possession of the power to utilize the right of purchase as soon as it should become available. Shortly after the repeal of the Allen Law, the Council committee, headed by Alderman Milton J. Foreman, began working out a constructive policy for the city. A bill giving the city full power to deal with the situation as it might see fit, including the power to municipalize, was prepared and presented to the Legislature of 1901 with the approval of the City Council. This bill failed of passage. When the Legislature met in 1903, however, public sentiment in favor of enabling municipal legislation had crystallized to such an extent that opposition

was futile. The Speaker of the House, who tried to kill the bill under the gavel, was literally driven from the chair by infuriated members, and sought refuge behind barred doors in his private room. He was allowed to resume the chair only on the promise that he would give roll-calls in the future, and the municipal ownership bill, known as the Mueller Bill, thereupon was passed by both Houses and signed by the Governor.

Public feeling against the companies was naturally growing more intense all the time. But the situation was not yet hopeless for them. They could have secured a grant on fairly liberal terms. But they hoped to do better. thought the outbursts of public feeling which they were witnessing were mere passing storms that would clear away and leave them again in control of the situation. In this respect, at least, Mr. Yerkes must be credited with keener insight than his fellow-financiers in the traction world. After the repeal of the Allen Law he had the perception to realize that the game as it had been played was He got his holdings together, and in the summer of 1899 sold out and left for London. The purchasers were chiefly Philadelphia and New York financiers with whom he had previously been associated. These men appeared to think that the trouble in Chicago was chiefly due to Mr. Yerkes's personal unpopu-They thought that with him out of the way the franchise deal could still be engineered all right. Their first move was to organize a new corporation, the Chicago Union Traction Company, start the printing-press and put out new securities to inflate still further a capitalization already watered to the limit. These men had not been in control long before they discovered that they had been duped. One of their attorneys declared in open court that Mr. Yerkes had sold them a gold brick. It was discovered upon investigation that, in order to make a showing, dividends had been paid in the case of some of the smaller companies from borrowed funds. Yerkes had retained in small outlying companies still controlled by him operating rights of great value which it was necessary for the new owners to get control of. Naturally, the

people of Chicago were not greatly impressed by the plea of New York and Philadelphia financiers that they must have franchise renewals on terms that would make good the enormous amount of watered securities held by them. The companies and the Council committee met to negotiate. When the city asked that the companies, in return for a twentyyear renewal grant, relinquish all claims under the ninety-nine-year act, Messrs. Auerbach and Govin, representing the New York owners of Union Traction stock, replied with a lordly air that this could not be done. Thereupon negotiations were broken off. However, the City Railway Company, which was not so excessively over-capitalized, and the stock of which was more largely held in Chicago, after a time reopened negotia-Representatives of this company co-operated with the Council committee in framing an ordinance providing for a twenty-year renewal grant and a complete waiver of all claims under the ninetynine-year act, with a stipulation that after the expiration of thirteen years the city might purchase the property of the company without any allowance whatever for franchise values. This ordinance, while supported by many publicspirited citizens, including Mayor Harrison, was combated from two sources. The Union Traction owners realized that if it should be passed and accepted by the City Railway Company they could never get a better one. The City Railway Company has stock outstanding to the amount of \$18,000,000 par value, without any bonded indebtedness. Its tangible property has been valued by a competent engineer at \$12,000,000. In order to prevent the City Railway Company from accepting the ordinance, a syndicate headed by J. Pierpont Morgan purchased at the rate of \$200 per share a controlling interest in the City Railway. In later negotiations with the city this purchase was cited in support of the claim that the franchises now owned by the City Railway Company are worth \$25,000,000. From the radical side the ordinance was attacked as being too favorable to the company. A referendum vote taken on the ordinance later. when it was no longer a live issue, and

under circumstances peculiarly unfavorable to its adoption, was adverse by a large majority.

At the same election at which this City Railway ordinance was voted down Judge Edward F. Dunne was chosen Mayor on the issue of immediate municipal ownership. Early in his administration Mayor Dunne sent to the Council a message embodying alternative plansone designated the "City Plan," the other the "Contract Plan." The "City Plan "looked toward direct municipalization under the Mueller Law. "Contract Plan" was not an immediate municipal ownership plan at all, but was described as the "short cut" to municipal ownership. While presenting the two plans, Mayor Dunne gave his unqualified approval to the "Contract Plan." The Mayor's critics at once declared that he had abandoned the issue of municipal ownership on which he had just been elected. They said that if he could consistently favor a franchise grant to one set of men there was no reason why others could not with equal consistency favor a grant to the old companies, provided the terms were unobjectionable. So negotiations were again opened between the companies and the Council committee. This, to my mind, was the last opportunity for the companies. believe the matter could have been settled in a way to leave them, for the time being at least, in possession of the field had they been willing to accept a grant running nominally for twenty years, but subject to city purchase on fair terms at any time, or at most at any time after five years. Fair terms in this case would include some allowance for present unexpired franchise rights of the companies. But, as usual, the companies overreached themselves. Mayor Dunne appeared to be floundering. The traction men thought the reaction had set in, and they demanded terms in the ordinance to which the public would not The Council would not pass consent. the measure. Moreover, the Council had pledged itself previously not to pass any ordinance until the people should have had an opportunity to express themselves thereon by referendum, and it seemed useless to submit to a referen-

dum an ordinance criticised by influential elements that had favored the adoption of the ordinance previously proposed for the City Railway. After the failure of the Council to act upon either of the two plans he had previously submitted, Mayor Dunne had presented a third plan, which had been pending for some weeks when the franchise renewal plan fell through. All at once the Mayor's third plan was taken up by the Council and passed hastily, without any detailed consideration of its merits. This ordinance provides for the issuance of \$75,-000,000 worth of Mueller Law certificates for the purpose of acquiring a street railway system by purchase, construction, condemnation, or otherwise. approved by the people, this ordinance will be a blanket grant of authority to the Mayor and Council to proceed to the acquisition of a municipal street railway system. Under the Mueller Law there is a distinction between municipal ownership and municipal operation. Before the city can operate, the question of operation must be submitted to the people as a separate proposition, and approved by three-fifths of those voting thereon. That question is to be submitted at the next election. A majority vote will suffice to carry the proposition for the issuance of certificates for municipal ownership.

That Mayor Dunne's municipal ownership ordinance will be adopted at the election of April 3 I have no doubt. Moreover, all things considered, I believe it should be adopted. I have very serious doubts, however, if municipal ownership will be attained under this particular ordinance. An affirmative popular vote on it is necessary to register the onward march of public opinion. negative vote would be taken to indicate a reaction in sentiment on the part of the electorate and would lead to the resumption of negotiations between the city and the companies, with a certainty of failure again on that line. An affirmative vote will be taken to mean that the people are through with the old companies and that they might as well make up their minds to sell out and quit before they shall be forced out at further loss to themselves. If adopted, however, the

ordinance itself will not bring early results. The way out, in my opinion, would still lie along another line—that is, through the adoption of a modified form of Mayor Dunne's so-called "Contract Plan." That plan will not only soonest bring order out of the present chaos, but it offers the surest and quickest road to municipal ownership.

I am of those who believe in the policy of municipal ownership and operation of the street-car lines of Chicago just as soon as that can be brought about on proper terms. My quarrel with those in Mayor Dunne's administration and elsewhere who look upon themselves as the only simon-pure advocates of municipal ownership is that they want the thing in advance of the time when it can possibly be brought about. The city of Chicago is, at present, powerless to issue additional bonds for any purpose, and hence can issue none for the construction or acquisition of street railways. The only way left to finance an immediate municipal ownership project is through the issuance of the certificates provided for by the Mueller Law, which certificates are to be a lien only on the street railways themselves and not a debt of the city, properly speaking. Now this certificate feature of the Mueller Law is admittedly experimental and of uncertain validity. The certificates will not sell on the market until the Supreme Court has pronounced them valid, and not then unless investors shall be satisfied of the feasibility and practical wisdom of the plan proposed. will be at least eighteen months or two years of litigation over the various features of this ordinance, if adopted, before a thing can be actually done under it. Before the litigation is ended and a start can be made toward working out the plan Mayor Dunne's present term of office will have expired. While this ordinance gives the Mayor and Council power to go ahead, it does not require them to do so. The power is not liable to the abuse that would lie in a like grant of authority to issue regular city bonds, for the reason that the investors, having, in case of failure and foreclosure, no recourse except to the property itself, and the right to operate it for twenty years

under a mortgage franchise, would be bound to satisfy themselves, before advancing the money, that it is not likely to be wasted. Before the time comes for action along the lines of this plan I am satisfied that numerous changes will be found necessary. In the meantime the need of speedier results than this method can afford will be evident to all. These results. I believe, can be best obtained through a modified form of Mayor Dunne's so-called "Contract Plan." The term "Trustee Plan" would have been a happier characterization. The essential idea of this plan, it may be worth noting in passing, was commended by Mayor Dunne's predecessor in office, Mayor Harrison, in his last message to the City Council.

Under this plan a franchise to construct or acquire a complete street railway system for the entire city would be granted to a group of public-spirited citizens, who should manage the property in the interest of the public and use all earnings in excess of a fixed return on the investment to retire the investment.

When the plant should be paid for out of profits, the property would belong to the city, or it could be taken by the city at any earlier time when the city can find the money, either through the sale of Mueller Law certificates or otherwise, to reimburse the investors. The franchises of the existing companies began to expire July 30, 1903, a large mileage having already expired. There are other grants which clearly have several years to run, some as much as ten years. third class comprises the lines which the companies claim under the ninety-nineyear act, and which are in litigation. Just so soon as the city shall show practical capacity to develop a rival system it is probable that the old companies will sell out at a reasonable figure. If they will not, the expired mileage will furnish the nucleus for a comprehensive system that will supersede the old in a comparatively short time.

The one thing evident in the Chicago situation is that the people demand and are going to have a new deal on the traction question.

THE CHILDREN'S PLEA

BY JACOB A. RIIS

EADERS of The Outlook have not forgotten Sea Breeze with its hospital for crippled children, and the plea of Miss Laura Winnington when she lay dying in St. Luke's Hospital for a bigger institution that should repeat on a many times larger scale the success achieved there with that terrible scourge of ill-nourished childhood, bone tuberculosis. And they will recall the results that followed quickly: the visit of the President and Mrs. Roosevelt to Coney Island, and the raising of a large sum of money overnight, as it seemed, to realize Miss Winnington's dream. She closed her eyes upon this world with the knowledge that her wish was granted. Of the four or five thousand little cripples in New York's tenements with this ailment—hopeless unless the chance is given them of a life in the open on the seashore, summer and winter, until the healing forces of nature

have done their work—only one in a hundred could find shelter at Sea Breeze. The new hospital was planned for at least ten times that number. The plans called for a building to cost a quarter of a million of dollars. John D. Rockefeller offered half that sum if the other half were raised before spring came again. The thing was to find a site.

It proved not so easy to get as had been supposed. On Coney Island there was no room. For a while it seemed as if there were none anywhere; as if the wave of pity for the forlorn little sufferers had swept on and out of sight, leaving cold selfishness and the greed of "property interests" in its place. Everywhere the door was slammed in the faces of the children's friends. No one wanted the cripples for neighbors. The seashore is for pleasuring, we heard; they would contaminate, ruin it. They did not know. Could they have seen them and

what it all meant, they would never have let them pass. Verily, I think they would have given them the land for the asking. I know right well they would.

But they did not know. It became necessary to take land by condemnation, and it was resolved to kill two birds with one stone by hitching the plan to two prime needs of the city, viz., a great seashore playground for the people and a convalescent home for the sick and disabled poor who are daily crowded out of New York's hospitals by the tremendous pressure upon them, although wholly unfit to take up the battle of life again. A bill was prepared, with the consent and support of Mayor McClellan, empowering the city to take property on the seashore where it would. It is now at Albany awaiting action. Since then a public-spirited citizen, Mr. Edward P. Hatch, has offered two miles of shore front on Rockaway Beach at, it is said, half its value for this purpose, and it seems certain now that the plan of this great benefaction will be realized without too long delay. There has been too much The metropolis, with its unequaled location, has been singularly backward in grasping the opportunity to provide a seashore park for its people. A little while longer and it might easily have been too late. The overcrowding of our hospitals has long cried aloud for a convalescents' home as an act of plain humanity. These things speak for them-I had sat down to speak for the little ones here, when they came to plead their own cause, all unconscious of their mission.

The children at Sea Breeze had heard that I, too, had been laid away in a hospital for a while to tame a rebellious heart if I might, and nothing would do but they must write to tell me how sorry they were. So to-day the mail brought me a batch of their letters. that carrier knew how much of sunshine and cheer his bag held. Here is fiveyear-old Max Gross, child of poverty and want, all the days of a long and weary year strapped to a frame that holds his little body rigid because his back is not like other children's, yet ever cheerful, ever hopeful, calling across the room to the doctor, "I am all better!" Poor little chap! Once, and only once, his tears fell; and when his nurse went to him in alarm, he sobbed out upon her sleeve that some one had said on the porch as he was carried by: "Max will not get better." "And I don't want to get dead and be an angel," was the cry that wrung the nurse's heart; "I want to get off my board and play first." Hear his message to me:

Dear Mr. Riis

I am very sorry you are sick. Are you on a board like me? I got a yellow pencil. I am writing this letter with the pencil. I am writing all myself, only someone is holding the pencil, too. Are you up?

A big dog bit Rags' eye. I think Rags belongs to Madge. Mary Maguire is dressed up like Miss Roosevelt. She has on a long veil. It is made of tissue paper. Maggie Brennan is dressed up, too. She is the bridesmaid. Come down again and bring Mr. Roosevelt. I would like to see you again. Good-bye, with love from your friend, MAX GROSS.

Max came from a slum tenement. His parents are poor Jews. some one who held the pencil with him tells me that he hesitated over "Miss" Roosevelt. He had meant to say Alice. but did not think it was proper, and decided that it was not. The visit of the President to Sea Breeze is the proud tradition of the children that helps them over many a hard hour. They rehearse it again and again, usually with Max as spokesman. He forgets then the pain in his back, forgets the play that is not for him-never in this life-and remembers only the kind face that hovered over him and looked out of brimming eyes at his wasted frame. Then all Max's native optimism comes to his rescue with a rush, and he winds up his story: "I think the President will come back: for Dr. Wallace told him my name and he said, 'Max, I hope you will get better.' He had nice shining eye-glasses and a big laugh."

Max has one priceless possession—an umbrella Santa Claus brought him by special request "lest it should quick come on to rain when he was going across the porch with Louis;" and regularly every day, rain or shine, he goes down stairs in Louis's arms, hugging the precious thing to his board. The big children may believe that Santa Claus

"came out of the cellar at Sea Breeze" when they had the Christmas-tree. Max knows better. He has the evidence always in sight.

Madeline Garland is Max's bosom friend. She is seven and her Sea Breeze name is Bumps, supposedly from the big freckles that cover her jolly little face and snub nose. Like Max, she lies all her days strapped to the board that looks so cruel and is so kind, and views the world about her "brimming over with joy," her nurse says. Sea Breeze is all the home she has ever known. Her mother is a widow and lives out. Here is her letter:

Dear Mr. Riis

Annie and Pasco and I and all the children are sorry you are sick. Do you have a bed outdoors like me? Is there a fire alarm in your hospital? We have fire drill here. Henrietta carried me out when the bell rang. Have you got some one like Henrietta to carry you out?

I am writing this letter myself, just like Max. Dear Mr. Riis, I hope you get better. Give my love to President Roosevelt. With

love from your friend

MADELINE GARLAND.

And David Goldscher, the boy with the pale pathetic face that haunts me ever since I saw him standing propped up by his crutch, singing grace with the children at supper, the dreamy boy from the dark tenement in dark Allen Street where the elevated runs overhead, writes: "Now it is getting spring. I've seen lots of birds flying, and the ocean looks very still. Don't you think the sea would do you good, with the fresh air? Well, I hope you can come to see us soon and be all better."

Children of the poor! Yes, of the poorest. But shall we let such as these perish unhelped? Here in the hospital where I write are twenty such in the surgical ward, for whom only the seashore hospital holds out the promise of life. Every hospital has the same story

to tell; every children's institution is filled with them. Thousands slowly tortured to death in the tenements! Think of it, you fathers and mothers with healthy. happy children; think of the little soberfaced patient at Sea Breeze that said of her friend who was seven and never would walk: "She used to play when she was young." Think of Pasco, aged thirteen, in the grave conference on the beach over the things they would do and be when they grew big: "I want to be a boy first." The Association for Improving the Condition of the Poor says it needs seventy thousand dollars yet for the building of the hospital. If I know my city right, it will not need to ask another day.

Sometimes it is to me as though in the brave patience of these stricken ones I caught a glimpse of the real things of life and their meaning to us who, with sound bodies, are strong and able to do the world's work. Only last week there came a letter from a crippled girl way out West whose mother I know, a hardworking widow, growing old with this sorrow at her heart that her only child can never be strong and well. "I used to lie awake the long nights after the doctor had told me," writes the girl, "grieving because I could never do anything. But that was years ago. I am earning my living now teaching school, and the crutch doesn't hinder me much. I shall be able to care for mother when she is tired. I even think I shall be able to save enough to take her back once more to the old home across the sea that she so longs for. And the thought makes me happy." Never do anything! What is there in all the world that money can buy that compares with the pleasure of doing for these, who do so much for us, all that human skill, that long-withheld chance, can do to ease their pain?

A GROUP OF NOVELS'

LITTLE group of novels recently published disclose unusual seriousness of mood and thoroughness of workmanship. questions of the day touch matters so vital to life and art that there has come into the best fiction a note of pathos which escapes the paralysis of skepticism by courage if not breadth of vision. There is no form of writing so futile as the literature of futility; the unraveling of all the threads, the fading of all the qualities of character into a shabby gray, the growing indistinctness of a path which loses itself at the end in a waste of nothingness. Tragedy can be borne, for there is always a touch of greatness in it; but the interpretation of life as a meaningless grouping of things and persons in relations which cut no deep lines in character, and are themselves the accidents of an accident, is intolerable to a sane mind. Fate is a cruel God. but still a God, and under its iron hand, as in Thomas Hardy's stories, man has some touch of dignity and his destiny some grace of meaning; but a world which has no ruling energy or intelligence, and is a fortuitous collection of atoms, is a world which makes no room for thought. A man suffocates in the nightmare, not of a world which passes his comprehension, but of a world in which nothing counts either for tragedy or comedy.

In such a story as Miss Ellen Glasgow's "The Wheel of Life" there is no lack of tragedy of a pitiful kind, but the

tragedy involves growth rather than waste, and out of the chaos of weak wills, self-indulgence, poverty of interests, and empty frivolity something definite and significant in character emerges. people in this very seriously conceived drama of spiritual growth belong to the so-called "fast set," so mercilessly studied in "The House of Mirth." Miss Glasgow, like Mrs. Wharton, has made New York the background of her novel, but every large city and many small cities furnish the same conditions on a smaller scale and produce the same types of character. A vein of Orientalism, suggested by the title, runs through this novel, which deals, in its largest aspects, with the early illusions, the pain of education, and that enlightenment which involves, not rejection of the order of life, but acceptance of a spiritual scale of values and the subordination of the lesser to the greater. Through the four stages of impulse, illusion, disenchantment, and reconciliation the two chief actors move to a tempered happiness which is the fulfillment of a moral process and the justification of its inexorable and penetrating discipline. This interior movement does not obscure the exterior dramatic action of the novel, though it is occasionally over-emphasized by too much definition. There are broader contrasts of character than in "The House of Mirth." though not quite the same sureness of touch, the same sense of intimacy with the most elusive aspects of a well-defined though loosely ordered social group. Frivolity and vice are relieved by the play of light from the finer virtues across the picture, and the studies of character are done with the most delicate fidelity. style shows a marked change, and approaches more closely the analytic and subtle selective process of those sophisticated writers who reflect a dominant, though, it may be suspected, not the deepest, mood of the period. It is to be hoped that Miss Glasgow will not go further in this direction.

Mr. Phillpotts has never sketched the

loveliness and majesty of the Dartmoor country with a surer hand than in "The Portreeve," a story of elemental passion; one of those tragedies which flow from the focusing of the will, unrestrained by moral feeling or instinct, on a single object, and the ruthless direction of the intelligence and energy of a powerful nature to an end never obscured by intellectual hesitation or moral doubt. The office of portreeve has an ancient origin, and, although its authority has departed, is still an object of local ambition. The man who is chosen to fill it in this instance is frugal, sincere, tireless, and loyal to his principles; lacking in imagination, but well equipped for an effective and honorable career. He has the misfortune to awaken the passion of a proud, self-centered, and self-willed woman, who adroitly breaks off a love affair with another by an audacious and daring expedient; and when, in the end, the Portreeve marries her rival, by a persistent and merciless use of the advantages of her superior position and wealth, blocks his progress, thwarts all his plans, and drives him to desperation and finally to death. The motive is one of the most repellent within reach of the novelist, and is worked out with unsparing boldness. The strain of the story is relieved only by its outlook on a landscape of noble hills and valleys transfigured by mists, and great reaches of mountain-side against which the mists move in sublime detachment.

No recent book is more difficult to describe and classify than Mr. George Moore's novel, "The Lake." It is a study of two contrasted temperaments rather than a novel: but it has a defined movement, and it culminates in a climax which falls short of a solution. A young Irish priest becomes interested in the teacher of the parish school, who has a lover, and when her condition becomes known preaches a sermon on her sin so pointed that she flees from the parish. Her disappearance lies heavy on his conscience, and he persuades himself that by driving her away he has probably become responsible for her ruin. She presently reappears in London, becomes secretary for a scholar who is absorbed in the critical study of the Old

Testament, goes with him to the Continent, and eventually to Palestine. story of the influence of the girl on the priest and the contrast between their characters is told in a series of letters. which gradually make the priest aware that what he regarded as spiritual interest in her welfare is a very human form of The unveiling of his state of mind is made with great skill and delicacy; the loneliness and narrow interests of the little Irish parish and the easy, vital relations of the girl with art, affairs, and life are set in a strong light; and the underlying motive is the contrast between the rigid conception of life of an undeveloped priest and the unhesitating and joyous acceptance of the life of intellectual curiosity by a woman who follows instinct with a free heart. The text is largely descriptive of landscape, interesting localities, and pictures, with easy play of criticism on the priest's way of thought and life. The lake which gives the book its title has as great a part in the unfolding of the story as the moors in Mr. Hardy's stories, and its changes, moods, and reflections are reported with delicate and searching skill. Mr. Moore's work is notable for skill of analysis and for charm of style, but it is as free from moral feeling as if there were no guides in the world save instinct and impulse; herein lies the limitation which keeps it out of the class of lasting fiction.

What is "The Shadow of Life"? Love or Death? In this beautiful and relentless picture (if such glowing and vital writing as this can be designated by so passive a name) Miss Sedgwick compels us to stand beside her as she uncovers the mental and moral processes of two noble It is rare to find childhood as exquisitely described and as perfectly understood as the childhood of Eppie and Gavan. The air of the moors, the lowering or the sunny sky, the boy and girl, with Robber the little dog, are more than a mere picture—they live. A lonely, sad boy, Gavan came to Scotland, leaving his idolized mother alone with her brutal husband in the arid glare of Indian army circles. Already the shadow of pain and shame stretched itself across the boy's horizon. Eppie, ten years old, and four years younger than Gavan, was

"a dear little girl," whose atmosphere was sparkling with vigorous though entirely childlike helpfulness and keen sympathy. When Eppie was angry or grieved, she howled; when Gavan was grieved, he shrank within himself. the story opens -- in unusual beauty. For many years the two friends did not meet—and only when Gavan was thirty did he revisit the old house on the moor. From that moment the conflict between the two natures raged. Gavan had become a mystic, Eppie clung boldly to life and love. In this period the author displays her remarkable powers of analysis and her capacity for dispassionate observation. Any thoughtful reader will linger, absorbed by the struggle between these friends, developing into a strange, overpowering, reluctant, renouncing love. Eppie never flinches from her purpose to overcome death in Gavan—the lifeless, selfless death of the dreamer, who has abdicated personality, and to whom all earthly things are delusions and all apparent life only the insignificant movement of the particles in a kaleidoscope shaken by an unknown power. She shatters herşelf upon him, and even in dying glows with the radiant life that has been her faith. She is the one flaw in Gavan's accepted theory; she brings him back from his acquired peace and makes him understand suffering and love. story is a tragedy of souls. In the end, though in reality Eppie had nothing, "her triumph was shadowless," and for him "a hand stretched out from the past would seize him, a shudder, a pang, would shake him, and he would know that he was alone and that he remem-Eppie and Gavan so dominate the scene that other admirably drawn characters, the sweet family life on the moor, the strong, worldly, and yet unselfish lover, Jim Grainger, and the cleverly indicated settlement workers in London, with one or two minor persons, are undeservedly in the background. In the end Life is stronger than the Shadow, and though in apparent defeat, it triumphs.

In "The Jungle" Mr. Upton Sinclair is trying to do two things—to expose and denounce as intolerable the conditions of life and work in Chicago's "Packingtown," and, secondly, to prove

by argument that National Socialism is the only cure for such evils. Artistically speaking, the joint between these two parts of his book is too obvious; he begins in the fiercest light of melodrama and ends like a lyceum lecturer. Moreover. this difference between the "exposé" and the argument precisely illustrates the author's temperamental defect—he is strong at destruction, weak at construction; at his best in invective and denunciation, ineffective in persuading and inspiring. There is doubtless room for improvement in the packing-houses, in the treatment of labor—the writer of an article in The Outlook at the time of the stock-yards strike quoted one of the largest employers as saying, bluntly, that when, in fixing wages, he was asked to consider the employees' conditions of living or his own profits, there was nothing to do but fight. There is also a general belief that the sanitary and manufacturing aspects of the stock-yards should be improved, in the interest of the consumer as well as of the workman. If this book helps to secure more rigid inspection and more drastic regulation, it will deserve praise. But to select a single family of Lithuanian workers, to pile upon their devoted heads every hardship and injustice imaginable, to disgust the reader by dragging him through every conceivable horror, physical and moral, to depict with lurid excitement and with offensive minuteness the life in jail and brothel—all this is to overreach the object. One remembers that it is very easy, in fiction, to mingle the true with the imaginative; that even things actually terrible may become distorted when a writer screams them out in a sensational way and in a high-pitched key. In short, Mr. Sinclair's indictment of the employing classes would have been more convincing if it were less hysterical.

Miss Edith Rickert, whose first novel, "The Reaper," will be remembered for its delicacy of feeling and charm of style, now presents in her second book, "Folly," a story of an altogether different type. If it be held that any account in fiction of a passionate love felt for a man other than her husband by a married woman is inadmissible in the English novel, then

this story must be passed unread. But the problem underlying the story is not so much one of passion as of character. The psychology of "Folly's" development from a rather frivolous and whimsical creature to a woman of force and courage is both subtle and singular. The key is found in the fact that what had been a shallow and careless flirtation becomes deepseated and uncontrollable devotion only when "Folly" learns that the man in question is dying slowly of an incurable disease. She deserts home, child, and husband, but finds that she may not be either the dying man's nurse or mistress. He solves the problem by slipping away to die in a distant country, and in the end "Folly," through a life of devotion to other helpless ones, recovers her poise and begins a sane life. All this is of course rather depressing in substance, but the difficult theme is worked out with reserve and discrimination.

Maarten Maartens's "The Healers" is a puzzling book if one seeks to find its philosophic purpose, but looked at as a picture gallery of carefully etched character portraits it is immensely entertaining. As compared with the author's earlier books, such as "God's Fool," it is less impressive and certainly less clear in its suggestion of the beautiful and noble in human effort, but, on the other hand, it is constantly witty and sometimes epigrammatic. This seems all the more notable when it is known that idiocy and insanity, their nature and distinction, underlie the story and that the "healers" are types of the microbetheory scientist, the hypnotic-influence expert, the psychopathic doctor, and the ordinary alienist. While this sounds formidable, the story is in point of fact agreeable and even fascinating reading. The men and women described are alive and are interesting in an unusual degree.

Among the entertaining stories of the season a first place must be given to Mr. Jesse Lynch Williams's "The Day-Dreamer," an expansion of a shorter story which was widely read and enjoyed. There is a general stir in this novel which successfully simulates the rush of a daily newspaper office when the presses are in motion and the "stories" are coming in from every quarter. reporter's slang, which is a kind of dialect known only to the initiated, is freely used, and the narrative bristles with expert knowledge of reportorial ways and speech. "The Truth about Tolna" also has a good deal of journalistic quality, and deals with a novel situation with much gavety and easy-going handling of persons and situations. The dialogue is more successful than the construction, and, as a very light comedy which often passes over into farce, Miss Runkle's long-expected second novel has some interest; it can hardly be counted a successful piece of fiction. Of Mr. Hopkins's uncompromising romance, "The Clammer," much might be said in praise of its quiet, rather old-fashioned style-leisurely, meditative, and wellbred. There is no plot; only an uneventful love story, with a man of solitary habits, who digs clams because it amuses him, and makes a garden, and keeps clear of his neighbors, a charmingly drawn girl, a rich father who is not spoiled, and a proud mother who is humanized by the birth of a grandchild. There is a good deal of landscape and sky and sea in the narrative, which depends for its charm largely on atmosphere and sentiment. Mr. Sienkiewicz's "On the Field of Glory," already spoken of in The Outlook, has much of the fire, action, humor, and stirring historical interest found in his famous Polish trilogy of romances.

THE MENACE OF PRIVILEGE

THAT is the cause of the grave changes that are coming over the American Republic?—the extraordinary inequality in wealth distribution, class feeling, the aristocratic idea, lowered morals among the rich, moral deterioration among the working masses, militant trade unionism, perversion of courts, illegitimate use of militia, corruption of politics, limitation of freedom of press, university, and pulpit, centralization of government, foreign aggression. The answer is, the appearance of Privilege. This volume strives to show how special privilege underlies these ominous appearances. The remedies proposed are, "Tax land monopoly to death" and "Take all public highway functions into public hands."

The foregoing paragraph condensed from the Preface must here suffice to indicate the nature of this book. style is excellent, the spirit earnest, the vision clear though not unprejudiced. The son is more than the pupil of his father, he is his father's heir. In clearness and cogency of presentation this volume is scarcely inferior to "Progress and Poverty." There is much in this volume that is true, much that needs to be said, much that is well said. The difficulty with the book is that its view is both a partial view and a short view. It is partial because the author does not recognize the advantages, both moral and economic, which have come in with the era of industrial combination. It is a short view because the author does not recognize the important fact that we confront not the origin but the recrudescence of Privilege.

During the eighteenth century Privilege reigned supreme in Europe. It was open, unconcealed, avowed. The results of it in France Taine has described in "The Ancient Régime;" the results in England Lecky has described in his "History of the Eighteenth Century." Against this reign of Privilege the French

Revolution was a revolt on the Continent. the American Revolution was a revolt for Great Britain as well as for her colony. The era of Privilege was followed by the era of individual liberty. Jeremy Bentham was its prophet. His doctrine involved three propositions: (1) That the true end of government is the greatest good of the greatest number: (2) that each individual is the best judge of his own interests; (3) that if we leave each individual free and untrammeled in industry, and with an equal share in government, the interests of all will be well cared for. It is always true that the just end of government is the greatest good of the greatest number; it is sometimes true that the individual is the best judge of his own interests; it is never true that the interests of all will be well taken care of by a system which incites all individuals to struggle each for his own interests. Privilege. which was driven out to the tune of the Rogues' March at the close of the eighteenth century, has been creeping in since, without banner or music, under individualism, until it sometimes seems as though it were as firmly ensconced in its old chair as it ever was.

Individuals in their struggle for selfinterest instinctively combined. They protected their interests, whether they were capitalists or laborers. And as all is "fair in war," the morals of trade necessarily suffered when industry became a war between organized labor and organized capital over the products of their combined industry. The notion that every individual should vote for his own interests, that so the interests of all may be secured, has brought back a corruption into government almost as sordid as that which had been scourged out of government. Law in a commercial age is naturally first of all a bulwark of property, and the courts, instinctively defenders of property, have leaned toward the side of Privilege because it was the pre-The press has rogative of property. become a great property, and so the defender of property privileges.

¹ The Menace of Privilege. A Study of Dangers to the Republic from the Existence of a Favored Class By Henry George, Jr. The Macmillan Company, New York 760

university, more concerned with the history of the past than with plans for the future, has been by its very nature conservative; and conservatism in a commercial age means protection of Privi-The Church, for reasons not quite easy to understand, has become the institution of the commercial classes, and "like people like priest" has made the Church sometimes the advocate of the commercial classes and generally timid in rebuke of its iniquities. Even in Hebrew history we recall only one Nathan who said to the king to his face, "Thou art the man." Never was a falser notion than the notion that a free conflict of self-interests would secure purity in government or peace or prosperity in industry.

And yet Privilege holds no such vantage-ground in this beginning of the twentieth century as it held in the close of the eighteenth. Then it was backed by the Church; now the worst that can be said of the Church is that it is too often either silent or unintelligent. Then the only public opinion which was recognized and the only conscience which was educated supported Privilege; now both public opinion and the public conscience are either clamorous against it or doubtful about it. Once Privilege possessed all the powers of government, the people none; now the people possess all the

powers of government, and need only to know how to use them. Once neither pulpit, press, nor platform was free. Mr. George's "Menace of Privilege" published in the eighteenth century would have landed him in the Bastille; in England it would have landed him in Fleet Street or in the Tower of London. Meanwhile a century of education has taught us that we cannot protect our individual interests except by combinations, capitalistic, industrial, and political, which recognize that an injury to one is an injury to all and a benefit to one is a benefit to all.

As to remedies, we agree with Mr. George's first and we disagree with his second. Natural land values belong to the people, and they can and ought to be secured, at least measurably, to the people, by the simple method of what Mr. Shearman has well called "Natural Taxation." As to public highways, we would make the attempt to resume the value of the franchises so recklessly given away, by putting a legitimate taxation upon the possessors and operators of the railroads, and to secure the public administration for the public benefit by Governmental regulation enforced by public opinion. If this should fail, it will then be time enough to consider the experiment of Government ownership and administration.

Comment on Current Books

In his introduction to this Amaryllis at edition of what we believe the Fair was the sole novel written by Richard Jefferies, the English student and lover of nature, Mr. Edward Garnett declares that, although it is true that this is not a novel in the ordinary sense, and that critics have with touching unanimity said that Jefferies should have stuck to essays in natural history, it is nevertheless also true that " here will be found, united and mingled, the song of the wind and the roar of London, by those who do not bring the exacting eye of superiority to this most human book." So considered, the book may be found worthy of careful reading, although nothing could be more wooden and unnatural than the talk of some of the characters. (Amaryllis at the

Fair. By Richard Jefferies. E. P. Dutton & Co., New York. \$1.50.)

Brown of Moukden

Mr. Herbert Strang, evidently from an intimate acquaintance with the country and people, has written a capital story for boys, in which several characters entangled in the late Russo-Japanese war figure. Brown of Moukden, an English merchant, suddenly disappeared under Russian auspices. His son, a bright lad, determined to save what he could of his father's property from Russian confiscation, and also to find where his father had been "deported." In the search a plot is uncovered which involves a pretty Polish girl, the daughter of a noble With all this material the clear head and clever

pen of the author make an admirable piece of work. (Brown of Moukden. By Herbert Strang. G. P. Putnam's Sons, New York. \$1.50.)

Warren Cheney, author of The Challenge "The Way of the North," knows his Alaska and the Russians there thoroughly. There is in this story a restrained dramatic intensity very grateful to the artistic sense. The fatal tide of the "draw" in the harbor of Lityua Bay is no more remorseless than the passion for revenge in the bereaved heart of the Russian priest. The beauty of the flower-covered hills in the hot summer is no purer or more true to nature than the simple yet perfect love between Ivan and Motrya. The mingling of abject superstition and hard common sense touched with humor in the Russian people offers the most inviting material to a skillful novelist. (The Challenge. By Warren Cheney. The Bobbs-Merrill Co., Indianapolis, Ind.)

We have received an interest-Easter Cards ing and artistic series of illuminated Easter cards bearing such titles as "Sorrow's Queen" and "Pasque-Flowers." The designs are in part adapted from old missal illustrations, and the designer, Mrs. Hugh L. Burleson, of Fargo, North Dakota, has evidently taken pains to make the designs appropriate to the season and to the individual text matter. Bishop Mann and Dean Burleson are the authors of the legends and poems on the cards. The price of these cards is thirty-five cents each, and they may be obtained from Messrs. E. P. Dutton & Co., Dodd, Mead & Co., or Edwin Gorham, of New York City.

Dr. Alexander Maclaren is Expositions of widely known in the British Holy Scripture and American churches as a gifted expository preacher. The present volume, containing some fifty discourses on subjects taken from the book of Genesis. begins a series intended to cover the entire Bible, in which the fruits of his lifelong study in the expository line are to appear. However one may dissent from Dr. Maclaren's occasionally non-critical valuation of his text, and notwithstanding his sometimes reading a lesson into instead of out of the text, he is an adept in unfolding the universal spiritual lessons which wait for the discerning eye throughout his field. (Expositions of Holy Scripture: Book of Genesis. Alexander Maclaren, D.D. A. C. Armstrong & Son, New York. \$1.25.)

The Genius The shadow of sad Russia stretches itself across this story, and the author, Margaret Potter, proves

herself quite capable of producing a finely conceived and well-executed picture of conditions in that land. The development, through much hardship, sorrow, and dark knowledge of the evil world, of the genius of a great musician, is traced from a boyhood sheltered by intense mother love, through youth and manhood open to the blasts of hatred and injustice, to a sad and hopeless end. The soul of the artist met disappointment, though the man achieved artistic suc-There is an irresistible fascination about the great gray land which captivates the imagination and proves an endless treasure to both writer and reader alike. (The Genius. By Margaret Potter. Harper & Brothers, New York. \$1.50.)

Grace Church in New York, at A Good the point where Broadway, till Shepherd then oblique to the meridian, turns into it and runs straight toward the pole star, may seem by its situation happily suggestive of the aim of these sermons by Dr. W. R. Huntington from its pulpit. The title of one of them, "Facing Inevitable Change," gives expression to the thought that seems to brood over others of themrecognition of change coupled with intentness on certainties unchangeable. Timely as they all are, some are especially so, as that on "The Afro-Americans," from the text, "Lo, the people shall dwell alone." The discourse from which the volume takes its title commemorates the late Frederic D. Huntington, the first Bishop of Central New York. (A Good Shepherd and Other Sermons. By William Reed Huntington, D.D. Thomas Whitaker, New York. \$1.25, net.)

This is one of the best among The Hill the many stories of English school life. Harrow-on-the-Hill is the scene where a lifelong friendship between two of the boys began. There was nothing conventional or easy in the attraction they felt for each other. One, the popular, handsome, wellborn son of a man high in state councils; the other, adoring the first with a boy's full sentiment, was a steady, rather plodding son of a widow, but nephew to a noted explorer, whose deeds were recorded high in Harrow's hall of fame. Socially the two boys were equal. In their individualities was the contrast that made, in the end, for friendship. One cannot doubt that the author, Horace A. Vachell, presents an accurate view of school life and influences. The robust, manly training given to English boys, when certain elements of brutality are eliminated, fits them to take their honored places all over the world as the molders of governmental policy, the uncompromising opponents of venality. Just

this sort of training did these Harrovians get, and some of them responded to it and were worthy. An admirable book for boys. (The Hill. By Horace A. Vachell. Dodd, Mead & Co., New York. \$1.50.)

Mr. Roberts is one of the ablest The Idlers of the latter-day group of English fiction writers, so far as regards clearness, directness, and tenseness of situation. But the present story seems to us deplorable, if not reprehensible, because it is cynical and too realistic in its presentation of viciousness and decadence in fashionable London society. It is true that the wrong-doers, and especially one woman whose character and conduct are utterly abominable, meet with disgrace and suffering in the end, so that the novel may be said in a way to carry a moral; but this does not seem to us to free the book from the charge that its influence would be bad rather than good. (The Idlers. By Morley Roberts. L. C. Page & Co., Boston. \$1.50.)

A romance set in an Ohio town a Judith half-century ago, during the lull between the Mexican War and the Civil War. The author, Grace Alexander, conveys to the reader the sense of the bygone customs and modes of thought, and she is ably seconded by the illustrations. It is a wholesome story of true love sacrificed to a high sense of honor and devotion to painful duty. While there is nothing startling in the plot, it is refreshing to read of men and women obedient to moral and religious principles, even though the novel-reader may smile and call them stiff and slow. (Judith. By Grace Alexander. The Bobbs-Merrill Company, Indianapolis, Ind.)

The Liberty of the Press

The very first amendment adopted for the Constitution of the United States was that which forbids Congress making any abridging the freedom of speech or of

law abridging the freedom of speech or of the press. What existed in this country before that time in regard to the freedom of the press is told in a most interesting and curious way in this monograph. The several chapters take up the question as it existed in Massachusetts, Pennsylvania, and the Southern colonies, while the conclusions reached in the final chapter show that at the close of the period under discussion there was really no liberty of the press as we now understand the term. How rigid the old practice was in Massachusetts may be seen by quoting the utterance of Governor Blackwell to the famous William Bradford. The latter having intimated that he had never heard any rule against his printing such things as he might desire, the Governor replied: "Sir, I am Imprimatur, and that you shall know. I will

bind you in a bond of £500, that you shall print nothing but what I allow of; or I shall lay you fast." (The Liberty of the Press in the American Colonies Before the Revolutionary War. By Livingston Rowe Schuyler, B.D., Ph.D. Thomas Whittaker, New York. \$1, net.)

A stirring tale of love Marcelle the Mad and adventure in the time of Charles the Bold and his father, the Duke of Burgundy. The author, Seth Cook Comstock, is able to sustain the appropriate historical tone and yet infuse much vigor into the scenes. Despotism, outlawry, injustice, cruelty, and loyal love and devotion go to the making of the romance. The closing scene is the sad procession of exiles leaving Liège at the harsh command of Charles. In this procession walk the hero, Sieur d'Orson, a former follower of Charles, and Marcelle the Mad, leader of the outlaws-absorbed in their mutual love. (Marcelle the Mad. By Seth Cook Comstock. D. Appleton & Co., New York. \$1.50.)

This "statistical study Heredity in Royalty in history and psychol-Adams Wood, of the Massachusetts Institute of Technology, is a work of the first class in its department of research. Galton and others have maintained the predominating influence of heredity on character, but Dr. Woods has demonstrated it by a more rigorous scientific method; indeed, by several distinct methods, including the mathematical. He takes up what Galton avoided. the study of modern royal families, whose pedigrees, being traceable much farther than those of any other class, promise to yield the most conclusive settlement of the conflicting claims of heredity and environment to be the determining factor. The body of his work is a study of eight hundred and thirty-two characters belonging to the royal houses of eleven European countries. These individuals, men and women, distributed into ten grades of mental and moral worth, separately based on historical estimates, make out an indisputable case for the superior potency of heredity. At the same time they correct some popular impressions, especially as to the supposed evil effect of the intermarriage of persons near akin. The royal breed, taken as a whole, leads all others in Europe. "Where else could we take eight hundred interrelated names at random and find twentyfive world geniuses?" If genius for science and art is maintained through fewer generations than genius for government and war, it is because there is more intermarriage of the great governing families. The best in-

Digitized by Google

heritable influence in Europe appears in the present royal family of Great Britain. Over a hundred portraits are introduced, in which there appears physical inheritance accompanying the mental. It appears also that there is a clear correlation of mental and moral qualities. Moral improvement tends to mental. The morally superior survive, and the inheritance of moral and mental excellence yields the optimistic augury of "the necessary progress of mankind." (Mental and Moral Heredity in Royalty. By Frederick Adams Woods, M.D. Henry Holt & Co., New York. \$3, net.)

The fact that seven vol-Novels of umes of novels and stories Edith Wharton by Mrs. Wharton have now been brought forth in a uniform and pleasing edition is simply another testimony of the fact that her work in fiction has been recognized by the general reading public as it deserves to be. One can hardly fail to notice, in looking over this set of books as a whole, that Mrs. Wharton's talent and power touch life and literature in a surprisingly varied number of ways, and that her ability is far from being restricted to a single class of subjects or to a single manner of writing. The illustration by Walter Appleton Clark is for the most part superior to that which appears in our day in novels. (The Novels of Edith Wharton. Uniform Edition. The Valley of The Descent of Man. Decision. The Greater Inclination. The House of Mirth. Crucial Instances. The Touchstone. Sanctuary. \$1.50 per volume for the first four; \$1.25 for the others. Charles Scribner's Sons, New York.)

Here we have an "Athanasius Sex and against the world, but in a no-Character torious rather than a noteworthy sense. The author, Otto Weininger, divides the female sex into the "mother type" and the "prostitute type," and in "the ethical point of view" places the latter "higher," regarding maternal love as "not true love ... not of moral origin." In his view woman "is merely non-moral." She is characterized by "shamelessness and heartlessness." Only man has a "share in ontological reality." "Women have no existence and no essence; they are not, they are nothing." It does not surprise us to be told that such a philosopher died by his own hand at the age of twenty-three. It does surprise us to find him taken seriously and even praised by newspapers in Germany, where his work

has passed through six editions. It is there said to be scientific, but his statement that "modern psychology is essentially womanish" is enough to stultify that claim. And now it has been thought worth while to put this preposterous charlatanry into an English dress! (Sex and Character. By Otto Weininger. G. P. Putnam's Sons, New York. \$3, net.)

Some Trinitarian
Forgeries
These "forgeries" consist in erroneous translations of Biblical texts.

Trinitarianism is, in the author's view, a "poisonous" and "bloody" doctrine. His argument is certainly handicapped by its rancor. But he makes some good points. Why should the Bible Society continue to print the famous passage about the Three Witnesses in heaven (I John v. 7), now universally acknowledged to be a late interpolation? (Some Trinitarian Forgeries Stated by a Monotheist. The Grafton Press, New York. \$1, net.)

Mr. Stratemeyer in his latest Under Togo boys' story takes some of his for Japan former characters to the Far East and places them, without much regard for probability, in the forefront of the Battle of the Sea of Japan, so that the reader at times wonders whether Admiral Togo or Larry Stryker was the real hero on that occasion. Like the author's other stories, this makes no pretense at literary finish but has action in abundance. It will probably please most boys. (Under Togo for Japan. By Edward Stratemeyer. Lothrop, Lee & Shepard Company, Boston. \$1.25.)

The third and fourth The Works of volumes of the Presi-Theodore Roosevelt dent's Addresses and State Papers of Theodore Roosevelt bring these papers down to the last Message of the President, December 5, 1905. We do not recall any other President whose state papers and public addresses have been of such a character as to call for publication in popular form for general reading. Roosevelt's intensity of conviction and popular sympathy, his masterful nature showing itself in his athletic style, and his high moral ideals combined with practical common sense, make these volumes valuable as literature as well as important as a part of the history of the country. We cannot understand how the publishers should have given them to the public without any table of contents. (P. F. Collier & Son, New York.)

Letters to The Outlook

SHIP SUBSIDIES

When you speak of the important bill for the restoration of the American merchant marine, which has just passed the National Senate, as "totally vicious in principle," you use strong and bitter language, and I think you owe those American citizens who differ with you the privilege of a temperate reply.

Let us take a specific instance: There are no American steam lines, no regular and efficient communication of any kind, between our ports and the chief ports of South America. American Ministers, consuls, merchants, and travelers unite in declaring that we can never have adequate trade with our neighbors until we offer transportation facilities equally as good as those provided through national aid by Europe. President Roosevelt, who approves this shipping bill and urges its immediate passage by the House of Representatives, says significantly in his recent message to Congress:

It cannot but be a source of regret and uneasiness to us that the lines of communication with our sister republics of South America should be chiefly under toreign control. It is not a good thing that American merchants and manufacturers should have to send their goods and letters to South America via Europe it they wish security and despatch.

The chief British steamship service to South America was created by a subsidy of \$1,350,000 a year—and another subsidy of \$200,000 has lately been given to create a new British cargo line to the West Indies. All the maritime world has found that regular and efficient steam communication cannot be secured at first without national assistance. Germany of recent years has given a subsidy of \$1,330,000 to a new line to Asia and Austria. Italy, France, and Japan subsidize everything afloat. The United States is the only nation which leaves its ocean carrying to the chance, half-hearted work of foreigners.

A majority of Congress agrees with President Roosevelt that this is "not a good thing "-that it is "a source of regret and uneasiness." The Outlook, on the other hand, protests that National aid to mail lines and to cargo ships, after the fashion of the pending bill, is "totally vicious in principle."

Is it "vicious" to offer a subvention of \$300,000 for an American steam line to Brazil, and \$375,000 for a line to Argentina?

Is it "vicious" to grant aid to lines of cargo ships, which, in the words of President Roosevelt, "are of even more importance

can be depended upon to furnish swift auxiliary cruisers in time of war "?

Is it "vicious" for the United States to endeavor to provide for its merchants, manufacturers, and farmers mail and freight facilities on the great trade routes of the world at least equally as good as those provided for their foreign rivals by the subsidies of foreign governments?

Is it "vicious"—" totally vicious in principle "-for the United States to seek by National subventions to create a naval reserve of auxiliary ships and seamen, the lack of which has just helped to ruin Russia and the possession of which has helped to save Japan?

On sober second thought, is it not manifest that The Outlook, in its hatred of protection. ism, has urged the free-trade theory to its reductio ad absurdum? If Great Britain can consistently expend \$1,500,000 a year on steamship subsidies to South America, cannot the United States, whose national rights and interests there are far larger, spend at least half as much? Nor can the terrible Dingley tariff be invoked—for while the British Government "taxes" South American coffee and cocoa, 98 per cent. of our imports from Brazil and more than 80 per cent. from all South America are free of duty.

> HARVEY D. GOULDER, President the Merchant Marine League.

[The Outlook did not say that the bill in question was totally vicious. What it did say was this: "The Outlook has repeatedly recorded its belief that the theory that the whole people may be taxed to provide bounties tor a comparative few carrying on one particular business is totally vicious in principle, and here reasserts the belief and applies it to the measure now in question." To any one who reads the entire paragraph it is perfectly obvious that the application to the bill did not include disapproval of mail contracts in which the service rendered is a fair return for money paid, nor for other payments in which there is a direct and positive compensatory advantage, nor was the question of a naval auxiliary reserve touched upon.-THE Editors.]

STREET RAILWAYS: BOSTON AND GLASGOW

In view of the great discussion that has been recently taking place in regard to municipal operation and ownership of street than fast mail lines, save so far as the latter a railways, I would like to give a few figures

Digitized by Google

comparing the street railways in Boston and Glasgow. These cities have a population of, roughly, 600,000 and 790,000, respectively. Thus Glasgow is almost a quarter again as large as Boston. In Glasgow the street railways are owned and operated by the city, and in Boston they are owned and operated by private corporations, with the exception of the subways, which are owned by the city and operated and leased by private corporations.

In Glasgow there are 150 miles of track, 682 cars, and 132,557,724 passengers carried each year. In Boston 440 miles of track, 4,594 cars, and 241,681,945 passengers carried each year. By this it is seen that Glasgow does not know anything about a large line. It is also seen that Glasgow should make a large profit when she carries so many passengers on such a small scale. The above figures were taken in the same year for both cities-and, although they may not be absolutely accurate, they are very nearly so, and the conclusions which I shall draw will not be affected by any inaccuracies which may exist. Boston runs lines which do not pay now, but which the company believes will pay when the suburbs build up, the new roads helping to build them up. Boston also runs cars ten miles into the country, Glasgow only about five. It has been said that the Glasgow fares are cheaper. The fares are I cent for half a mile, 2 cents for 21/2 miles, 3 cents for 31/2 miles, 4 cents for 4½ miles, 5 cents for 6 miles, 6 cents for 7 miles, etc. In Boston the fare is 5 cents for any distance—the maximum being 10 to 21 miles. Besides, the purchasing power of a halfpenny (cent) is greater than the purchasing power of a cent here. Taking all things into consideration—the purchasing power of a cent, etc.—we find the fares are higher in Glasgow. One result of the differences in the systems is that travel and moving to the suburbs is much greater in this country than in England. Mr. Donald, in his article in The Outlook for June 17, 1905, on "Municipal Ownership of Street Railways in Glasgow," states that "British people have not acquired the traveling habit to the same extent as Americans. A larger number of people want to travel a mile than to go five miles; but, unless the fares were low for short distances, British people would not take the cars." This may be so, and may be the reason for the city not extending its lines into the suburbs and trying to build them up. But the result of the differences in the systems is that we disperse our population while they do not. In 1891 33 per cent of Glasgow's population was living in one-room tenements. At the same time in Boston only 11/2 per cent. lived in one-room tenements. It can readily be seen that this has an important effect upon the health and morals of a city. It is well known that private corporations will take chances that the Government and city will not-as in extending lines out into distant suburbs with the hope of building them up and making the line eventually profitable. Few cities would agree to build railways which would have to be run without profit for a number of years, in hope of future profit. This is the difference between railroads in the United States as compared with railroads owned and operated by the Governments of a country abroad as Germany. In the United States corporations have built railroads hoping in time to develop the resources of the country, looking for future profits.

The reason I have not compared the Glasgow street railways with street railways of another English city owned and run by private companies is that under the conditions imposed in England on private companies hardly any one could run tramways.

This article is written to show a grave fault. In Glasgow doubtless the employees are better paid and have shorter hours than in Boston. But is it not better for us to have our population spread out through the suburbs and have private companies run our street cars, charging a uniform fare for either a long or short distance, than to have our population congested in the city, with the city operating the cars, and charging fares to suburbs so high as to be nearly prohibitory? R.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

THE OUTLOOK COMPANY

Chicago Office, 1436 Marquette Building

287 Fourth Avenue, New York

Trade Mark

THE BRIDE'S TROUSSEAU

This is the title of a dainty booklet which we have just issued in which is discussed this most interesting subject.

For over half a century we have been supplying what is best in Housekeeping Linens to the best people of the land. To-day we are preparing Housekeeping Outfits for the third generation of some of our former patrons, and since the addition of the Pansy Corset and Underwear Department, we are equipped to supply this more personal part of the trousseau as well.

Our long experience in preparing Bridal Outfits has made us very familiar with all the requirements of good taste, and all the minutiæ pertaining to the marking, making, and every other detail of importance connected with the successful completion of a Bridal Outfit.

The booklet illustrates a variety of Housekeeping Linens, Ladies' Underwear and Corsets, and gives detailed estimates of Trousseau costing from \$100 to \$2,500 each.

We shall be glad to mail this booklet free on request.

Suspension of Work in the Coal Mines

A widespread suspension of work in the bituminous and

anthracite coal mines of the country by members of the United Mine Workers of America was inaugurated last Monday by the National executive board of that organization. Upward of five hundred thousand mine employees are affected, and the suspension involves fifteen different coal-producing States. At this writing the prospects are that in the greater number of the bituminous coalmining States the suspension will be of short duration; while the situation as regards the early resumption of mining operations in the anthracite fields of Pennsylvania is clouded in uncertainty. The suspension in both the anthracite and bituminous mines is due to the fact that the agreements under which the men sold their labor expired on March 31 without representatives of the operators and mine workers being able to agree upon mutually satisfactory terms for a continuance of their relations. In the bituminous industry this disagreement marked the disruption, for the time being at least, of the Inter-State Joint Conference of the central competitive territory of Western Pennsylvania, Ohio, Indiana, and Illinois. This Conference had reassembled at Indianapolis on March 20, following President Roosevelt's request of the leaders of the operators and mine workers to try again to reconcile the differences which had resulted in their disagreement in January. But, as indicated in The Outlook of March 31, the operators' representatives split into two antagonistic factions, and their sharp discussion of the differences dragged the sessions of the joint conference up to March 29, when they finally adjourned sine die, without having come to an agree-

ment as to wages and conditions of employment in the mines of Western Pennsylvania, Ohio, Indiana, and Illinois, for the scale year beginning April 1. One faction of the operators, led by Mr. Francis L. Robbins, of the Pittsburg Coal Company, who practically controls the production of the Western Pennsylvania field, favored granting to the mine workers a restoration of the wage reduction of five and one-half per cent, which the miners had accepted in 1904, and which President Mitchell offered to the joint convention as the miners' compromise proposition. But the larger number of operators in Ohio, Indiana, and Illinois, led by Mr. J. H. Winder, President of the Sunday Creek Coal Company, refused to agree to any concessions whatsoever to the mine workers, and stood out to the very last session for a continuance of the scale of wages in force the past two Upon the adjournment of the joint convention without an agreement, the United Mine Workers of America reassembled their special National Convention, and outlined a policy in the emergency. Inasmuch as a number of the operators were willing to grant the demands of the mine workers, although it was contrary to the custom of the organization to sign agreements separately with the districts in the central competitive territory, President Mitchell in this instance advocated the policy of entering into separate contracts with all operators who were willing to grant for two years a restoration of the wage scale of 1903. It is this policy which may prevent the suspension inaugurated the first of the week in the soft-coalproducing States from developing into a long-drawn-out and widespread strike. It is believed that most if not all of the operators of the central competitive territory and of the other soft-coal-producing

Digitized by Google

States will within a short time sign agreements embodying the compromise wage increase.

The Mining Suspension and the Consumer

In the anthracite industry the operators are ar-

operators are arrayed solidly against the demands of the United Mine Workers for higher wages and shorter work days for the anthracite mine employees. Nor is there any prospect at this writing that they will recede from the sweeping refusal of all these demands contained in the reply of the anthracite-carrying railroad presidents made public on March 11. Nevertheless, another conference of the two committees of operators and mine workers began its sessions in New York on Tuesday of this week in response to a request of President Mitchell for a further consideration of the wage scale in the anthracite fields. At the same time, through the committee appointed by the Shamokin convention of last December, which is representing the anthracite employees in the conferences with the operators, President Mitchell ordered a suspension of work on Monday of this week by all anthracite mine workers other than those necessary to man the pumps and preserve the properties, "inasmuch as after April 1 there will be no contract or agreement between anthracite miners and operators." President Baer characterizes this order as "most extraordinary." Despite efforts on the part of the mine superintendents in the three fields to offset the force of the suspension order and to keep their mines in operation as usual, the mine workers throughout the entire region quit work pending the result of the New York conference. If this fails to enter into an agreement to take the place of the award of the Anthracite Coal Strike Commission which expired on Saturday of last week, the present suspension is likely to develop into a strike affecting seriously the annual production of anthracite coal and again plunging the country into a repetition of the direful experiences of 1902, when the anthracite employees were on strike for nearly six months. In the meantime the retail coal dealers in some of the large Eastern cities like New

York and Philadelphia have already begun to advance the prices of the different sizes of anthracite, an action which, in view of all the factors, The Outlook regards as indefensible. The cost of coal per ton has not yet advanced to these retail dealers, and yet they are already beginning to take advantage of the consumer's fears as to the supplying of his fuel necessities. Such extortion, along with the growing conviction among many that the price of anthracite to the consumer is already too high, should be an incentive for the consumers as a class to begin action looking to the protection of their interests. As long as the mine workers were weak and defenseless in the absence of a strong organization, we have seen how they were exploited by the operators through low wages, in extortionate prices for powder, through the "company" store, by means of systems or methods of mining and docking, and by various other schemes of exploitation whose operation has been checked through the mine workers organizing for their self-protection. From the exploitation of the wage-earner the producers of coal have the past three years turned to the exploitation of the unorganized and defenseless consumer by increasing the price of coal. Justice and fair dealing cry out against a continuance of such intolerable conditions. The present interest of the public in the coal mine labor situation and a continuance of extortionate prices for anthracite should be an incentive to efforts for the protection of the consumer.

(3)

In a speech the Is the Hepburn Bill other day at Hart-Comprehensible? ford, President Mellen, of the New York, New Haven, and Hartford Railway, declared that there is not one man in fifty but believes the purpose of the Hepburn Bill, now pending in the United States Senate, is to put a stop to rebates and discriminations. Mr. Mellen added that not one man in fifty has either read the bill or comprehends what it contemplates. Mellen admitted, however, that railway power is certainly too great to be permitted longer to be exercised in the public interest without more restraint. "Directors do not always direct, officials are not always competent, power long exercised makes men offensive, autocratic, and arbitrary, and stockholders, employees, and the public suffer and pay the bill." But—

Our transportation interests are so vast, their power for good or evil so tremendous, and the public has so great an interest, that it should never permit such power to rest in the hands of any set of men except under carefully guarded restraints as to the exercise of that power. . . . What the effect would have been upon the business of this country had the present Inter-State Commerce Commission possessed the authority it is so urgently seeking at the present time, with the record of above ninety-five per cent. of its contested decisions reversed by the courts, can better be imagined than described.

President Roosevelt, said Mr. Mellen, advised of wrongs perpetrated by carriers, wishes to prevent the possibility of their recurrence. "In this purpose we should all hold up his hands and give him our support, and no one is more loyally disposed to do his utmost than myself." The speaker recommended, therefore, legislation to eliminate preferences and discriminations and to require the frequent examination of books, records, and accounts. When he reads the Hepburn Bill, however, nominally prepared for such purposes, he finds therein little to do away with rebates and discriminations which existing laws, if enforced, may not successfully accomplish: the bill seems to Mr. Mellen mainly directed to securing authority to interfere in the carriers' management. For instance, the bill contains a provision intended to force the carriers to contract among themselves for through routes.

The carriers are compelled by their charters to carry persons and property at reasonable rates, and they have spent their money to put themselves in position thus to do, but they are under no obligations beyond their own lines, and I do not believe that there is any warrant in equity or justice in attempting to assume a liability beyond their charter limits.

Perhaps the New York and New Haven Company is somewhat sensitive regarding any through-route proposition; allowing for terminal charges, if its rates were as low proportionately as those of its con-

necting lines, New England would enjoy a different railway tariff system than it now has. President Mellen declares with greater justification that the bill not only "prescribes the accounts, records, or memoranda to be kept by the carriers;" it also provides that "any carrier who keeps any other books, accounts, or memoranda than prescribed by the Commission is guilty of a misdemeanor and subject to fine or imprisonment, or both, in the discretion of the Court." The warrant for this is, of course, as Mr. Mellen admitted, the desire of the Commissioners not to have a carrier appear before them with any data other than that in their possession, from which conclusions may be drawn contrary to their own. However, complained the speaker,

Of what possible advantage is it to the public that a carrier should be prohibited from keeping such accounts, records, and memoranda of its business as may appeal to its officers as an advantage in keeping a check upon and record of its operation, so long as all records are kept that the Commission may desire?

Senator Knox on Railway Rate Regulation

President Mellen's criticism on the lack of a

specific judicial review clause in the Hepburn Bill was emphasized last week by a notable speech in the United States Senate from Mr. Knox, of Pennsylvania. It attracted an audience which tested the capacity of the Senate Chamber to the utmost, to listen to one who as Attorney-General had brilliantly and successfully conducted a case in the Supreme Court of "the people versus the corporations," namely, the Government's case against the Northern Securities Company. the first time in many years a Pennsylvania Senator brought his State up to a level with the highest position held by other States-Wisconsin, for instance, as represented by Mr. Spooner. Knox holds that "the power to fix railway rates is a legislative power, and that, when the legislature has laid down a rule for the establishment of rates, its application to specific cases is a matter of administration which may be delegated to a commission." The Inter-State Commerce Commission, now without power to enforce its orders, should have the right to declare what should be a just, reasonable, and fairly remunerative rate in place of the one declared to be unreasonable, the order to "take effect in such reasonable time as shall be prescribed by the Commission, . . . and should be final, subject only to attack for unlawfulness in the Federal courts." "Railways have a constitutional right to just compensation for services rendered," and cannot be deprived of that right. "An act which prevents a judicial review . . . of the question of the reasonableness of an order of the Commission would deprive the carriers of this constitutional right, and would therefore be unconstitutional." Mr. Knox's ground for his belief that the bill as it stands deprives the railroads of their constitutional rights is difficult to understand. Apparently, however, he argues that the only way by which a test case can reach the court after a decision by the Inter-State Commerce Commission is to have the railway continue its condemned rate and have the shipper appeal to the court to sustain the rate made by the Commis-In our judgment, this method would be placing a very unfair burden upon the shipper; and it is, as Mr. Knox correctly states, practically prohibited by the Hepburn Bill. For, under the terms of the bill, any railroad which persists in maintaining a rate contrary to the order of the Commission shall be fined five thousand dollars for each offense, and for a continued offense, five thousand dollars a day. Senator Knox does not, it seems to us, however, make it clear why the burden may not, under the bill as it stands, rest upon the carrier, who, while obeying the order of the Commission as to the new and lower rate, may sue the individual shipper for what the carrier deems to be a just balance due on freight charges. Discussing the differences which have thus far prevented agreement between those who demand and those who oppose a specific provision for a court review, Mr. Knox declared that-

Both sides agree that the right should exist; one holds that it is in the bill or exists independently; the other that it is not in the bill, but should be; and yet the former, for some

mysterious and unaccountable reason, objects to an amendment which would place the mat-ter beyond doubt. When we consider that the people are asking for prompt, decisive, and effective action; that the present bill distinctly contemplates a review; that its constitutionality is seriously threatened by failure to provide for such review if the other features are to stand; that precedents of State legislation are in favor of a review; that all the bills presented in either house provide for or recognize a review; that this bill itself as presented in both houses, and as originally prepared by the Inter-State Commerce Commission, contained a provision for review, and that the President in his message speaks of the orders being subject to review-when we consider all these facts, the action of those who are willing to imperil the validity and effectiveness of this law by not explicitly providing for a review for no valid reason whatever, is to me incomprehensible.

Naturally, Mr. Knox discussed the section in his own bill which provides for a review by the courts of the Commission's orders, and argued against the suspension of those orders by interlocutory decrees without requiring a cash deposit or a bond to secure to the parties entitled to repayment the difference between the Commission's rate and the railway rate, if the former were sustained. As we have already said when Mr. Knox first made this proposition, if the words "or a bond" were omitted, we are inclined to believe that the proposition would expedite rather than delay the ultimate result. But as against the contentions of both Mr. Mellen and Mr. Knox it appears to us that the burdens involved in establishing and maintaining new rates should rest upon the railways and not upon the shipper.

•

A Revised Chinese Exclusion Law Unless considerable public pressure is brought to bear upon individual Congress-

men, there is too much danger that the excellent Foster bill to regulate Chinese immigration will be defeated by the hostility of certain political influences of the Pacific Coast, and by some of the labor organizations. This bill, introduced by Representative Foster, of Vermont, last January, and understood to embody the views of President Roosevelt on Chinese exclusion, clearly and in our judgment

admirably draws a much-needed distinction between the Chinese laborer and the Chinese merchant, traveler, or student. It prohibits the immigration on any pretext of laborers, and says that that term shall be "construed to mean both skilled and unskilled manual laborers, including Chinese employed in mining, fishing, huckstering, peddling, laundering, or those engaged in taking, drying, or otherwise preserving shell or other fish for home consumption or exportation;" it protects laborers now legally living in the United States, and provides that in any arrest, hearing, or trial the Chinese laborer accused of illegally coming into the country shall be entitled to all the rights and privileges provided by the laws and constitution or enjoyed by the citizens or subjects of the most favored nation; it gives the Chinese seeking entry the right of appeal from the immigration officials to the United States courts; and it affirms that all Chinese persons not excluded under the act shall enjoy for the protection of their persons and property all the rights of travelers from the most favored nations, except the right of naturalization. Certainly this bill protects the Pacific Coast and the American laboring man as carefully as can be desired by the most timid believer in the "yellow peril." It also establishes the status of the Chinese coming to this country with a definiteness which the Chinese Government has been very reasonable in desiri It is useless to talk about the revival of our trade with China or the education of Chinese as engineers, army and naval officers, merchants, and statesmen in the United States until the Foster bill or a similar one is passed.

•

The Senate

Senator Lodge's recent speech in defense of the Senate was timely, but it is unfortunate that it did not meet more specifically certain charges against the Senate which are regarded by a great mass of sober people as proven, and have sensibly diminished the regard in which that body is held. Of the presence of a number of men of ability and integrity in the Senate there is no question; but it is a

great misfortune that a body which is in the habit of regarding itself as the most important legislative body in the world should have had three of its members under indictment for felonies within two years; that it should count among its members a few men who are very gravely and for good reason distrusted by their fellow-citizens; that it includes altogether too many managers of political machines who control the entire political organization of their States; that a small group of Senators stand together too definitely for business in politicsthat is to say, for that "system" of interweaving business and political interests which more than any other single thing has corrupted and lowered the tone of our public life; that it is altogether too intent on maintaining and widening its own privileges, and that it has expanded this power in the matter of appointments beyond the limits intended by the Constitution on the one hand, while it has encroached, on the other hand, on the functions of the House of Representatives. These are grave charges; they are not to be lightly dismissed. The country has seen one treaty after another, carefully worked out by the State Department for the purpose of securing freer relations with other countries, shelved by the Senate—a body which, by reason of its important connection with the foreign policy of the country, and of its own assumption of power in that department, ought to have great regard for the higher and freer tendencies of American life, and ought to do everything in its power, by breadth of view and foresight, to cement relations between the United States and foreign countries by the application of a liberal policy. The feeling of the country in regard to the Senate was expressed by one of the most disinterested and able men in public life not long ago when he declared that every attempt on the part of recent Administrations to foster more friendly relations with other Powers was defeated by the captiousness and jealousy of certain Senators; and by another man of the first distinction in public life, who in various positions has had rare opportunity of knowing, when he said, "The United States Senate is a body of gentlemen whose chief interest is to preserve and enlarge their personal privileges." These are not captious criticisms; they represent the opinion of a very considerable body of Americans who are distressed by the popular feeling toward the Senate, but who believe that the only way to change that feeling is, not to defend the Senate in speeches, but to remove the causes of popular suspicion. In our judgment, nothing can more effectively remove these causes than the election of Senators by popular vote, thus making them directly answerable to their constituents; and there is strong reason to believe that public opinion is gradually but unmistakably coming to this conclusion.

Important steps were The Preservation taken last week at of Niagara Falls Washington in the campaign for the preservation of Niagara The report of the American Section of the International Waterways Commission was sent to Congress on Tuesday, with a special message from President Roosevelt, together with letters from the Secretary of State and the Secretary of War, including memoranda showing what has been attempted by the Department of State in the effort to secure the preservation of the Falls by treaty. The report of the Commission recites that "the total quantity of water to be taken from the river by works now authorized is 60,900 cubic feet per second. Of this amount 26,700 cubic feet is to be taken on the American side. and the remainder, 34,200 cubic feet, on the Canadian side. That is, 27 per cent. of the average discharge and 33 per cent. of the low-water discharge of the Niagara River will cease to pass over the Falls when these works are completed and in full operation. The quantity to be diverted is more than double the quantity which now passes over the American Falls, which at the average stage is about 27,800 cubic feet. That this will in general have an injurious effect upon the Falls seems selfevident." The recommendation is made by the Commission, and earnestly indorsed by the President, that legislation

be at once enacted containing the following provisions:

The Secretary of War to be authorized to grant permits for the diversion of 28,500 cubic feet per second, and no more, from the waters naturally tributary to Niagara Falls, distributed as follows: Niagara Falls Hydraulic Power and Manufacturing Company, 9,500; Niagara Falls Power Company, 8,600; Érie Canal or its tenants (in addition to lock service), 400; Chicago drainage canal, 10,000. All other diversion of water which is naturally tributary to Niagara Falls to be prohibited, except such as may be required fc: domestic use or for the service of locks in navigation canals. Suitable penalties for violation of the law to be prescribed. The foregoing prohibition to remain in force two years, and then to become the permanent law of the land, if in the meantime the Canadian Government shall have enacted legislation prohibiting the diversion of water which is naturally tributary to Niagara Falls, in excess of 36,000 cubic feet per second, not including the amounts required for domestic use or for locks in navigation canals.

The report fully recog-

An International

nizes the responsibil-Matter ity of the Nation for the preservation of Niagara Falls, and the significant sentence, "It is to be remarked that none of the diversions have been sanctioned by the United States Government," is a very definite hint that, in view of the position of the Niagara River as a navigable stream and as an international boundary, the Secretary of War has present authority to halt the diversion of water on the American side. There is also evidence that Canada is becoming aroused, not only to the impending scenic desecration, but to the more tangible fact that the power to be produced on the Canadian side has been principally sold for American use, leaving but little for home development. A proposition has been advanced at Ottawa to place an export tax upon such use, in order to provide for Canadian home development. It has been similarly suggested that an import duty might be imposed by Congress on electric power produced in Canada and transmitted to the United States, the basis of the tariff being the ostensible protection of Amer-All this points the necessity ican coal. of international consideration, which has been undertaken through the regular diplomatic channels,

Sensational newspa-The New York pers, case-hardened Insurance Situation politicians, and sensitive but unintelligent moralists have been doing all they could during the last two or three weeks to confuse the mind of the public concerning the insurance situation in the State of New York. " Judge" Andrew Hamilton, the "legislative agent" of the New York Life Insurance Company, who is generally believed to have fled the country to avoid crossexamination by the Armstrong Committee, has returned from Paris and has made a public statement before the Legislature full of scandal, imputation, and innuendo, but containing very little if any definite information, and absolutely no evidence not already brought out fully by the Armstrong inquiry. He defended all the monetary actions of the late John A. McCall, but implied that many of the trustees of the New York Life were guilty of dishonorable conduct. His speech was flamboyant and personal, and scarcely deserves notice except for the fact that it inflamed still more the anger of the public against the managers of the three great companies involved. In the meantime District Attorney Jerome had been preparing cases against individual insurance officials. As a result George W. Perkins, a member of the firm of J. Pierpont Morgan & Co., and recently Vice-President of the New York Life Insurance Company, was arrested last week on the charge of grand larceny, the specific act of alleged larceny being the payment of about fifty thousand dollars for the New York Life to the Republican National campaign fund of 1904. Jerome, in spite of much newspaper clamor, is right in asserting that this arrest should be regarded as purely tech-Its purpose is to find out from the Court of Appeals whether campaign contributions made by corporations are The proposed Armcriminally illegal. strong legislation will make them so, but certainly such contributions have been so general in the past as to raise the question whether they have been considered by the courts as illegal, although the public conscience now regards them as totally pernicious and desires to have them defined hereafter as criminal. In

the face of much violent discussion of Mr. Perkins's character, Mr. Jerome's motives, Mr. McCall's supposed martyrdom, and various other personal incidents, it is wise to keep the mind clearly fixed on the real accomplishments of insurance reform so far. The three great companies involved have been proved to be rich and solvent—thus their policy-holders are at least in a safe situation; the public conscience has been aroused and standards of financial morality and honor have been distinctly raised; many insurance trustees and officers have been shown to be grossly blunt in their moral perceptions and to have ethically if not criminally violated their trusts; some of them have been terribly although justly punished by society; the law has been set in operation for their legal punishment if they have broken the law; and, lastly and most important of all, expert and carefully framed legislation is in process of discussion at Albany to provide against the repetition of the evils exposed by the investigation. We advise our readers to keep their eyes fixed on Senator Armstrong and the Legislature and not permit themselves to be turned aside from the main work of insurance and corporation reform by attacks, either for reasons of personal revenge, class hatred, or journalistic sensation, upon individuals.

₩

The Armstrong Committee's Insurance Bills

The first of the insurance bills intro-

duced by the Armstrong Committee passed both Houses of the New York Legislature last week without a dissenting vote in either body. The bill provides that the terms of office of all the directors of the mutual life insurance companies in New York State shall expire on November 15 next, when the annual meeting of each company shall be held for the election of a new board. new boards of directors shall at once elect new officers of their corporations. The bill will affect the New York Life Insurance Company, the Mutual Life, the Security Mutual, and the Mutual Reserve Life. It was pushed through the Legislature in advance of the other bills in order to forestall the annual meetings of the New York Life and the Mutual Life, which would have been held this month. The present boards of directors of these companies will now continue in office until November 15. Provision is made for elections held under the supervision of the Superintendent of Insurance, with three policy-holders of each company, appointed by him, acting as inspectors of election. proxies secured prior to September 15 of this year shall be valid for voting at these elections. By this provision and by making a complete sweep of the present managements of these companies the Legislature has given to the policy-holders every opportunity of securing control of the companies. The Committee, after a careful consideration of the suggestions and objections made by the insurance interests, presented the revised draft of its other bills to the Legislature last week. The most important provisions are retained unaltered—publicity of accounting, the prohibition of political contributions and secret lobbying, the limitation of the amount of new business, the prohibition of deferred dividends, and the elimination of stock investments—and the only changes in other respects are in details rather than in principle. section providing for a contingency reserve fund is so modified as to increase the percentage of the value of their policies which companies having more than \$75,000,000 of insurance outstanding may retain; it also permits them to maintain a special reserve fund, with the consent of the Superintendent of Insurance, to meet some anticipated emergency or fluctuation in value; provided, however, that this consent is obtained annually. The much-criticised provisions for the limitation of the amount that may be spent in obtaining new business and of the commissions paid to agents have been made more definite and more liberal, and it is asserted that the objections of the companies and the agents have been satisfactorily met. In the matter of investments a single concession is made, in the provision that companies now holding collateral trust bonds are permitted to retain them, although no others may be purchased in the future. The bills, in their present form, seem to The Outlook not only admirable in spirit, but skillfully planned to preserve the best in the life insurance business as it now is, and to make it safer, stronger, and more equitable. The Committee, throughout its labors, has steadfastly kept in mind the principle that in life insurance the interests of the policyholder (which are inseparable from those of the beneficiary) are paramount; and their recommendations for legislation have been framed with the single end in view of conserving this principle.

Mayor Weaver's appoint-In Philadelphia ments to the Civil Service Board under the Gable Civil Service Bill give assurance of an efficient, sympathetic, thoroughgoing establishment of the merit system in Philadelphia. old Philadelphia machine under Durham and McNichol thrived because of its practically unlimited control of the municipal patronage. After Mayor Weaver's break with the "organization" he placed the Hon. Frank M. Riter in charge of the civil service system as it then existed. The laws under which he had to work were inadequate and the rules equally so, but through his public spirit and persistency he brought order out of chaos and has given to the city an admirable Mayor Weaver and the administration. Civil Service Reform Association, however, feeling that the condition depended too much upon one man, united in asking the Legislature to give the force and effect of law to the work which Mr. Riter had inaugurated. The Legislature responded with the Gable Civil Service Law, which was satisfactory alike to the Mayor and to the Association. It is a complete and comprehensive act providing for the appointment by the Mayor of a Civil Service Commission composed of three men, with five years' term of office. It requires the appointments of candidates from the four highest on the eligible list and a probationary period of three months. The exempt class is reduced to the lowest possible minimum, and every safeguard which experience has demonstrated to be necessary has been thrown around appointment to office. Political considerations are excluded, and

the old-time "pull" of local politicians and bosses eliminated. Moreover, no person can be transferred to any position subject to a competitive examination unless he shall have previously passed an open competitive examination equivalent to that required for such position. The Commissioners appointed by Mayor Weaver were Mr. Riter, who was made President of the Board; Cyrus D. Foss, Ir., son of Bishop Foss of the Methodist Church, and Secretary during the past year of the City Committee of the City party; and Dallas Sanders, a Democrat of independent proclivities. All three men believe in the merit system, and may be depended upon to give satisfactory administration of the law. Weaver is making a strenuous effort to complete the filtration plant in Philadelphia, work upon which has been suspended for months past to enable the experts to investigate the character of work already done and the charges of graft and corruption in connection with its construction. Major Gillette, of the Engineering Corps of the regular army, has charge of the investigation. The Mayor was anxious to have him receive a leave of absence to enable him to complete the plan, but the manipulation of Senator Penrose and his followers in the Congress defeated this proposition; whereupon Major Gillette resigned his commission in the army to accept the position of Chief of the Filtration Bureau. and from now on will give his entire time to completing the work. In the meantime there is renewed talk of prosecutions in connection with the matter. The old contracts with McNichol and Durham have been annulled, and new ones will shortly be made. The Philadelphia "Press" pointed out that the charge of forgery against former Superintendent Hill failed because the trial judge ruled that the change of the records by the engineer with the approval of his superior officer was not a forgery. however, did not give a clean bill of health to the filtration business, as the report of the experts showed that the city paid \$18,000,000 for what should have cost \$12,000,000, and the people of the city are burdened with the difference.

Springfield, Ohio, has no A Travesty on cause for complaint if it Justice is hereafter known as a lawless community. It is bad enough that the city has permitted the existence within its borders of the "Jungle," a notorious neighborhood abounding in vice and disorder; it is worse that the city has permitted, twice within almost exactly two years, an irresponsible mob of boys and roughs to burn and smash saloons and hovels; but it is disgraceful beyond words for the community, acting in its corporate capacity as a dispenser of justice, to treat such an occurrence flippantly. That is exactly what Springfield, Ohio, has done. Of the boys arrested and put on trial for rioting several were convicted. Eight of the jurors petitioned that the penalty be one dollar fine and costs for each offender. Some of these jurors offered to pay the fines themselves. If there could be any surer method of bringing ridicule upon criminal proceedings, it is apparently unknown in Springfield, Ohio. If American liberty is in danger, it is from the lax government and disregard for law of which Springfield, Ohio, has now on two occasions given an almost incredible exhibition. The whole matter was so palpable a travesty of justice that the judge before whom the case was tried, rather than be a party to it, remitted the fines altogether.

No more revolution-The Germ of an ary bill has been English Revolution introduced into the British Parliament for years than the Land Tenure Reform Bill accepted by the Liberal Government. If passed, it may mean the beginning of an upheaval in the whole English economic and social structure. Its appearance, however, is mild. In England the word "farmer" implies the word "tenant." The English farmer does not cultivate his own land, but the land of another. The American farmer who improves his farm enriches himself; the English farmer who improves the land enriches his landlord. The English farmers, therefore, belong to a dependent class. This bill would enable them to take a first step

toward independence. It provides that a dispossessed farmer shall be adequately recompensed for the permanent improvement he has made in the farm he has rented. This provision, of course, tends to security of tenure, as do other provisions of the bill, such as those prohibiting the eviction of tenants for religious or political views, allowing compensation for damage done to crops by game which the tenant is forbidden to kill. and the like. This measure has been dubbed "the farmers' charter." announcement of the fact that the British Government is ready to take up the land question, which lies at the bottom of all of England's economic perplexities. It is noteworthy that Mr. Agar-Robartes, who introduced the bill, belongs to the landlord class, for he is heir to a peerage. In connection with this bill, the statement made by Mr. Asquith, Chancellor of the Exchequer, to a deputation from a conference of taxing authorities, is important. He announced his belief in two principles:

The first is that those who specially benefit by public improvements should contribute their fair share to them; and the next is that it is right and just that the community should reap the benefit of increased values which are due to its own expenditure or its own growth.

These, of course, are the principles upon which the "single tax" is based. If they form a part of the Liberal platform, the Liberal party is committed to as far-reaching a reform as ever was undertaken in England. Its method may not be "single tax," but its object must be just as radical. In the case of this bill the Government takes the position that the increase in the value of land belongs, not to the man who owns the land, but to the man who creates the increased value. From this there is but one step to the position that the increase in value of land due to the growth of a community belongs, not to the owner of the land, but to the community, and therefore may justly be appropriated by the community. The London "Spectator" expresses the conservative view of this bill by its words of caution: "It must never be forgotten that injudicious legislation might impose an intolerable burden on the landlords." The obvious retort is that if equitable conditions are hopelessly obstructed by the landlord system, then that system ought to go.

Last week throughout Rus-The Russian sia elections took place for **Elections** choosing electors who in turn are to choose the members of the Duma or lower house of the Russian . Parliament. The first session of the first Russian Parliament is convoked for May 10; the date should be a notable one in Russian annals. members of the Duma are to be elected by provincial congresses composed of representatives now being elected by four classes of voters—the muzhiks, or peasants, who have attained a certain standing; the industrials, or wage-earners, who have worked at least six months in an establishment employing not less than fifty men; landowners who represent a certain amount of property, varying from a large amount in the north to a comparatively small amount in the south (the possession of vast estates, however, does not entitle the landowner to more than one vote); finally, the urban population, as distinct from the industrials. In the last-named division. however, certain cities, like St. Petersburg, Moscow, and Odessa, elect a number of representatives directly, instead of by the provincial congresses. Last week's record would indicate that the urban population of the St. Petersburg district had given its vote almost entirely to the Constitutional Democrats, who have thus apparently made good their claim to be "a party that does something" (a claim vigorously denied by the revolutionaries). At the head of the Constitutional Democratic ticket stands Professor Miliukov, well known here as a lecturer at the University of Chicago. As their name implies, the Constitutional Democrats favor a constitutional monarchy on a democratic basis, universal suffrage, and local selfgovernment. Evidencing aggressive vigor, the elected delegates from this party have already pledged themselves to demand that the Duma shall hold the Premier, Count Witte, personally respon-

sible for any act of repression committed

since the publication of the Imperial Freedom Manifesto, October 30, 1905. The only provincial election which has so far taken place is that of the province of Kostroma; it is interesting to note that three priests, six professional men, eighteen merchants, nineteen noblemen, and no less than forty-six muzhiks were returned. The muzhik representation is likely to be more able and efficient than might be supposed, since, in great part, the muzhiks have chosen as delegates to the various provincial congresses the present village elders and members of the communal courts.

₽

As to the outlook for Par-The Russian liamentary legislation in Duma Russia, the chief ground for optimism lies in the fact that free speech has at last been granted, even if, in the Duma, such speech may not concern itself with certain subjects relating to obvious opportunities for bureaucratic "graft"—titles of nobility, entailed estates, charges of malfeasance, etc. Speech may also be checked by the provision that if the Czar rejects a bill passed by Parliament the subject is not to be brought forward again during the same session, and any bill rejected by one of the legislative bodies requires Imperial consent before being again introduced. To make good the lack of legislation, the Czar may promulgate temporary laws. He may also dissolve Parliament at will. Finally, the Cabinet is not to be responsible to the Duma; interpellations of Ministers are to be practically suppressed, and the power of impeachment is withheld. These restrictions are intensified by the necessarily conservative character of the Council of the Empire, the Upper House of Parliament, but not really a representative second chamber; it is not, of course, the old bureaucratic barrier long interposed between monarch and people in Russia, but it is still a barrier. On the other hand, the Duma may enter a few fields of legislation with the Council, from which further power may and should be obtained for the lower House matters relating to stock companies, to the State railways, to any alienation of State property or receipts, above all, to

jurisdiction over the budgets—whether of Ministers or of the Empire—and the report of the Imperial Comptroller. This sounds decidedly like the beginning of a change in the control of the power of the purse in Russia—the vital element in any parliament, and especially in any parliamentary lower house. Towards this conclusion foreign as well as domestic influence has been a factor. Despite the Finance Minister's recent statement that most of the large sums loaned last autumn by the Government to private banks have been repaid, that there is now a great increase in savings banks deposits and in popular confidence as to the Government's financial stability, the French bankers, who have been hitherto Russia's chief financial resource, have refused further advances unless Parliament shall ratify all former loans from foreigners and also the proposed new loans. avert collapse, Russia must shortly borrow a huge sum. Autocracy's necessity has been democracy's opportunity. France offers friendly help to democratic, but no longer to autocratic, Russia. is a notable tribute to the anticipated personnel of Russia's first Parliament that French bankers consider its guaranty a sufficient security for a new loan. Even if it had come about in no other way, out of Russia's financial crisis may be born, perforce, a constitutional Russia.

Which Kind of Spirit Lost America to England? Bismarck once said that South Africa would be the grave of the British Em-

pire. That prophecy has not yet come true, though it was frequently quoted during the first year of the Boer War. South Africa will be the grave of the present British Cabinet, prophesy some of its opponents. In truth, since the advent of the new Ministry, many British South Africans have been positively exasper-In the Cape Colony indignation is expressed because of the recent resolution passed in the House of Commons, which really amounted to a censure of Viscount Milner, the late efficient High Commissioner for South Africa. In the Transvaal the British (not the Boers) resent the Imperial Cabinet's attitude regarding Chinese labor. And last week the Natal Cabinet resigned because of an alleged unwarrantable interference by the Imperial Government in Colonial affairs. Last February a party of police was engaged in collecting the native Armed natives resisted the poll tax. collection and killed some British offi-The native outbreak became so serious that martial law was declared. Order was restored only after a punitive expedition of several hundred carbineers with artillery had been despatched to the scene of the trouble. The tribe which had made the greatest disturbance was condemned to lose part of its territory, to pay a fine of twelve hundred cattle and thirty-five hundred sheep and goats, while of the natives arrested and court-martialed twelve were sentenced to be shot. At the court, composed of five militia officers, the prisoners were legally represented. The sentences were confirmed by the Governor and by the Natal Ministry. On this Lord Elgin, Colonial Secretary, cabled to the Natal Premier ordering a suspension of the executions pending a consideration of the sentences by the Imperial Government, contending, it is assumed, that the offenses were committed before martial law was proclaimed, and that hence the prisoners ought to have been tried by a civil court. The Premier curtly refused to obey the order, but the Governor postponed the executions. Thereupon the Natal Ministry immediately resigned. The situation was certainly a delicate one. In Natal the indignant colonists held mass-meetings of protest against a procedure which, they claimed, would endanger the safety of the entire white population, not only of Natal, but of all South Africa. In England the general subject afforded each side opportunity to accuse the other of the kind of spirit which lost to England her American col-The only question would seem to be. Which kind? The contest was between anti-imperialists and imperialists rather than between Liberals and Conservatives, for there are imperialists in both of the great political parties. The antiimperialists, whose attacks have latterly been focused on Lord Milner, accused him of a spirit estranging the Boers and the natives by imperialistic methods akin to those made famous in our own history. On the other hand, the imperialists similarly denounced the spirit which would inspire the Government to interfere with the rights of free British colonists.

6

Unlike the British Govern-The Crown ment a hundred and thirty and years ago, the present Gov-Martial Law ernment saw that it had unintentionally driven one of the most loyal colonies into well-nigh open revolt, and hence, with fidelity to the Liberal tradition of non-interference with Colonial authority, Lord Elgin cabled a despatch to the Governor of Natal saying that the Imperial Government never had any intention of interfering with the Government of Natal or of controlling the Governor in the exercise of his prerogative; in view of the presence of British troops in the colony, however, the Imperial Government was in duty bound to obtain precise information about martial law cases, with regard to which an act of indemnity must ultimately be assented to by the Crown; in the light of the information since furnished, the Imperial Government recognized that the decision of the matter rests in the hands of the Natal Governor and the Natal Cabinet. Commenting on this, even the Government supporters appear to find themselves hard pressed to justify Lord Elgin's first action, the "Chronicle" saying, "The Cabinet has shown good intentions but bad judgment." However this be, a comparison of the South African situation with that of the American colonies, whether stated by the imperialists or their opponents, seems to us misleading. In the present case it is true, as it was not true a hundred and thirty years ago, that certain British colonists are charged with oppressing those who have no other protector than the Imperial Government.

Nefarious
Business
Some interesting and alarming facts have recently been brought out at a legislative hearing in Albany in regard to the giving away of dangerous drugs for the

purpose of disseminating a taste for them. At this hearing, and later in a signed article in the New York "Tribune," Mr. William Jay Schieffelin, one of the most prominent of the younger citizens of New York, declares that there are drug-stores which give away cocaine for the express purpose of creating customers for that dangerous drug, and that over twenty per cent. of the cocaine now manufactured in this country is used for illicit purposes. The "Tribune" calls attention editorially to evidence recently brought out that manufacturers of so-called catarrh cures which contain cocaine are distributing free samples of their preparations on the sidewalks in order to foster the cocaine habit, and that they are being successful in this nefarious business. It has long been known, and it has recently been established by indubitable proof, that many medicines which are advertised as free from alcohol contain large percentages of that substance, and that other medical preparations widely advertised and used contain opium, morphine, narcotic and other dangerous and sometimes poisonous drugs. Some of the preparations sold at the soda-water stands in drug-stores in all parts of the country and used in immense quantities are very deleterious to health. It is not too much to say that a large number of people are taking alcohol under other names, and that the practice of using dangerous drugs has become alarmingly prevalent. In view of these facts and of the widespread adulteration of drugs, the effort to secure the passage of a statute requiring manufacturers of all medical mixtures which contain alcohol, narcotics, or dangerous drugs, except those for external use, to affix in all cases a label which, in plain English, shall give the composition of the mixture and the percentage of dangerous elements used in it, ought to be crowned with success. It is difficult to imagine why any honest druggist should oppose it. It is unnecessary for a State to await the passage of a National Pure Food law before protecting its own citizens. Indeed, excellent as is the bill now before Congress, it cannot under the Constitution apply to other than inter-State commerce and importation from abroad. This is, therefore, a matter that needs drastic State legislation.

Chemistry and the World's Food

Under this title Professor Robert Duncan, whose article in

The Outlook on "Modern Alchemy" many of our readers will recall, writes in "Harper's Magazine" of a serious danger threatening humanity, but which chemistry stands ready to avert. is nothing less than the rapidly diminishing amount of "fixed" nitrogen-that is, nitrogen united with other elements so that it is active and useful in the world's work. Of "free" nitrogen there is abundance, for over every acre of land, as Professor Duncan points out, there are contained in the air 33,880 tons of nitrogen. The problem is to transform "the free and useless nitrogen into the fixed and useful kind." Nitrogen is as necessary to plant life as oxygen to animal life, and upon it depends the growth of food products like wheat, and, indirectly, also of the world's meat supply. Now, the consumption of "fixed" nitrogen is much larger than its supply through natural causes. the land becomes exhausted—that is, deficient in nitrogen—we supply the need artificially. But here, too, with an increased demand there is a diminishing supply; of the natural manures only a small part is available, and even though the world shall realize the enormous waste in this respect now going on through the sewerage systems of great cities and otherwise, the problem cannot thus be solved; Peruvian guano was the first substitute nitrogen fertilizer used in quantities, but there is practically no more guano—the land has "eaten it up;" now we are using a by-product of coaltar distilleries (limited by the nature of the process, and not a hundredth part of what is needed) and Chili nitrate of soda or saltpeter; of the last, 1,453,000 tons were produced in 1900, three-quarters of which were used for plant-food, and, enormous as are the niter-beds, Professor Duncan estimates that in twenty years this source of nitrogen will be used up like the guano. Where, then, are the wheat-grower and cattle-raiser to turn for plant-food? One source was

explained some time ago in The Outlook, in an account of the process of "inoculating the soil "introduced by Professor Moore, of the Agricultural Department. Briefly, this consists in helping the development of the tubercles found on the roots of some kinds of plants, for these tubercles have the power of transforming and absorbing into plant life, to some extent, the free nitrogen of the air. This is, however, still in an experimental stage and applies only to a limited number of vegetable products—not, for instance, including wheat. Can, then, the fixing of nitrogen into useful form out of the atmosphere be accomplished by chemical process and with commercial success? On this problem great manufacturing concerns, especially in Germany, but also in America, have been at work for years, have employed men of the highest scientific skill, and have expended large sums. Several processes have given results, and it is now well established that nitrogenous plant-food can be made artificially. One such product, called by the Germans Kalkstickstoff, comes from calcium-carbide (the substance from which, when thrown into water, evolves acetylene), and is said by Professor Duncan to be an almost ideal fertilizing material. The illustrations which Professor Duncan presents with his article of plants raised with and without this fertilizer are very striking. Its introduction into general use will depend upon its cost as compared with the fertilizers now available; and as the latter increase in rareness and value and the world's demand becomes greater, it seems certain that this and other substitutes will be manufactured on a large scale and commercially. Professor Duncan adds: "It is demonstrated that we may look forward with a very reasonable assurance to the creation of as many factories for the fixation of elemental nitrogen as we have smelting furnaces for the fixing of elemental iron." Thus, he adds, "the disaster of which the world actually stood in imminently deadly peril has been averted." The whole discussion is fascinating in its analysis of the application through business sagacity of pure science to universal necessities.

The Moral Upheaval

One of the latest students of contemporary conditions in this country is Admiral Sir C. A. G. Bridge, whose comment on "A Great Moral Upheaval in America," in a recent issue of the "Nineteenth Century," is sympathetic, comprehensive, and intelligent. The writer stands far enough away from America to group together the phenomena which together express the promise of a new ethical life in this country. He groups together a series of facts which indicate, not sporadic revolts here and there against corruption, but a widespread revival of ethical enthusiasm and the generation on a great scale of ethical power. He finds the revolt against the boss and the machine, which has not only been effective in a number of States and cities, but is steadily spreading throughout the country, one phase of the movement against corruption. The investigation of the great insurance companies, pushed on, he says, "with almost relentless fervor," is another. It was not initiated, nor has it been conducted, to disturb in any way the financial stability of these great organizations, but to strengthen them by securing sound methods, protecting policy-holders, and preventing the improper use of gigantic sums of money. The report of the Armstrong Committee was a fine example of courageous thoroughness of method combined with a constructive spirit in the matter of legislation. In the movement against the laxity of divorce laws in different States Admiral Bridge finds another phase of the moral upheaval, and it is interesting to note that he does not make the mistake of rushing to the conclusion that the number of divorces in this country means disregard of the proprieties of life or a widespread degradation of the On the contrary, he affirms that "nothing is more offensive to Americans in general than anything tending to the degradation of the home;" and he finds significance in the fact that the kind of clever comment about marital infidelity and kindred subjects, which in other societies is accepted as a proper subject for humor, is frowned upon by the great mass of Americans. In the protest against brutality and commercialism in college athletics this English student of our conditions discovers another phase of the advancing standards of the country.

Whether the inspiration of these widespread revolts against corruption and low standards of personal and business conduct is to be found in the fact, as Admiral Bridge holds, that men and women scattered all over the United States, eager for purity of life in all its phases, have lacked leadership and cohesion and have now found a leader in President Roosevelt, may be open to dispute. It is quite certain that the universal confidence in the integrity of the President is an immense factor in the general movement, and that his conspicuous and aggressive integrity has given impetus and courage especially to young men in all parts of America. This influence is seen in the increasing numbers of young men of ability and character who are going into public life; and Admiral Bridge declares that "the opinion once widely held in England, and sedulously inculcated by a host of American writers, that in the United States decent people will have nothing to do with politics, if ever it was true, is now as much out of date as would be the opinion that scrofula can be cured by the royal touch." He is convinced that the proportion of men of intelligence, character, and independent circumstances entering political life in the United States is as great as in any other country, and that it tends to increase.

The moral upheaval, however, does not depend on any one man, nor does it owe its increasing vigor and its promise for the future to any single career. It is the result of forces which have been at work for years past, and of a growing sense of the necessity of what Mr. Kidd calls "civic self-sacrifice." Americans have long been restive under machine politics; of late years they have been ashamed of their subservience; at last they have become willing to pay the price of driving the boss out of public life and of separating the government of the country from its business interests. More than one "boss" of large ability (and it has happened many times that "bosses" have been lacking in moral

insight and vigor rather than in intellectual capacity) has discerned of late years the disastrous results of what Mr. Steffens calls "the system"—that is to say, the steady and growing seizure of the political life of the country for commercial purposes—and has deplored the tendency as one of danger. This is at the root of the greater part of our moral disorders in public and private life, of the failure of individuals and the inefficiency of the Government; and it is against this corrupt combination between business and government that the country has risen in revolt. It is weary of influence and pulls and backstairs management; of having Mr. Odell decide who shall be Governor of New York, and Mr. Aldrich make up his mind in advance what legislation shall be permitted to go through Congress. It has determined that the men into whose hands as trustees and directors great sums of money are placed shall not treat their positions as if they were mere opportunities for private speculation and moneymaking; that the men at the head of the party organizations shall not parcel out important positions as the spoils of politics without regard to public inter-In other words, it has determined that the United States shall lead a decent moral life; that the public shall manage its own affairs; that legislators shall regard its will and not the will of irresponsible masters: that the men to whom great interests are committed shall guard those interests sacredly, or shall suffer definite punishment if they are traitors to their trusts.

The moral upheaval in America is the truest and most beneficent kind of a revival of religion; for what is needed even more than the filling of the churches and the swelling of gifts for religious purposes is honesty in dealing, man with man; a deep and quick sense of responsibility of the public servant to the public that trusts him; and a quickened conscience on the part of every man who holds the relation of a trustee to a group of men or to the community. It is the social conscience which has been touched, and the revival now in progress means, not primarily the saving of individual men from their sins, but the redemption of great communities and the reinvigoration of the moral life of States.

If the investigations now in progress were to end in simple disclosure of evil conditions, they would serve no better purpose than the furnishing of sensational newspapers with material of the sort which lends itself to "scare" headlines; they must lay the basis for constructive moral action. The Outlook hopes, in its next issue, to indicate some of the results already attained which seem to it to mark the end of a period of agitation and the beginning of permanent reform.

Morocco

The decisive action of the Moroccan Conference last week makes a review of the situation timely. For centuries the military, political, and commercial worth of Morocco's geographical position at the northeast corner, so to speak, of Africa has been apparent. The history of the Moors, however, has contradicted their natural advantages; Morocco has always stood for barbarism rather than for civilization; and in self-protection it has often been necessary for the nations to consult together concerning proper courses of action. The country most affected by chronic Moorish disorder is naturally the neighboring Algeria, for the best part of a century under French control, and with an extremely creditable record. The Moroccan-Algerian boundary is many hundred miles long, and for much of the distance has never been surveyed through the shifting desert sands. Marauding Moorish bands have been accustomed to raid and pillage at pleasure; when caught, they often claimed that they were not in Algeria.

An international Moroccan conference of all the European Powers was held in 1880 at Madrid, and the United States Government was represented. In April, 1904, however, France, as the Power chiefly interested, entered into agreements with England and Spain by which, on proper guarantees, France was empowered to introduce, if she could, certain reforms in Morocco. England and Spain were naturally parties to these

agreements because they are both Mediterranean Powers.

While these agreements practically gave to France a free hand in Morocco, they received, in general, favorable comment from the press. In March, 1905, however, the German Emperor, in the course of a Mediterranean trip, touched at Tangier, the principal port of Morocco. and delivered an impressive speech to the representatives of the Sultan of that country, in which the political and commercial independence of the little empire was emphasized, and the Kaiser declared himself its champion. The German Government also informed France that the agreements were contrary to international principles; that, while France had special interests in Morocco, these did not carry with them special rights of interference with the sovereignty of an independent State; that, as one of the parties to the Madrid treaty, Germany had a right to be consulted: and that, if any reforms were to be recommended to or imposed on Morocco, all the Powers, acting in council, should agree upon them and not one Power acting alone, with the evident intention of turning Morocco into a French protectorate, and of repeating there the exclusive commercial policy which had largely kept the nations from trading with Tunis, Madagascar, and some other French colonies. As a result of long negotiations, France declared that she had always respected and would respect the Sultan's sovereignty; that she never intended to close Morocco to foreigners; that the increasing danger to Algeria compelled her to take vigorous measures, not only to protect her own subjects, but also the many travelers from other nations; that it was her right and duty to protect in the best manner and by every possible way; finally, that she had no hesitation in placing this programme before an international conference.

Such a conference met in January at Algeciras, the nearest European port to Morocco. Among the subjects considered, the principal ones were a proper control over contraband goods; a general tariff for Morocco; an international police; and the establishment of a Moroccan State bank. These points at

issue have now been settled, though neither France nor Germany gains all that those Powers desired to gain. France expected to make Morocco practically a French protectorate, as England has Egypt; the action of French agents in Morocco has confirmed this supposition. But while disappointed in this ambition, she comes out of the Conference with an international acknowledgment of her claim to special rights following special territorial, administrative, and financial interests in that particular sphere; the control of the police of four important ports, and the control, with Spain, of the police of two others; the sanction of the Conference to the French claim to a greater share in the Moroccan State Bank than is to be given to the subjects of any other Power. France has also gained a great point in keeping intact the Anglo-French friendship.

On the other hand, the extreme policy of the restless and energetic German jingoes—as announced by the German Colonial Society and by the Pan-Germanic League, but never confirmed by the Kaiser—was to get control of one of the Moroccan ports and also of important commercial concessions. The Kaiser's desire, however, as expressed, was, while preserving the Sultan's sovereignty, to establish the "open door," and, in general, to "internationalize" Morocco. The calling of the Algeciras Conference itself was a signal triumph for Germany. She succeeded also in giving united international emphasis to the Sultan's sovereignty and to commercial equality, in compelling the French to admit the Spanish to the control of the Moroccan police. which the former had hoped to have exclusively, in influencing the Conference to allow Spain two ports for her exclusive police control, and, finally, in compelling France to subordinate the entire police of Morocco to an inspector, who shall report to the diplomatic corps.

France and Germany have both made gains and losses by the action of the Conference. The world at large has gained a great point in the settlement of the dispute by an international conference at which all Powers interested have been represented. Not only is the peace of Europe preserved, but civilization is

advanced by the adjustment of international differences touching the sovereignty even of a savage State, not by a syndicate of Powers chiefly interested, but by a world tribunal.

⊕

A Lenten Meditation

And when a third time the evil spirit had been repelled and the Christ had kept his consciousness of power in perfect integrity for the mission of revelation and redemption on which he came, suddenly the tempter vanished and ministering angels encompassed him. Then for the first time the stainless purity and beauty of his nature disclosed itself; for it is the company our spirits keep that makes us known to our fellows. The spirits of evil and of good throng about us on this mysterious journey we call life, and the affinities of our souls are shown in the selection of those to whom we throw open the doors and make ready the house. If spiritual things were suddenly made visible, we should see the door of every man's spirit approached by those who come with good or evil in their hands, and what we call character is simply a definite and deliberate selection and rejection become habitual. The Christ was not alone in this mysterious experience of temptation, nor in its outcome; in some guise, at some time, every man bars or opens the door of his soul to visitors from heaven or hell; and when one group departs from the closed door, the other enters. They come trooping in, the unseen visitors who encompass us; and what we are and are to be is settled by the barring or the opening of the door.

So searching were the temptations which assailed the Christ that when they found no place of entrance, and the stronghold of the spirit impregnable, they departed never to return. In those hours the spirit of evil lost the one decisive battle in the history of humanity; its forces were to be rallied a thousand thousand times; it was to win here and there brief triumphs, to waylay and make prisoners numberless weak, unwary, or willing spirits; but its hope of ultimate victory went down to rise no more in

the battle in the desert. The Christ had still his life of suffering, loneliness, and sacrifice before him, when the evil spirit left him never to return; but henceforth, whenever his real companionships were made visible to men, he was in the company of angels and they were ministering to him. For the spirits of evil are not shut within the place called hell, nor the spirits of good in the place called heaven; they walk beside us on every path, are about us in every kind of work, and dwell with us in every home. When the hour of transfiguration came, the Christ was not changed; the veil was drawn aside for a moment, and men saw him as he was. In like manner, if the veil were drawn aside, we should be seen dark or luminous, according to our natures, and in the companionship of the ministers of darkness or of light.

Temptation always forces a definition of aims and compels a selection of companions; and every temptation resisted involves a clearer view of what life means to us, and every closing of the door against evil an opening of the door to good. The Christ had become conscious of his relation to his Father, and of the mighty power at his command; under the pressure of temptation he was brought face to face with the alternatives between which every man must choose—the service of God or of self; and when, in that searching of his heart and testing of his spirit, he had made his choice, straightway peace and strength stood beside him. never again to leave him, even when a momentary mist of agony swept across his vision in the last terrible loneliness.

It is part of the mystery of evil that it evokes the good; that when it is driven from the door, good comes up the path and enters in its place. In spite of a thousand apparent triumphs, evil is the servant of good and prepares the way for its approach. If the door is opened, evil takes possession, and the home becomes an unclean place; but if the bolt is shot in its place, it is disarmed and impotent. Against the virtue of a man who has shut the door of his soul and barred it against the solicitations of temptation evil has no weapons, and stands with empty hands in the presence of that which it is neither able to understand nor to destroy.

When the Christ sent the evil spirit to its own place, he not only kept the integrity of his mission intact, but he unmasked the enemy for all time to come, and put victory in the hands of every man who chose to accept it. is the fate of evil constantly to thwart its own plans and invite its own defeats. For when the good man is assailed, he not only wins the day, but gains strength for the next day; more than this, he sounds the alarm and puts his fellows on guard. The solicitations of evil were not only repelled by the Christ, but they were compelled to disclose to him their own vileness and hollowness. and they drew from him those great words which have become the inspiration of all who fight against unright-It is the fate of evil not eousness. only to have the doors closed by the good man, but to evoke a defiance which rings far and wide with a resonance that sometimes wakes half a world out of its In every age, when evil has intrenched itself in society or government, it has assailed men with the temptation to ease and comfort through acquiescence and silence, and this pressure has opened their eyes, compelled decision, and set forces in motion which have swept like a devouring fire through dens of vice and destroyed in a day strongholds of iniquity which seemed to be impregnable.

When evil approaches great natures. not only are the gates closed but a bugle rings across the world and startles the idle and sluggish into action. When the Christ repelled the evil spirit, he not only closed the doors of his spirit against all sin, but he sounded a note of warning and victory that will vibrate as long as men are tempted. In the darkest and loneliest hour of trial, when a man seems to be fighting for his life in an awful solitude and beyond the reach of help, let him remember that an angel stands beside him waiting to minister to him if, by shutting the door against his enemy, he opens his house to the messenger of heaven; for we are always in charge of His angels if the homes of our spirits are open to them.

The Spectator

If the Spectator had Times change. been traveling to the new Nevada gold diggings five years ago, when they were but just discovered, he would have gone in on a four-horse stage, à la Bret Harte, or a six-mule team, plodding patiently over the desert dust. Twelve or fourteen hours would have been necessary on the stage route, and half a dozen relays of horses. To-day the visitor takes a big automobile instead, and whizzes among the sage-brush and cacti as comfortably as on Fifth Avenue, making the trip from train to mines in six hours. The journey is more expensive than on Fifth Avenue, it may be remarked in passing-twentyfive dollars per passenger, "the most expensive regular travel in the United States," as the town boasts; but, then, that is only a part of the high price of everything in this desert land, where even ordinary laborers command four dollars a day. Aladdin's lamp has been rubbed in the desert, and water-works, ice plants, electric lights, trolleys, automobiles, telephone, and telegraph have appeared as if by magic, and have to be paid for at fantastic rates, accordingly. But who grudges the luxuries of civilization in a land where gold and silver underlie the streets? Not the modern Nevada miner, who, it may be added, is usually quite familiar with them, being a different miner from him of the old Comstock days.

The new mines are, actually, a part of the great Comstock "zone," their dis-The man who stumbled coverers assert. on them, and made Tonopah and Bullfrog and Goldfield and Searchlight and the rest a Mecca for the gold-seeker, was a believer in the theory that the Comstock lode continued somewhere through these Southwestern deserts. He was an active citizen, being both the district attorney and the superintendent of schools of Nye County, and as he traveled through the desert trails with a pack of six burros to visit an outlying camp, he took samples of a promising outcropping, like a true prospector. That was in 1900. the Pullman car and the automobile replace the burro, and the bad water,

the coarse food, and the desert hardships of the old-time prospector and miner are like a receding nightmare of the past. Yet in the old Comstock days these wonderful mines would have been worth nothing to the finder. They are not bonanzas in the old Nevada sense. treasure-chamber like that marvelous Arabian Nights one in the Comstock that made the fortunes of Flood, Fair, Mackay, and O'Brien can be shown to the visitor here. Bullfrog, the newest and some say the richest camp, is still not up to the old traditions at all. This desert ore is low grade. Worked in the old fashion, the more the miners worked, the more they would lose. cyanide process has changed all that, The Spectator was told that at least fifty million more could have been extracted with this process from the low-grade ore which the Comstock miners threw away.

⊕

The Spectator realized this continually in mine and mill, as he was taken through them. Let no man go down in a gold mine nowadays expecting a romantic trip. It is as prosaic as a coal mine, and quite as damp and uncomfortable. The ore does not sparkle to any extent, nor is "pay dirt" a glittering affair. It is dug out, for the most part, like coal, from its seam, though the body of ore, unlike that of coal, is not usually very large or wide. Loaded into car or basket, it is drawn up on a framework resembling a coalbreaker, tilted out, crushed as it goes down, and dropped into cars—trolley or mule drawn—which take it to the stampmill or the smelter. The Spectator does not understand the technical processes of the stamp-mill, but he saw the stuff between the stamps and over "tables" where a stream of water deposited it on the mercury-covered sides and bottom as an amalgam. tables are cleaned every day, and golden results obtained. Everything in the mill is cleaned, and the gold is extracted even from towel and wash-basin, as well as from the tailings. Gold, silver, and copper all mingle in the ore, and though the copper is separated, the gold and silver are not, but compose together the pale-yellow metallic bricks, slightly over

ordinary size, which are sent from the mines to the San Francisco mint, in the end, to have the gold and silver separated and to be transformed into bars of bullion. The brick the Spectator saw and lifted weighed fifty-four pounds and was worth some twelve thousand dollars.

æ

Indeed, the old Bret Harte types were nearly all absent. The miners were young men, most of the successful mineowners and managers being under thirty. Dr. Osler would find his views justified in the Nevada desert. Some of these young Napoleons of the gold-fields have been miners in the Klondike and in South Africa; others never knew what a prospect was till they came here. One man was born in a mine, his parents having taken refuge there against Indians. The Spectator sat next a very pleasant and attractive woman at dinner one evening, who told him how she had walked to the Klondike in its early days, sharing the hardships of her husband, who failed there, but had won success in Nevada later. On the other hand, next day he was entertained by a young couple, the husband a mining engineer from the East, who had introduced some modern inventive ideas and was reaping the benefit of them, and the wife just graduated from an Eastern college. It is an interesting society, getting all the while more successfully civilized, yet containing too many men of the adventurous type to be by any chance dull. The desert dust, the desert heat, the desert isolation, are all parts of its environment, and the dry, stimulating desert air makes these energetic Americans, men and women, more energetic still.

6

There is a field for energy, especially where the success of the miner is not yet assured. The newcomer of the slender purse, to obtain shelter and live, resorts to interesting inventions. The distillate oil-can, an oblong tin affair in which the oil for the engines is sold, has become recognized building material. Filled with the desert stone—for the Nevada desert is not sand, but fine stones, like a road not yet gone over by the roller—it becomes a substitute for

bricks, and builds up, without mortar, into thick and secure walls. Cut open and flattened out, then nailed shingle fashion, it forms a good roof, though given to unearthly rattling when the wind blows, and making a flurry of rain sound like a charge of cavalry above the house-For this reason, perhaps, holder's head. a far larger proportion of miners live in "rag houses" instead-frames with white canvas stretched on them like tents, but larger and more permanent. Such dwellings hang on the fringe of the stone and brick and frame buildings that adorn the town, and the dwellers in them confidently expect to have handsome houses of their own before they get through. Hope is the atmosphere of the mining town—as stimulating as the dry, brilliant air that bathes the glowing mountain peaks beyond the wastes of sage-brush.

(A)

While the Spectator was there the unexpected happened in the desert-it rained. The wastes of broken stone, with their queer Doré-like vegetation of cacti and greasewood and Spanish bayonet and "Joshuas" (a sort of hedgehog or monkey tree whose name not the oldest miner can explain), were thoroughly moistened, and then a thing more unexpected still took place-the desert blossomed. Up from every foot of it sprang tiny plant and leaf and flower. As far as eye could see there was a gay, quickly laid fairy carpet of rainbow hues. Under the sapphire sky and the exquisite desert sunset it was a vision of beauty. then-rain and blossom were alike forgotten, and the bright, familiar bareness of plain and peak was resumed. But the Spectator hopes that it was only a prophecy of what will some day come to stay. when the mines that first brought man to the desert are worked out and forgotten. as in California, and yet the greater riches of the soil, worked, like the longdespised low-grade ore, by new aids of science, shall astonish and attract the farmer. At all events, to have seen for one day the desert blossom as the rose is to have caught, as in a parable, a glimpse of the vision of infinite hope, and to be attended by it down all the dusty ways of East and West hereafter.

CHINA IN TRANSITION

REASONS FOR CHINA'S WEAKNESS

BY GEORGE KENNAN

Special Correspondent of The Outlook in the Far East

MONG the first things that impress the observant traveler in - China are the poverty of the people and the weakness of the Government. In an Empire which comprises more than five million square miles of fertile and productive land; which contains three or four hundred million thrifty, temperate, hard-working people; and which has inherited an ancient and in some respects complex and highly developed civilization, one would naturally expect to find prosperity, wealth, and almost irresistible national power; but what one does find is a state of poverty which from the Western point of view seems to be only one remove from starvation, and a national weakness which is so great as to be absolutely pitiful. The common people—or an overwhelming majority of them-live upon earnings which would hardly keep American workmen in coffee and tobacco. while their Government is so feeble and incapable that it cannot command the respect of its neighbors, does not dare to resent or resist injustice, is compelled to tolerate foreign interference in its purely domestic affairs, and is wholly unable to defend its territory against the aggressive, land-grabbing nations of the West. With a population equal to that of all Europe, and a soil almost as rich and productive as that of the United States, China has a smaller national revenue than the Netherlands and is far less capable of self-defense than Turkey. Before we can forecast the future of such a country, form a judgment as to its power of self-regeneration, or estimate rightly its attempts at reform, we must understand the evils to be remedied and the reasons for their existence. How did China come to be in her present condition, and what causes have brought about

the poverty and weakness from which she is now suffering? When we can answer these questions correctly, we may be able to form a trustworthy judgment as to the suitability and adequacy of the reform measures which she is now taking, and to forecast in a conjectural way their probable result. I purpose in this article to point out what seem to me the principal causes of China's poverty and weakness, and then, in a later paper, I shall try to describe the methods of remedy and reform that Chinese rulers are adopting, and shall consider their probable efficacy and value.

1. The weakness of China as a State is due, first of all, to her lack of national unity and solidarity. She is generally and popularly supposed to be a homogeneous Empire, with a single despotic head and a strongly centralized form of bureaucratic administration; but she is in reality a weak aggregation of semiindependent principalities, each of which governs itself and merely pays annual tribute to the nominally supreme ruler at Peking. The Emperor, it is true, appoints the viceroys and governors of the eighteen Chinese provinces, and is supposed to direct and control them: but, as a matter of fact, he allows them so much discretionary power that they not only rule their respective dominions with the authority of semi-independent sovereigns, but often decide questions which affect the welfare of the nation as a whole, and which ought to be decided by the Emperor himself. An interesting illustration of this is furnished by the attitude of the southern and central viceroys during the Boxer outbreak of 1900. It was clearly their duty to go to the aid of the Emperor and assist him in preserving order and defending the capital; but instead of doing this

Digitized by Google

they assumed the power and authority of independent sovereigns and entered into what was virtually a treaty with the foreign consuls at Shanghai. the terms of this treaty, which is historically known as the "Yangtse compact," they bound themselves to remain at their posts and preserve order in their respective provinces regardless of the plight of the Imperial Government. As Mr. Jernigan (our late Consul-General at Shanghai) justly remarks, "The fact that a viceroy could assume an obligation of such a sovereign character and carry it out only proves the weakness of the central power when it does not accord with the interest of a viceroy to recognize it."

The Chinese, as a people, seem to have no clear conception of the value of solidarity and political unity. one of the eighteen provinces organizes, equips, and controls its own army; every one has its own financial system and makes up its own budget; and almost every one coins its own money. In theory they are all subject to Imperial supervision and control; but in practice each of them is an independent administrative unit and has its own military, fiscal, penal, judicial, and educational machinery. It may readily be seen that such a system of government must tend to encourage localization, prevent the development of a truly national spirit, and obstruct every attempt of rulers and people to co-operate, broadly and effectively, in the attainment of Imperial ends. Take, for example, the working of this system in the field of military affairs. Every province has its own army, and every army has its own methods of organization and drill and its own distinctive equipment; so that one provincial force cannot possibly combine or cooperate with another for the accomplishment of a national purpose. How can an empire have any offensive or defensive power when eighteen different viceroys, with the assistance of eighteen Tartar generals, drill and equip eighteen separate armies in eighteen different ways? Lord Beresford says that in taveling through China and inspecting the troops of the provincial authorities he counted no less than fourteen different types of military rifle.

For another and an equally instructive example of harmful decentralization take the matter of coinage. Half a dozen viceroys, in different parts of the Empire, are now busily engaged in making money (in two meanings of the words) by minting ten and twenty cash pieces of copper. As the bullion value of these coins is much less than their face value, the manufacture of them is a profitable industry, and every viceroy is striving to get into circulation in his own province as many of his own cash as possible, and at the same time to keep out all competing coins of similar kinds and denominations made by the viceroys of other prov-In this inter-provincial struggle for illegitimate profit no attention whatever is paid to the currency requirements or absorbing capacity of the people who use the cash, and the over-production of irredeemable token money soon leads to depreciation. Bankers, money-changers, and speculators then try to carry these copper cash from a province where the depreciation is great to another province where the depreciation is less; and the viceroy of the latter, in order to protect the output of his own mint, arbitrarily stops the importation of them. the last four months the province of Shantung has boycotted the copper money of Kiangsi; Viceroy Chou-Fu, of Nanking, has addressed a strong financial remonstrance to Viceroy Chang-Chi-Tung, at Wuchang, protesting against the latter's flooding the country with irredeemable copper coins; and Vicerov Yuan-Shi-Kai, at Tientsin, has prohibited the importation of ten-cash pieces into Chili from any other province whatever. The fifteen provincial mints, meanwhile, are turning out, or preparing to turn out, token money at the rate of 1,745,000,000 pieces per annum, and the copper cash, which are the currency of the people, are depreciating in value so rapidly, as a result of over-production, that in a year or two the taxes and living expenses of a peasant family, computed in taels, will be nearly doubled. How can any country hope to attain a position of financial strength when it allows the necessities or greed of local officials to override in this way every consideration of sound national policy?

2. Another reason for the poverty and weakness of China is the almost universal prevalence of official dishonesty. A central government, in order to be prosperous and strong, must have sufficient revenue to maintain a large army and an efficient navy, to promote popular edu cation, and to carry on public enterprises and works; but it cannot possibly get money enough for these purposes if it allows its servants to steal four-fifths of the taxes. The Imperial Government of China long ago permitted, and still continues to tolerate, a system which makes it absolutely necessary for its employees to steal in order to live. When an official, of any grade, receives a salary which will not cover more than onequarter of his legitimate office expenses, he must, necessarily, either resign or steal. As a matter of choice, he usually adopts the latter alternative, and quiets his conscience with the reflection that if the Government had not expected him to steal, it would have attached to his office a salary large enough at least to pay for clerical assistance and stationery. Take, by way of illustration, the case of a viceroy. According to Mr. Holcombe, our late Secretary of Legation at Peking, the necessary official expenses of a Chinese viceroy—not including remuneration for his services—are at least \$50,000 a year, while his salary and legitimate allowances amount, in the aggregate, to only about \$6,000. What, under such conditions, is he to do? he be a fairly honest man, he probably makes a liberal estimate of his expenses and the value of his personal services, takes the necessary amount out of the provincial treasury by some indirect method of "squeezing," and forwards to the Imperial Government at Peking all that may happen to be left. If, on the other hand, he be a consciously dishonest man-as most Chinese officials are—he bribes his superiors, or sends them a sum which he thinks will be satisfactory, and "squeezes" all the rest. The latter method, of course, is the usual one, and it is practiced not only by the viceroys, but by most of the eighteen governors, seventy-five intendants of circuits, one hundred and eighty departmental prefects, thirteen hundred dis-

trict magistrates, and thousands of treasurers, tax-collectors, salt-examiners, village chiefs, yamen-runners, and petty officials of all sorts. The stream of money collected from the people in taxes diminishes steadily in volume as it flows toward the throne; and when it finally empties into the Imperial treasury at Peking, it has dwindled from a river of perhaps \$300,000,000 to a comparatively small brook of \$50,000,000. All the rest has been diverted by irrigating canals of official peculation and has been used for the refreshment of private The money thus diverted is not boldly and openly embezzled—it is taken indirectly by what is universally known in China as a "squeeze." A yamenrunner, for example, goes to a peasant farmer owning four acres of taxable land, and offers to certify, officially, that the farm contains only three acres, provided the owner will make him—the yamenrunner—a present equal to the tax on half an acre. As the tax on three acres, plus the tax on half an acre, amounts, in the aggregate, to a tax on only seveneighths of the land, the farmer pays the "squeeze" to the yamen-runner for the sake of saving half the tax on the acre not reported. The yamen-runner then divides the "squeeze" with the tax-collector, and the transaction is completed. The farmer has saved the tax on half an acre, the two officials concerned have pocketed the tax on another half-acre, and the Government has lost the tax on a whole acre. The amount in a single case is insignificant: but inasmuch as there are millions of such transactions, the loss of the Government in the aggregate is very great.

To take another class of cases: The land tax in China, although collected in copper cash, is assessed in silver taels, and a dishonest governor or district magistrate can always get a "squeeze" out of the rate of exchange. If he collects taxes from the farmers in cash at the rate of 2,400 to 1, and remits these same taxes to his superiors in taels at the rate of 1 to 1,200, he is able to pocket

¹ Yamen-runners are petty officials attached to government offices of all grades. They serve as messen gers or constables, and are generally detailed for the outdoor work of the bureaus or offices with which they are connected.

as much as he turns in, and he often does even better than this. In the province of Shangtung, a few years ago, the officials collected taxes in cash at the rate of 5,600 to the tael, when the rate of exchange was really only 1,500 cash to the tael. Such "squeezes" as this would hardly be possible if China had a stable currency, but in the present chaotic state of her monetary system the ratio of value between cash and taels is continually varying, and an ignorant farmer, whose taxes have been assessed in taels. may not know what sum he ought to pay in the copper cash which are the only currency he has. But even if he does know, he generally submits to the "squeeze," because, unless the demand is outrageously extortionate, it is safer to pay than to resist. In cases of this kind it would be just as easy, of course, for the dishonest official to rob the peasant farmer directly by doubling up his taxes without any reference to cash and taels: but such is not the Chinese method. Taking money without a pretext is stealing; but taking money with a pretext is merely a "squeeze." A theft is more or less disgraceful; but in a "squeeze" the robber "saves his face."

As the accounts of Government officials in China are never audited or published, there is no possible way of ascertaining the difference between the amounts collected from the people and the amounts turned into the various treasuries; but there can be no doubt whatever that a sum equivalent to at least three-fourths of the revenue of the Empire is annually "squeezed." Offices are continually bought, and the high prices paid for them show that they afford extraordinary opportunities for personal enrichment. The salary of the taotai, or intendant, of the Shanghai circuit is only 3,000 taels per annum, and yet it is reported that 100,000 taels have been paid for three years' tenure of the taotai's place. A prominent member of the Shanghai Municipal Council told me, a few weeks ago, that the Chinese judge of the Shanghai Mixed Court, who was dismissed last year, went into retirement with a fortune of \$1,750,000 gold, which he had made, in his judicial capacity, out of "squeezes." The sale of public offices

as a means of obtaining revenue is openly authorized by the Government, and no longer ago than last November, Chao-Erh-Shun, the Viceroy of Mukden, received permission from the throne to raise funds by the sale of positions and official ranks in the province of Fengtien.

That the policy of the Government in selling offices and permitting "squeezes" is absolutely suicidal there can be, I think, no question. Sir Robert Hart, the veteran chief of the Chinese Customs, told me when I was in Peking that the present land tax alone, if honestly collected and turned into the Imperial treasury, would suffice to pay generous and even extravagant salaries to the whole body of civil service employees; would maintain an army and a navy in a state of real efficiency; would provide for public education and public works on a liberal scale; and would then leave a large surplus for extraordinary improvements and miscellaneous betterments. He thought that this tax alone ought to produce 400,000,000 taels per annum, which is nearly five times the revenue that the Empire now derives from all sources. He had made an effort, he said, to induce the Government to try, in a single province, the experiment of paying adequate salaries and punishing severely every official who accepted a bribe or resorted to a "squeeze;" but he had met with no encouragement. During my stay in Peking, Baron Komura, the Japanese Minister of Foreign Affairs, came there, at the head of a special embassy, for the purpose of negotiating a new treaty. It is reported that when some of the high Chinese officials asked him one day what he thought they should do to be saved, he replied, briefly: "Enforce honesty in your administration and straighten out vour finances."

3. A third reason for the poverty and weakness of China is a moral deficiency which may be imperfectly described as a lack of civic virtue. The government of the Empire is far more liberal and democratic than that of Russia, and the people generally are cheerful, patient, temperate, and wonderfully industrious; but neither in the Government nor among the people can one find the characteris-

tics which have given power and distinction to the Japanese-viz., courage, patriotism, civic pride, loyalty, and great capacity for self-sacrifice. The average Chinese is industrious and easily governed, and to that extent he is a good citizen; but all the strings of his character are stretched over the bridge of self, and in office or out of office he would never think of sacrificing his personal interests for the sake of the public good. spends half a lifetime in the study of the Chinese classics, with a view to qualifying himself for a Government position; but his ambition as a public man is not to advance the interests of his country, nor even to gain personal glory and distinction, but mainly, if not solely, to get his hands elbow-deep into the public purse. The Chinese official may never have heard the saying, once widely quoted and commented upon in the United States-" The public be damned !"-but he does not fail to act in accordance with the spirit of it. If, at the end of his official term, he has succeeded in amassing a fortune at the public expense, he regards his career as eminently successful and satisfactory.

A little more than thirty years ago the distinguished Japanese patriot Saigo conceived a plan for the conquest of Korea, and in order to provide his Government with a reasonable excuse for declaring war, he proposed to sacrifice himself by going to Seoul as an Ambassador and allowing the hostile Koreans to put him to death. In a letter to Count Itagaki, asking the latter to get the Emperor's permission, Saigo wrote as follows:

If you are going to resolve on the despatch of an armed force in advance of an Ambassador. I have some doubts as to the advisability of such a course, for the Koreans will be sure to protest and demand the withdrawal of our troops, and non-compliance with this means the opening of hostilities. In that case the responsibility of taking the aggressive rests with us, which is contrary to the views we have entertained from the outset. Would it not be the wisest measure for us, therefore, to let an Ambassador Extraordinary precede any armed force? Should the Koreans offer us violence—as they are sure to do-that is certa nly a reasonable pretext for war. . . . I repeat that it will be far better for us that the sending of an envoy should precede any other action, and inasmuch as the Koreans will be sure to put him to a violent death, I ardently request you to use your best influence to obtain the appointment for me. Although I cannot prove myself to be as efficient an ambassador as Mr. Soyejima, yet I think I may be able to accomplish the easy task of sacrificing my life. Setting aside all ceremony, I beg you to do all you can for me.

With profound respect, SAIGO.¹

If there be a viceroy, a governor, or a mandarin in all China who is capable of writing such a letter as this and of sacrificing himself for his country in the manner proposed by Saigo, he has not yet come to the front. Japan, at the beginning of her wonderful era of transformation, had scores of such men—if not hundreds--and to them she is mainly indebted for her present greatness. China may yet bring forth such characters, but she has produced none thus far, and to the lack of them her present condition is largely due. As the Secretary of one of the foreign legations said to me in Peking, "What the Chinese need is not a change in their governmental institutions, but a change in their moral character."

4. One of the worst of the evils from which China now suffers is the lack of uniformity in her standards of value. Her finances are in an absolutely chaotic condition, on account of the instability of her currency and the constantly changing ratio between one kind of money and another. The coin in common use among the people is the copper cash, but the standard of value in all large mercantile transactions, as well as in the Government service, is the silver ounce. or tael. If there were only one tael, and if that tael bore some fixed and definite relation to the copper cash, the state of things would be no worse than it is in silver-standard countries generally; but there are more than seventy local varieties of tael, each differing slightly from every other; and the values of these taels, expressed in terms of cash, vary not only from day to day in time, but from district to district in space. In one village the tael exchanges for a thousand-cash string and a half, while in another village eight hundred cash make,

Private letters from Saigo to Count Itagaki, made public by the latter in February, 1906. (G. K.)

nominally, a thousand-cash string, and a tael can be had for a string and a quar-But the tael is not the only silver coin in circulation. The Chinese make or import four or five different silver dollars, and each of these has an uncertain value, in taels or cash, which also fluctuates widely in accordance with varying conditions of time and space. There is no uniformity even among the cash. A ten-cash piece issued by one provincial mint is not equal in value to a piece of like denomination issued by another mint, and neither of them will buy ten one-cash pieces separately. Ningpo, for example, a local ten-cash coin exchanges for nine separate onecash pieces, while in Tsingkiangpu a ten-cash coin will buy only seven separate cash. Then there are the paper notes of private Chinese banks and private foreign banks, which add still another complication because they are discounted at rates which vary directly with the distance from the place of issue. A Tientsin bank note may pass at par in Peking, but it will be taken only at a discount of five per cent. in Shanghai, and perhaps ten per cent. in Canton or Hankow. The same railroad company will sometimes accept a bank note at par in one of its ticket offices and cut it five per cent. in another. In my own experience, bills of the Russo-Chinese Bank were taken at par by the railroad ticket agent at Peking, while they were refused altogether by the ticket agent of the same railroad at Paotingfu, only a hundred miles away.

If a man should make a long journey through the Chinese Empire and come back with his pockets full of taels, dollars, bank notes, and copper cash, received at different times and in different places as change, it would take him at least a whole day to figure out what he had left and reduce it to the gold standard; and as for making an itemized expense account of his trip, it would be absolutely impossible. An expert Chinese mathematician, with an abacus and a whole sheaf of exchange quotations, couldn't do it in less than a week!

It is hardly necessary to say that this chaotic monetary system hampers trade, facilitates "squeezing," gives uncertainty

to all financial transactions, and gradually impoverishes the peasants, who have neither knowledge enough nor capital enough to take advantage of favorable fluctuations in the money market. They are completely at the mercy of people who know more, or have more, and their taxes and living expenses may be doubled in a single year by the operations of one provincial mint which is being run by the viceroy "for what there is in it."

5. A fifth reason for the weakness of China is lack of fighting ability. Although we in the West have a Hague Tribunal and innumerable peace associations, and although our civilization is nominally Christian, we do not hesitate, in the furtherance of our commercial interests, to push to the wall any nation which happens to be too weak to resist. The Chinese have never been a fighting race, and have never tried to cultivate the combative spirit; and their lack of defensive power has compelled them to submit to countless indignities and humiliations, and in less than a century has cost them Hongkong, Macao, Saigon, Vladivostok, Weihaiwei, Kiaochow, a large part of the Liaotung peninsula, and the whole of Korea. These calamitous results of military weakness have been due not so much to pusillanimity on the part of Chinese soldiers and sailors as to the general attitude taken by the ruling class toward the army and navy, and the treatment of army and navy officers by the civilian branch of the Government. The military profession in China has hardly been regarded as respectable, and military officers have always taken rank far below employees of the civil service, both in the provinces and in the departments. Up to last year a civil service official of the fifth grade might have an army officer of the same grade flogged publicly with a bamboo rod, and a viceroy might order the flogging even of a general or an admiral. Civil service employees could not be subjected to corporal punishment until after they had been reported to the throne and cashiered; but an army or navy officer, unless he held civil as well as military rank, might be whipped and disgraced by almost anybody. No selfrespecting Chinese, of course, would go

into a profession where he was sure to be regarded with more or less contempt, and where he might be subjected to such humiliating treatment. This reason alone would be enough to account for the weakness of the Chinese army; but to this cause must be added absolute ignorance of modern military science, an inadequate supply of modern weapons, complete lack of uniformity in organization, drill, and equipment, and a complicated system of fraud and theft in the military service, which, as Mr. Holcombe says, "almost surpasses belief."

After the battle of Pingyang in the Chinese Japanese war, a number of wounded Chinese soldiers were taken to a Japanese hospital, where one of them was questioned by a foreigner as follows:

"How does it happen that the sons of the gods are wounded in their afterparts only? It looks as though they had run away from the barbarians."

"We advanced all right," replied the Chinaman, "and according to military rules. Then we put on fierce faces, like Che-Kal-Yang the God of War, certain that the Wojen" (dwarfs) "would run—as they should have done if they had not been hopeless savages and unac-

quainted with Chinese characters. We rushed on them breathing fire, but they moved not. Then our general shouted 'Victory!' for we had paralyzed them with our boldness. But suddenly a long row of guns raised like an arm, and, immortal gods! such a dastardly way to fight I never saw! I know not why we were wounded in the back."

Even after their defeat by Japan the Chinese took no effective steps to reform or improve their military service. When Marquis Ito visited China nine years ago, he strongly advised the high Chinese officials whom he met to establish a military academy in every province for the training of officers, and to put all these schools under the direction and control of foreign instructors. "With well-trained officers," he said, "you can create a modern army; but without them it is impossible." The Chinese listened courteously to this advice, but took no action; and now, when Germany bullies them, Great Britain domineers over them, America sells them out to Belgium, and foreigners of all nationalities invade their territory for the purpose of exploiting their resources, their only weapon of self-defense is a mob of frenzied rioters.

JOHN BURNS, LABOR MINISTER

BY ENOCH KNIGHT

NO years ago, after a study at first hand of several figures in British politics, I wrote of John Burns: "He is, to my mind, better worth knowing than any other man in England." I had watched him with an interest amounting to astonishment during the bitter aftermath of the Boer War, when Chamberlain was breaking away from old ties, when the Nonconformists were holding their meetings everywhere, in the churches, in the street, and by the hundreds of thousands in Hyde Park, and when the licensing question was also nearing its crisis and was about to become another portent of the great political storm that was sweeping over England in the early summer of 1903.

I had supposed Burns to be a man of large build, rough and uncouth if not brutal in manner, as well as unlettered. Nothing could be further from the facts. Small, of gentle mien, simple as to dress, alert to catch every breath of knowledge from the world about him, and devoting his days and nights to study, this man, gray at forty-five, appealed to me as did no other man upon the crowded floor of the Commons.

Soon after making a slight acquaintance, he invited me to spend a day at his house in Battersea, across the river from Chelsea, where he had lived as a boy with a mother who could barely keep the two alive, and who felt herself rich when at last the boy found work

^{*} Korean Sketches," by the Rev. James S. Gale.

that paid the munificent wage of three shillings a week.

It is an old story how he persevered until he learned the trade of a machinist, with a journeyman's pay, and how at length he made a home in the neighborhood, and how he became a member of the London Council, and almost at once a member of Parliament, and how he has continuously held both these offices unchallenged and unquestioned by his supporters for going on fifteen years. And when I sat for a day in his workroom, which is the whole second floor of his narrow little house, and saw the books and pamphlets relating to every phase of social and economic questions, and how, as if by instinct, he could turn to chapter and verse to prove his word, I felt more than ever that he is best worth knowing of the public men of England, if one would go to the bottom of her vital interests.

One feels that the foundations of this man's life were sure. As if he realized that he was to meet hardships and danger, he early began to inure himself to bear them. With a boy's worship of the hero of his choice, young Burns studied and followed the rigorous training of Charles XII. of Sweden to endure cold and fatigue, and never was a more devout disciple. He never wasted, but conserved, every atom of his native strength. Avoiding all forms of dissipation, he preached, and still preaches everywhere, against the crime and waste of drink. While claiming that British workingmen are improving their estate, he pointed me to statistics showing the misery still existing in "the little boxes with slate lids," as he calls the tiny houses of even the better class of laborers, with families struggling to maintain life on "a fluctuating pound a week," as he put it. Burns's appeals are made for total abstinence, "but this must be supplemented by local or legislative action." His knowledge of the condition of the poor is simply marvelous. Even as I write, an election paragraph tells how he met Mr. Chamberlain's reckless assertion that a million workmen are inmates of charity institutions, etc., by proving from the records that there are just 213,000, and that many of these are temporary patients in the hospitals. This is set down simply to show his equipment for any discussion of the labor question.

And right here, too, is another notable thing. John Burns, while he champions the "laborite" movement, is exacting in his demands for obedience to the laws. Though twice arrested, and once held, as a disturber of the peace, many of the best men in London came forward to urge and to prove that personally he sought peace, and should not be held for violence that he could not avert.

How he was really regarded by Scotland Yard in the great dock strike is best shown by Burns's own account of that episode. Seven thousand starving men, on their march to Trafalgar Square, were stopped at the river by the Chief of Police, who barred their way. much parleying, Burns was sent for. He had always urged that workingmen had as much right as any other bodies of men to march in London streets, and that any violence must be deemed an incident and not a purpose. occasion, though not the promoter of the demonstration, every one turned to him for counsel.

"I went," said he, "to the Chief of Police, and asked that the men be allowed to march into the city. He refused. I asked him on what ground. He said there might be violence. I told him the men were there, and had a right to march, and violence would more likely come of refusal than of consent. don't know these men,' said the Chief, 'but I know you; and if you will put yourself in command of them, I will consent, for I can trust you.' I asked time to confer with the men, and passed down the line telling them how useless it would be to attempt to oppose the Chief, who could assemble a force of fifteen thousand policemen in an hour, but told them I would lead them if they would keep faith. So, putting myself at their head, we marched to Trafalgar Square, where scores of the weaker ones fainted from fatigue and hunger. Not a few of that great throng had been without food a day or more. One poor fellow begged the remaining portion of an apple which a bystander was eating, and afterwards

said this was all he had eaten for more than twenty-four hours."

The above is the substance of Burns's account of the greatest and the last demonstration in the famous dockyard strike. It made a tremendous impression upon London, even accustomed as the great city is to the sight of hungry Signs of sympathy soon appeared everywhere, with offers of help, and Burns was the hero now, upon the very spot where he had been twice arrested for espousing the workingman's cause. A saloon-keeper offered him a hundred pounds for the straw hat he wore that day, but Burns's only answer was his offer to give it to him if he would stop selling whisky. The old hat, costing a shilling at its best, along with the bludgeon with which he defended himself and wife and child from the mob angered by a speech against the Boer War, is a cherished souvenir of those rough years. The windows were broken in his little house on Lavender Hill, and for two nights he stood in the narrow doorway and faced that most unreasoning of all human gatherings, a London mob. That in two years he was stronger than ever with his constituents is only to recognize another by-product of mob spleen. How courageous was the stand Burns took against the whole South African policy is known of all men; and the "Orientalized Imperialism," whose advocates he challenged at every turn long ago, has lost both charm and character with a great body of the British common people.

The career of this man demands more than a brief moment's curious interest. It is worth study, and it will be a great pity if the labored efforts of certain London journals to discredit him as the new head of the Local Government No other man in Boards succeed. England knows the case of the people as well as he, and not another heart has been so often melted at sight of "that numberless, starving army at all the gates of life" that swarms in the great capital. Every case, and every table, and every inch of wall space in John Burns's little two-room workshop is burdened with books relating to the problems of human life—the life of the masses

who bear the heat and the burden of the Any one of these books is at his fingers' ends when wanted, and its facts are on his tongue's end when called for. Mr. Blaine once said to me, "I thank the Lord that the things which I happen to know, I know anywhere, any minute," which was the grand secret of his marvelous skill in controversy. I felt this to be equally true of Burns. His mind is not an attic littered with odds and ends, useful mainly for rainy-day reverie and reminiscence, but a well-ordered storehouse filled with seasoned dimension stuff, fit and ready for instant construction.

Nor is there a sign of demagogy about the man; and one feels assured that an honest as well as a mighty purpose is behind this equipment. He never caters to the passion or the prejudice of the moment to win favors or votes. When he speaks, he speaks the policy and doctrine of his life-work. He bids the workingmen remember that reform must begin with themselves, and that "the drinker and the skulker have no place in saving them from the condition

"Where home is a hovel and dull we grovel, forgetting the world is fair."

He says he has little faith in "the pauperizing palliatives" which the superficial slum worker relies on. Here is a sentence from a recent address of this preacher of righteousness:

The curse of the working class is the fewness of their wants, the poverty of their ambitions, overloading of a few sensuous tastes, and the absence of a varied set of elevated and healthy desires.

But John Burns is more than a worker in this special field. He is proud of England, as well as of his beloved London—of which he declares it is on the whole the best-governed great city in the world—and his grasp of general affairs is firm and sure. When the criticism of the personnel of the army was at its height in 1904, he spent a week with the men in camp, and bivouac, and on long forced marches to determine for himself the question of their endurance. It was done without a flourish or newspaper mention, and just as is the manner of this man of iron frame and purpose.

I am not a hero-worshiper, nor would

I attempt to make fine comparisons here. But I have spent much time in trying to get at the meaning of British politics these late troubled times, and I feel sure that John Burns has made himself a force whose influence is not even vet fully measured. It is not that he has risen from obscurity and been a leader these many years in Parliament, and the best-known home and world worker in behalf of the poor; but he has never essayed a gait that for a moment has carried him off his feet. He settled the dock strike because he saw deeper than his fellow-men. A gang of bosses had got control of the stevedore business, and had forced men to do this fastest and hardest work in all the world at starvation wages. The judgment and conscience of merchants and ship-owners had been stifled or overridden by the cruel taskmasters who were in control of the business. Burns appealed to this judgment and conscience, and he showed London these victims of wrong, many of whom went daily to their slavish task half famished. The case needed this object-lesson, and very soon a settlement was made upon a new bond of faith, which has never been broken; nor has the peace ever been broken by the thousands whose pitiful plight shocked even the dulled sense of a British public. Who else in all England has done such a work as this?

And yet it is only one example of his devoutness and sagacity. It will be remembered that Burns has been in the United States several times, but it was made plain to me that he was not an advocate of the methods of labor reform

he found, and he plainly indicated a fear that the worst of our social troubles are yet to come. And I have to confess that, though I am not a stranger to social and economic study, he put me to shame at some points of our several talks by the keenness of his insight into our condition and the absolute accuracy of his knowledge of our case. all was I impressed with his impatience with those who rely on party aid and political promises. I observe that his recent election address was condemned by some London journals for its criticism of government. This was not his manner in the interviews accorded to me. All extreme views of Socialism were sharply deprecated, and his distrust of all sorts of propagandists was openly expressed. But John Burns as a prophet is as interesting as John Burns as a worker. I asked him, at our first meeting, what Mr. Chamberlain's prospects were. He went on to express his belief that Mr. Chamberlain was too "smart" to be trusted by the people, and that he broke faith even with his fellows of the Cabinet by keeping from them the secret of his proposed resignation and springing it as a sensation by a stump speech at Birmingham. will be snowed under," were his words in the summer of 1904. Reminded of this prediction towards the last of the Balfour Ministry, he said, "And I want to tell you now that 'Joe' will not only be snowed under, as I predicted before, but he is a spent force in British politics." Whether this latter prediction is likely to prove true or not is another story.

WORK-DAY PRAYERS

BY CHARLOTTE PORTER

God of Love, God of Work! Touch me with fire! For the dross within me, fill me with ire!—
So with pure passion I cleave to my Star,
Speed my work, daily, toward the mark—far!

God of Love, God of Work! Breathe in me—air! Blue and breeze-swept spaces brighten my care!—So each swirl of effort leave my hand calm, So each heart meeting mine only feel—balm!

ENGLAND'S STRIDE TOWARDS DEMOCRACY

BY SYDNEY BROOKS

COUNTRY may be democratic in form without being democratic in fact. England has always more or less been such a country. That is to say, its political institutions and the logic of its political arrangements have always been somewhat in advance of its social instincts. In the United States it is just the other way about. America is far more of a democracy socially than politically. In Great Britain, on the other hand, we have the curious anomaly of a nation essentially aristocratic in its composition and penetrated with the spirit of caste, yet governing itself in accordance with the prescriptions of an extreme Radicalism—a Radicalism which Americans, who are the only genuine Tories left to the world of modern politics, would decisively reject. At bottom, therefore, England and the United States are approaching an almost identical problem from different standpoints. Both countries, as I see the matter, are engaged in an effort to bring their social and political theories into harmony, the difference being that in England the leeway which we have to make up is mainly social, while in America it is mainly political. It is from this point of view that the presence in the British House of Commons of fifty-odd Labor members seems to me to derive its chief significance. In other words. I reckon their advent as of really greater moment and as carrying with it wider implications in its social than in its political possibilities. Not that the latter are by any means small or negligible. They raise, on the contrary, a whole host of fascinating speculations. Any one who thinks himself somewhat of a political prophet may find in them material enough for all his ingenuity to work upon. In these fifty Labor members we have unquestionably a new and distinct party. Thirty of them are definitely pledged to act independently of

both the historic parties, and it is only a question of time before the remaining twenty (who at present regard themselves more as a wing of the Liberal party than as a distinct Labor group) join forces with their more resolute brethren. What is likely to be the effect on the party system, as a whole, of the rise of this powerful, able, and disciplined group, holding itself aloof, except for purposes of temporary co-operation, from Liberals and Conservatives alike, and playing the familiar Nationalist game of complete independence tempered by occasional and purely tactical alliances? Does it mean that our politics in England are slipping down the Continental incline? Will the British Cabinets of the future be like the Italian and to some extent the French Cabinets of to-day—less a homogeneous entity than a mosaic of sections, interests, and factions with representatives from nearly every quarter of the Chamber? What, again, is likely to be the influence of Labor on Liberalism? Is England about to witness the beginnings of that movement which on the Continent of Europe has nearly everywhere superseded the old school of Liberalism by a new and militant Socialism, and shows signs of splitting up country after country into a party of the Haves and a party of the Have Nots? Or will Liberalism once more display what we fondly think to be the supreme genius of the English people for politics by altering its focus in time and by taking the lead instead of being dragged in the wake of the novel and incalculable forces that have burst into political life? And, apart from these remoter speculations, there is the significance of the new Labor party in relation to the problems of the immediate present to be considered—its influence. for example, upon trade unionism, upon the House of Lords question, upon the personnel and procedure of the House

Digitized by Google

of Commons, upon education, upon the conditions of public employment and public contracts, upon the aims and spirit of municipal socialism, upon the legal responsibilities of strikes, upon the unemployed problem, and upon the attitude of the working classes towards the army, the navy, and the Empire.

These are all questions of indisputable moment, and with some obvious claims to consideration. Nevertheless, as I began by saying, the social aspects of the new Labor party seem to me to have an importance equal to, if not greater than, its political aspects. I am disposed to see in it the first signs that England is at last and really becoming democratic. One of the mitigations of the British system hitherto has been the prejudice of the working classes in favor of Parliamentary representatives who are "gentlemen." That prejudice hardly explains why the middle and upper classes have not been swamped by the vote of the working classes; why the dominant ideals of the country have been those of the wealthy and cautious bourgeoisie; why social reform has somewhat lagged; and why, except in insignificant numbers, Labor has returned to Parliament no members of its own, and has shown until now next to no consciousness that seven-tenths of the voting strength of the country lay in its hands. Nearly all the reasons for these developments—not one of which was anticipated by either the opponents or the advocates of universal suffrage-may be summed up in the paradox that we in England are a democracy but not a democratic nation. We are a democracy presided over by a monarchy and ruled by an oligarchy. The House of Lords is patently and deliberately oligarchical. The six hundred and seventy members of the House of Commons are mostly rich men. has often been said that there is no place where a poor man feels so out of it as in the House of Commons. I doubt whether any legislature in the world can show so large a proportion of wealthy members as the British Parliament. a nation we are suspicious of the poor man in politics. That is undoubtedly one of the reasons why the Irish demand for Home Rule has not yet found favor

with the English electorate. The sort of candidate that the average Englishman of whatever grade in society likes to vote for must first of all, as I said, be a "gentleman." That is to say, if he has money and is ready to spend it; if he has position, social or commercial; if he has received the imprimatur of one of the great schools like Eton or Rugby and of Oxford or Cambridge; if he is known as a generous employer of labor, or as the relative of a Peer, or as an energetic sportsman—then there is no constituency in the land that will not be glad to get him as its representative.

The ordinary American has a good many political convictions. The one that most pleases me is that his next-door neighbor is only a little less qualified than himself to govern the nation. pleases me from its very oppositeness to our English theories. The candidate that most appeals to the English "man in the street" is a member not of his own but of a higher social class. duroy is attracted by tweed, tweed by broadcloth, and broadcloth by ermine. One result of this is that it is practically only the men of means and established position, the men of birth and the men of leisure, who get into Parliament. And getting into Parliament is an easy task compared with getting into the Cabinet. It is an all but invariable rule that a Minister should belong to the "governing class "—that is to say, that he should be a member of the Peerage and its offshoots among the great landowners and county gentlemen, or else one of the comparatively limited number of wealthy persons of mercantile, manufacturing, and professional activities who are admitted into society. It is very little of an exaggeration to say that the governing center of the British Empire is the West End of London. To reach Cabinet rank in England you must have been accepted and indorsed by Mayfair. There are, of course, exceptions to this Outsiders of superlative proficiency in the arts of political success, like Disraeli and Mr. Chamberlain, have occasionally forced themselves, in spite of the bitterest opposition, upon both society and the Cabinet. But it remains the fact that you will scarcely ever find in England a poor man in a high political position without influential connections and first-rate social backing. I doubt whether it would be possible to give a single instance of an English Premier who had not passed most of his life in the innermost recesses of London society, who was not closely connected by ties of marriage or birth or of long and intimate association with the most exclusive sets in the capital, and who did not instinctively turn to men of his own social standing in forming a Cabi-That has always been our English way of doing things, and it is not by any means a bad one. It puts men of good breeding, upright character, fair capacity, and a certain impressive stateliness in charge of affairs; it provides a class that is pretty well equipped for public business; and while it encourages favoritism, it discourages corruption. But it is essentially oligarchical. It takes a good deal of the seriousness out of public life; it reduces politics to an "affair of friends;" and it makes administration and legislation appear a game for wealthy amateurs and a field for the display of the smaller social arts. There are always four or five men in every British Cabinet for whose presence there is not the smallest justification except that they were born in the purple or near it, have always looked upon office as a birthright, and simply decline to be got rid of.

This sort of thing, and all that it stands for, would be impossible in a country that was really democratic in spirit and that had not confused its "values" and strayed from the pathway of reality. An American visiting England is at once made conscious of the profound atmospheric differences that distinguish the two peoples. He finds himself in a land saturated with flunkeyism, a land where the dignity of life is lower than in his own, a land where a man born in ordinary circumstances expects and is expected to die in ordinary circumstances, where life is one long battering at locked doors and floundering in blind alleys, where the scope of the individual's efforts is too largely traced beforehand by the accident of social position, where a man is handi-

capped in all cases and crushed in most by the superincumbent weight of caste privileges, "good form," and the deadening artificialities of an old society. is not the English way for a man himself to make his own career and to be judged and rewarded simply and solely for what he is and for what he does. There, unhappily, the conventions stifle, false standards are in the ascendant, and the worship of externals and appearances has grown to be a national disease. That is why a great many Englishmen hail the new Labor party, apart altogether from its political programme, as an inspiring omen. They see in its emergence the beginnings of a true social regeneration that will be independent of the legislation which it may or may not advocate.

If I have made my point clear, it will be seen to be little less than revolutionary that some hundreds of thousands of English workingmen should have broken away from the domination of caste and adventitious influences and should have voted squarely for representatives of their own social level. Of course they have done so in a class spirit and for class ends. That was only to be expected. Still, it remains true that for English workingmen to support their social equals instead of meekly accepting their social superiors is a sign in them of a new moral health. It implies an alteration of standards that can scarcely, for the good of England, be carried too far. It means that their attention is becoming concentrated more on the things that really matter in life and less on what Burke called its "solemn plausibilities." And the men they have sent to represent them in Parliament are men not merely of their own social class but of their own stamp of character. They are direct, hard-headed men of affairs, unfettered by tradition and equally dissatisfied with both the historic parties and with the antiquated procedure of the Assembly in which they intend to make themselves felt. They go to the legislature with what is almost a new conception in English politics—they go to legislate. They do not go to make speeches for the pleasure of making speeches, or to advance purely personal or professional interests, or to use Parliament as a social ladder. They go to do things; and the House of Commons at present is inclined to be a conspiracy for doing nothing. I do not really very much care what measures they propose so long as they import into the artificial atmosphere of our English politics, as I believe they will, a new earnestness, a new reality, and a new efficiency. I look to them to test the worth of men and things by standards that may, and no doubt will, offend many conventions, but that will also receive the approval of all who hate

cant and shams. I look to them to restore those juster proportions that the conditions of English life and politics have tended to distort. I look to them, in short, to initiate an influence and an example that will grow at once more intensive and more extensive, that will prove the most powerful of all forces in the remaking of England, and that will eventually help the people to become as democratic in their daily life and social instincts as they long have been in their political forms and institutions.

SCHUMANN AND THE ROMANTIC MOVEMENT

BY DANIEL GREGORY MASON

HE story of the life and work of Schumann forms one of the most enlightening documents in the history of romanticism in music. Were there no other romantic composers, we could almost construct the type from this one individual. His youth reveals clearly all the traits of the born romanticist: the delight in a richly sensuous tonal basis, the interest in specialized expression and in allusions to extramusical ideas and objects, the free rein for fancy, the capricious subjectivity, the attitude of lordly indifference to tradition; and his later years show no less clearly the tendency of the sincere romanticist to subject himself to discipline in the interests of a broader and more universal ideal. He who would understand romanticism, both its glories and its shortcomings, should give his days and nights to Schumann.

In Schumann's life a happy, careless, rather unregulated boyhood, divided between dreamy introspection and high animal spirits, led naturally into a youth of eager enthusiasms and earnest but intermittent study. There was much desultory reading and piano-playing, initiation into the congenial atmosphere of such romantic authors as Hoffmann, Byron, Heine, and Jean Paul Richter, clever but impatient dalliance with poetic and musical composition. The earliest

piano pieces, characteristically, were fanciful sketches of personal friends. Then came the death of Schumann's father, and the decision of the young poet's guardian that he should study But by 1830 Schumann had got his own way, and started off to Leipsic to become a concert pianist. A year later he managed to cripple his right hand irremediably by a mechanical device which his impatience suggested as a short cut to virtuosity. His attention was thus forcibly concentrated on composing, and during the decade of 1830-1840 he produced an extraordinary series of pianoforte works.

The first thing one notes about these early pieces is the liveliness of their author's fancy, his tendency to connect all his musical impressions with thoughts and interests of an extra-musical char-His Opus 1, for instance, consists of Variations on a theme the notes of which spell in musical letters the name Abegg (A-B-E-G-G), a pseudonym given by Schumann to a lady whose beauty he had admired. This entirely factitious and rather childish mode of referring from musical to extra-musical experiences seems to have had a special charm for Schumann. He wrote in the album of Gade, the Danish composer, a theme spelling "Gade, ade" ("Gade, farewell"); his opus 72 consists of six

organ fugues on the name B-A-C-H; and the Carnival is founded on a theme spelling A-S-C-H, in honor of a lady who lived in a town of that name.

The fanciful machinery is even more elaborate in the Davidbündlertänze, op. 6. Conceiving it as a part of his artistic duty to oppose the philistinism which pervaded music, Schumann dramatized the conflict as a struggle between the Davidsbund, or club of Davidites, and the forces of Philistia. His fancy played about this central conception until it had evolved a whole company of Davidites, individualizing each one. Several were merely single aspects of their creator's complex temperament. Florestan was the impassioned Schumann, Eusebius the dreamy and tender Schumann, Raro the philosophical mediator between the two. Others indicated friends, as Felix Meritis, Mendelssohn; and Chiarina, Clara Wieck, who afterwards became Schumann's wife. fictitious characters were constantly used for literary purposes by Schumann in the musical journal which he edited, the "New Journal of Music;" but what specially interests us here is their use in the Davidsbündlertänze. Each dance is signed by an initial, F. or E., signifying Florestan or Eusebius. There are even "stage directions," as, at one place, " Florestan stops, his lips trembling painfully." There are two mottoes, one an old proverb and one a musical motto of Clara Wieck, with which the composition begins; and the whole ends with a "March of the Davidites against the Philistines," in which the latter are symbolized by the old German Grossvatertanz. The same tendency to look through music to something else is shown in other works, such as the Kreisleriana, which is descriptive of a character in one of Hoffmann's tales, the Phantasiestücke, which have such highly fanciful titles as "Soaring," "Whims," and "Why," and the Faschingsschwank, in which is hidden a political joke.

All these tricks and whimsies are significant because of the light they throw on the romantic nature of Schumann's youthful interest in music. He is at this period inveterately subjective, personal, and allusive. What he aims at is by no means an objective, impersonal beauty, such as the Greek tradition stands for in art, but rather the charming presentment of very intimate, individual feelings and sentiments. Self-revelation is the ideal; and the works it produces are necessarily rather illustrations than monuments. possessing more interest and discursive suggestion than abstract beauty. this is not only in keeping with the romantic spirit, but a natural result of Schumann's previous musical training. He lacked the discipline, and the competent technique which discipline gives, that are requisite to the production of perfect and serene works. His youthful activities had been too miscellaneous and unorganized for the attainment of high musicianship. What he gained in versatility he lost in concentration.

There is, accordingly, a lack of sustained musical power in all this group of his compositions. The curve of his melodic flight is short and constantly renewed. There are few long, deliberate climaxes; a lack of restraint and reserve power makes itself felt. Even the sonatas, op. 11 and 22, are rather bundles of lyrical pieces, embedded as it were in a matrix of improvisation, than large coherent structures. On the other hand, all the fascinating and magical beauties of romanticism are here in generous meas-The richness and the variety of the sensuous effects are amazing. mony is massive, solid, and fresh. rhythms are nervous and vigorous. The melodic phrases are short but seizing, fragments of delicious tunefulness that, once heard, cannot be forgotten. invention is as unflagging as it is wayward, and the decoration is of an Oriental luxuriance. In a word, if there is something left to be desired in scope and control of imagination, there is such ceaseless play of fancy that our bewitched ears hardly have an opportunity to discover what they miss.

At about his thirtieth year, however, Schumann's artistic ideal underwent a gradual but radical transformation. We see him in the compositions of this time paying less and less attention to those

In German there are more musical letters than in English. H is B-natural (B being B-flat), S is E-flat, etc. Several composers have written fugues on the name of Bach.

purely personal whims and fancies that had at first dominated his imagination, and beginning to work very earnestly toward objective beauty and impersonal expression. The fictitious characters, the mottoes, the stage directions, the whole elaborate machinery of allusion to extra-musical interests, are forgotten, and the interest of the music itself becomes all in all. There had been already. among the works of his "storm and stress period," single compositions in which the dramatic interest was wholly subordinated to the musical, as, for example, the great Toccata, opus 7, the Allegro, opus 8, and the Novelettes, opus 21; but now what had been only occasional in the days when fancy and a self-involved emotional life absorbed him grew to be normal and constant, and he became for the first time a liberal and devoted artist.

Of the causes underlying this important change, the most fundamental was doubtless simply increasing maturity. Youth is naturally and innocently egotistical; the young man of sensibility loses himself in day-dreams and whimsical fancies, which have no basis in experience, and no reference to anything beyond themselves; age brings a sense of the values of real life, sobers and domesticates the passions, and enlarges the interests until they spread from the self to all humanity. In an artistic nature this general change of attitude involves a change of artistic ideal; poignancy, intensity of expression, become less valued than justice and proportion, the merely self-expressive comes to seem trivial, and whimsicalities are discarded as interfering with the serenity of a universal beauty. Schumann's change of attitude was simply an unusually striking case of what happens to every perceptive mind when experience has been sufficiently assimilated.

The story of Schumann's courtship of Clara Wieck has an important bearing on this question of the development of his character. It has been fully and vividly told by Mr. Richard Aldrich in a magazine article. Suffice it to say here that the marriage was stubbornly opposed for years by Clara Wieck's father, who

seems to have desired for himself all that Clara could earn as a virtuoso: that Schumann endured Wieck's unreasonable tyranny with wonderful patience, and tried all possible ways to win his consent; and that finally the lovers were obliged to take the matter to the courts. and were married against Wieck's will in 1840. It is not difficult to realize how the long devotion and unswerving loyalty, the doubt, anxiety, and suffering, and the final courageous exertion of will, involved in this courtship, must have matured the young musician who until then had been absorbed in musical dreaming and in random love affairs. When at last he was happily married, the romantic fickleness lay far behind him, and it was with clear and far-seeing eyes from that time forth that he looked upon life and music.

Another influence to the same end was the purely musical influence of Bach. As early as 1829 Schumann made a thorough study of the "Well-Tempered Clavichord," and from that day Bach became for him a main source of inspiration. In 1832 he writes in a letter: "I have taken the fugues one by one, and dissected them down to their minutest parts. The advantage of this is great, and seems to have a strengthening effect on one's whole system; for Bach was a thorough man, there is nothing sickly or stunted about him, and his works seem written for eternity." By 1845 we find Schumann literally taking the contrapuntal forms of Bach as models for his own compositions; among his chief works of that year are the Studies for Pedal Piano, the six Organ Fugues on the letters B-A-C-H, and the four Fugues for Piano, op. 72. The importance of this enthusiasm can hardly be overestimated. Of all composers Bach is the most purely and deeply musical, the most thoroughly founded on natural tonal laws, the least infected with extraneous ideals and meretricious methods. His art is quite objective and universal; he makes no concession to vulgarity or to insensibility, and his taste is as pure as his skill is impeccable. That Schumann the artist was as powerfully influenced toward health and nobility by Bach as Schumann the man was influenced toward

^{1&}quot; Music," Vol. 18.

wide sympathy and generous ideals by an increasing experience of life, no one who studies his activity after 1840 can doubt.

His very method of working, after he married and settled down to regular conditions, is significant of the change of attitude we have been tracing. Scarcely any other composer has pursued his calling in so precise and orderly a way. One after another he took up the various media of composition, mastered each so far as he was able, and laid it aside to turn to the next. The year 1840 he gave up almost entirely to song-writing, as was natural to one who had at last found happiness after years of doubt, anxiety, and waiting. In 1841, turning to the largest forms, he wrote three symphonies, and began his single but incomparable piano concerto. In 1842, after shutting himself in his study with the quartets of Mozart and Beethoven, he came forth with the three Quartets, op. 41, the Piano Quintet, and the Piano Quartet. His first large choral work, "Paradise and the Peri," was written in 1843, and others succeeded it from time to time. It was in the midst of this systematic attack upon Parnassus that the first symptoms showed themselves of that terrible brain disease which overshadowed his later years, which marred many of the works of his last decade, and which finally killed him in 1856.

In the songs, chamber-music, and orchestral and choral compositions of the mature Schumann we find, in spite of the advance in scope and mastery they represent, essentially the same qualities that give so indefinable a charm to the youthful piano pieces. Romantic ardor, warmth, glowing enthusiasm—that is the constant character of Schumann's music. Delicate sentiment, insurgent passion, and the magical beauty that transfigures both, are found no less in the "Manfred" Overture, written in 1848, than in the "Papillons" of 1830. There is the same abounding nervous force and manly vigor. There is the same mysticism, introspection, tendency to become rapt in thoughtful meditation. There is the same richness, too, of sensuous effect—the full, sonorous harmonies, the organ chords, the shimmering veils of dissonance, the

sudden vistas of new tonality. But added to all these there is in many of the later pieces a new vigor, a fuller virility, an austerer and more solid beauty, due largely to the influence of Bach. literal imitations of Bach's manner, to be sure, are not wholly successful; the body is caught, but the spirit evaporates; and the unwonted restrictions of the style cause awkwardness and a repellent angularity. But in the more lyrical compositions the Bach influence is most happily efficacious. Free polyphony, the canon, the sequence, and the dissonance used as a harmonic rivet, give such piano pieces as the Etudes Symphoniques, and such larger compositions as the finale of the great Piano Quintet and the cathedral movement of the Rhenish Symphony, a strength, an emotional intensity, and an artistic dignity that pure romanticism never attains. The more we study Schumann's true masterpieces, the more we realize how worthy a student he was of the greatest of masters. It was with a legitimate pride that he said, "I daily confess to this high power, to purify and to strengthen myself through him."

On the other hand, it must be confessed that Schumann never fully mastered the lesson of Beethoven. The supreme artistic glory of the great symphonist is the result of a perfect flexibility in the phraseology, and of a complex but truly integral organization in the entire structure of an extended work. Schumann fell far short of him in both respects. The brief scope and lyrical character of his themes, and his tendency to become the slave of a rhythmical formula, too often led him to cut all his phrases on the same pattern, and to repeat a given rhythm as a wall-paper or a carpet repeats a given figure. An extreme case is the theme of his first published work, the Abegg Variations, which consists of a two-measure phrase reproduced sixteen times; Mr. Hadow points out that "in the opening movement of the quintet the first four bars contain two clauses, upon which are built the whole of the first subject and the transition; while the first two bars of the second subject contain the clause upon which the whole of the succeeding melody is constructed." And even in

the symphonies, where variety of phraseology is most to be desired, analysis will reveal, through long stretches, a break at the end of every eight measures. The weakness in respect of the larger elements of structure is equally noticeable. In many of his piano works, as, for example, the "Novelettes," the "Arabeske," the "Kreisleriana," he makes no attempt at sustained development, but adopts a mosaic type of form, in which the several parts make no pretense of interrelationship. The discursive habit of mind of which this type of form gives evidence was invincibly established by the time he turned to chamber and orchestral composition, and it made his larger works take the shape of bundles of detached pieces.

So much of adverse criticism must perhaps be conceded to the devil's advocate; but, after all, it leaves Schumann's real claim upon our interest unimpugned. He is, first and last, in symphony and quartet, as well as in song and piano piece, a romanticist. He wins us by the freshness and sincerity of his emotion, by the sensuous delight of his harmonies and rhythms, by the brief but perfect moments of beauty of which he holds the secret. The musical landscape he spreads before us is picturesque rather than sublime, but once we have felt the solicitation of its brooks and trees and meadows we shall often gladly forget for a while the wider sweep of mountain scenery in our eagerness to wander there.

THE STRUGGLE AGAINST SOCIAL DESPOTISM'

THEN some despot like the Sultan of Turkey gives an order which results in a massacre, we Americans are rightly horrified. When an autocrat like the sovereign of the Congo permits a system of commercial exploitation to sacrifice African lives to the spirit of gain, we Americans wisl. that we could do something to interfere. Our humane instincts are creditable; and they are naturally aroused when we can see in some such simple form the desire for power or wealth thus crushing any people. In the meantime, before our very eyes, there are whole classes of people in America who are as truly subject to the tyranny of death, disease, want, vice, and crime as any Armenian or Congo native to his master. It is true, our humane feelings are stirred for those whom we see suffering or destitute in our own land; the puny, sickly child we send to a hospital; the consumptive working-girl we sometimes send into the

country; the unruly boy we put into a truant school; the drunken man we try to reform; but for the wrongs which such as these suffer we have no one to blame. When we hear of an Armenian massacre, our first thought is not to establish hospitals for the wounded, but to demand that the massacre cease; yet when we learn that thousands of the children of the poor die from diseases which spare the children of the well-todo; that thousands of others live only to be crippled, defective, inefficient; that young women earning wages are left to struggle unprotected against the allied forces of hunger and vice, and appalling numbers of them are forced to succumb to the one or the other-we have no sultan or king whom we can call to account, we see no murderer with sword or gun whose hand we can stay, and we ignore the fact that the responsibility rests upon ourselves.

Three books have recently been published which tell part of the story which literally millions of people in this prosperous land are enacting in lives confronted with destitution and death. Happily, these three books, frank and serious as they are in stating the cruelty

¹ The Long Day. The Story of a New York Working Girl as Told by Herself. The Century Company, New York. \$1.20, net.

The Butter Cry of the Children. By John Spargo. The Macmillan Company, New York. \$1.50, net.

Some Ethical Gains Through Legislation. By Florence Kelley. The Macmillan Company, New York. \$1.25, net.

of conditions and in placing the blame for those conditions upon the social system under which we live, are alike in suggesting to the reader constructive measures. They are not by any means revolutionary tracts, or essays in complaint; they are rather the records of three people who have known intimately the life of those that bear the heaviest part of the burden of industry, who have told what they have seen, and who are concerned, not with relieving symptoms, but with curing evils.

"The Long Day" is a bit of autobiography. The unnamed writer tells what she has experienced as a workinggirl in the city of New York. Few novels have such sheer narrative interest as this book; fewer still combine with such interest so vivid portraiture. The book abounds, too, with descriptive writing of no mean order. It is full of sounds and sights, of moods and atmosphere, of real people and real experi-That it is imaginative cannot be denied; but it is far from being imagi-The author frankly says that she has manipulated her material; but she has molded it skillfully. No one who knows the life in the crowded city can escape the conviction that here that life is pictured from the workingwoman's point of view as it is. This, moreover, is not the story of an investigator; it is the story of a girl who heard ringing in her ears the refrain "Work or starve."

Not the least interesting and valuable portion of the book is the final chapter, in which she states her conclusions, first as to the cause of the wretchedness she saw and experienced, second, as to the The primary cause she gives remedy. is the fact that working-girls do not know how to work; that is, they do not understand, and have never had the chance to understand, "the general principles of intelligent labor." It is worthy of note that the author found in Booker T. Washington's "Up from Slavery" the book which explained to her "what was the real trouble with myself and all the rest of the struggling, ill-paid, wretched workingwomen with whom I had come in contact during my apprenticeship." It is an impressive fact that, in looking for a remedy, this working-girl, who apparently

saw only the worst side of institutional religion, concludes that "a live and progressive church—a church imbued with the Christian spirit in the broadest and most liberal interpretation of the term can do for us, and do it quickly and at once, more than all the college settlements and all the trades unions that can be organized within the next ten years could do." But it is to the Church as a solver of social difficulties and the proclaimer of a social gospel that she looks. Among immediate specific needs she gives an important place to self-supporting, well-conducted lodging-houses for workingwomen.

As "The Long Day" deals with the social problem as it affects women, so Mr. John Spargo's book deals with it as it affects the children. The volume is an attempt to discuss the statement made by Mr. Robert Hunter in his volume " Poverty " concerning underfed children in the cities. It is, however, much more than this. It is a picture of the terrible burden which the children of the poor bear at the behest of society. It is not necessary to enter into the detailed statements of the book. The destruction and distortion of child life through lack of nutriment is grievous beyond words. More conservative figures than Mr. Spargo's cannot erase the shameful fact that society permits scores of thousands of children to die, and thousands of scores of other children to be blighted for life, in order that rich men may be saved trouble in making money, that dividends may be possibly increased and taxes may be possibly reduced. The experience of Rochester, New York, in reducing the infant mortality for July and August by one-half through the single measure of improving the milk supply indicates how many children are sacrificed to social neglect. The inexcusable economic extravagance, to say nothing about the inhumanity, of child labor is also forcibly expressed. The whole problem, however, is stated when Mr. Spargo points out that the evil will be eradicated only when every child is given a chance to obtain a share of the inheritance of the ages, and is relieved of that curse of want which to-day condemns countless children of the poor from their birth.

Mr. Spargo believes that the complete remedy will come only with Socialism—that is, "the socialization of the means of life." Among remedies "involving no fundamental change in the social structure," however, Mr. Spargo suggests the prohibition of the employment of women for a certain period before and after childbirth, public instruction in duties of motherhood, municipal day nurseries, municipal control in detail of the milk supply, public provision of food and careful medical inspection for all school-children, and more rigorous child labor laws.

Of Mrs. Florence Kelley's volume entitled "Some Ethical Gains through Legislation" it may perhaps justly be said that among the three books here reviewed it is the most successful in making clear the principle upon which all rest-the principle of the solidarity of society. Ot the three it will probably best repay careful study. Although its title is constructive, it is very far from being an indiscriminate record of what is good in present social conditions. It is rather a brief critical examination of the halting progress that has been made by the United States toward greater social welfare. The first two chapters cover the same field as Mr. Spargo's book, but in a different way. Besides stating conditions, they tabulate the provisions of the laws of the States on the subject of child labor. Two chapters are devoted to "the right to leisure" that is, to restriction in hours of labor.

In a chapter on The Right of Women to the Ballot appears, in spite of its brevity, one of the broadest arguments for woman suffrage we have seen. The last two chapters deal with the protection of purchasers. Whether the reader agrees with Mrs. Kelley in all her statements or not-and there are several points at which others equally concerned for social progress would take issue with her—he will receive two impressions from this book: one is an increased sense of the responsibility which rests upon society for insuring to every member of it a fair chance, and, conversely, the responsibility upon every individual for doing his share of society's task; the other is an increased sense of the function of law, not to make men good, but to express the ethical convictions and fix the moral practices which society at any stage of its evolution reaches.

The reader of these three books will find in them, not only an explanation of what Dr. John Graham Brooks calls the "social unrest," but also an indication of the direction in which people who best know the conditions are looking for cure. In "The Long Day" he will find a dramatic portrayal of one aspect of those conditions; in "The Bitter Cry of the Children" he will find an appeal on behalf of the least of those who suffer; and in "Some Ethical Gains through Legislation" he will find a brief, terse, but readable review of recent progress toward better things.

Comment on Current Books

The collaborated his-The Biography of tory has passed the an English Prelate experimental stage, and now we are face to face with the collaborated biography. It is improbable, however, that the fortune of the latter will be that of the former. At any rate, as exemplified in the recently published life of Frederick Temple, Archbishop of Canterbury, the plan seems foredoomed to failure. This biography is the work of seven of the late Archbishop's friends, each of whom deals with a special phase of his career. Thus, the school-boy and the undergraduate are shown to us by Dr. Wilson, Canon of Worcester; the civil servant in the Education Office, by Dr. H. J.

Roby; the Head Master of Rugby, by Mr. F. E. Kitchener, himself a master at the famous school; the Bishop of Exeter, by Archdeacon Sandford, who perhaps more than any of the other writers reveals the man and his work; the Bishop of London, by Archdeacon Bevan; the Archbishop of Canterbury, by Bishop Browne and Archdeacon Spooner; and, finally, Archdeacon Sandford gives a supplementary account of the Archbishop's career and personality as exhibited through his letters. This method obviously has advantages, particularly in insuring a complete record and a survey from varying points of view. But the disadvantages are more numerous and more weighty. In the

present instance the record is far too full. Every writer appears to have endeavored to incorporate into his part all the facts and information available, important and unimportant; so that the sense of proportion is lost and no definite impression of the qualities and achievements of the Archbishop is left on the reader's mind. Indeed, the biography would have been richer in actuality and informativeness had it been compressed, as it easily might have been, into a single volume. More serious is the inability of the writers to secure that detachment of vision necessary to a correct estimate of their subject. Archbishop Temple's life was undoubtedly noble and inspiring; but to present it as they have presented it is to give rise to exaggerated ideas of his place in the public, if not the ecclesiastical, history of his times. In fine, what we have here is, at most, a copious but fragmentary collection of materials from which a close and neither prejudiced nor prepossessed student may some time derive the facts for an adequate and convincing biography of the late Primate of All England. (Memoirs of Archbishop Temple. By Seven Friends. Edited by E. G. Sandford, Archdeacon of Exeter. 2 vols. The Macmillan Company, New York. \$9 per set.)

A woman of experience and Childhood common sense talks with other parents about the best ways of training children in this excellent little book. Introduced by G. Stanley Hall, Mrs. Theodore W. Birney is sufficiently indorsed to insure readers, who will immediately agree with her wise suggestions. The emphasis she places upon the family as a closely bound community, whose interests are mutual, is very important, in these days of what might be termed tangential family life. It is to be hoped that her plea for a system of allowances for children in order to train them financially will be heeded. The truth of the Spanish proverb she quotes is evident in this relation: "You can plan your garment as often as you choose; you can cut it but once." (Childhood. By Mrs. Theodore W. Birney. The Frederick A. Stokes Company, New York. \$1.10, postpaid.)

The Conquest of Canada

An American "definitive" edition has now been published of Major William Wood's "The Fight for Canada," which was reviewed in some detail in our issue of September 10, 1904. Further comment is unnecessary, save to remark that Major Wood has carefully revised his work and has included several additional notes, not the least interesting of which touch on the dispute concerning the authenticity of the tradition of Wolfe and Gray's "Elegy." We would

remind our readers that this book provides not only the latest but the most authoritative account of the Quebec campaign, being based entirely on original sources, some of which have hitherto been inaccessible; and that in its pages justice is for the first time done to the part played by the naval forces in the struggle which terminated French influence in the New World. (The Fight for Canada. By William Wood. Little, Brown & Co., Boston. \$2.50, net.)

A few years ago we in-The Christ of America were charmed by English Poetry the lectures given by the Dean of Ely upon the noble Cathedral of St. Etheldreda, whose history and beauty he unfolded in a spirit of devout loyalty. In his Hulsean lectures, before the University of Cambridge, last year, Dean Stubbs displays the same mastery of his subject and the same power of illuminating discourse. Believing that Personality is the mightiest force in the world, and that Christ is the supreme Personality of all history, the lecturer shows plainly that this claim to supremacy throughout all human thought and action ought to affect the moral character no less than the mental attitude of every baptized disciple of Jesus. Accepting Shelley's dictum that poets are the most representative, most prophetic, most clear-sighted and deep-hearted men of their time, the four lectures are devoted to an analysis of four periods in English history, and four poets are chosen as representing the idea of the great Personality. They are called as witnesses to the Personality of Christ and to the spirit of his religion, and he is shown as the mighty figure in the way, before men "very man and very God." Cynewulf's poem, "The Christ," is analyzed as representative of the eighth and ninth centuries. William Langland, at the close of the fourteenth century, reflected his time in "Piers Plowman." Of course no question could arise but that Shakespeare in the sixteenth and Browning in the nineteenth century best convey to us the great influence of Christ as seen through the minds of the poets. It is a keen intellectual pleasure to read these scholarly and most graceful discourses, stimulating as they are to our own thought. An added luxury is to be enjoyed in the excellent form of the bookperfect print upon tough, light paper. (The Christ of English Poetry. By Charles William Stubbs, D.D. E. P. Dutton & Co., New York. \$2, net.)

Daniel and His Prophecies In these lectures, recently given at the summer school in connection with the Episcopal Church, Dr. C. H. H. Wright, a British

scholar of some distinction, in his argument for the traditional view of the book of Daniel, has the advantage both in learning and in temper of some whose writings we have lately noticed. He agrees with them, however, in stigmatizing the modern view as "rationalistic"—a term of orthodox reproach for the dissatisfaction of reason with reasons it deems inconclusive. The conclusiveness of Dr. Wright's reasons for the belief he defends is less evident to us than to him. Not finding it in the historical portion of Daniel, he finds it in the prophetical, though this, as he admits, has been made to serve a variety of interpretations. Accepting as historical the stories of the three who passed unhurt through the furnace, and of the angel who protected Daniel from the lions, Dr. Wright says that their credibility rests mainly on the credibility of the book itself, and this in turn "has to be proved from the truth of the prophecies." The interpretation of these, introduced by a new translation of the book, based on the Revised Version, occupies the major part of these lectures. What the Hebrew editors of the Old Testament thought of the book of Daniel appears from their placing it, not among the books of the prophets, as in our Bibles, but in a later collection along with Ruth, Esther, and Ecclesiastes. Even Dr. Wright admits that a variety of interpolations occur in the book, and that the closing prophecy " in its present form" cannot be proved to be earlier than B.C. 164. But in the first, or historical, part of the book we find the term "Chaldeans" used in the sense it carried at that late date—a guild of astrologers—whereas in Daniel's time, four centuries earlier, it denoted an imperial nation. What Christian interest is served by pertinaciously reproaching with "rationalism" those whom such evidences convince, and why this should be favorably regarded by "a number of the highest dignitaries of the Church of England," is as mysterious as the meaning of "the thousand three hundred and five and thirty days" of prophecy. (Daniel and His Prophecies. By Rev. Charles H. H. Wright, D.D. Little, Brown & Co., Boston. \$2.50, net.)

The Dynasts

The second part of this elaborate attempt by a novelist of very high rank to show with panoramic breadth, in the poetic spirit and in dramatic form, the scope and significance of the great Napoleonic struggle, and to bring into clear light the heroic part played by England in that struggle, deepens the impression of the bigness, so to speak, of the idea, the force of imagination behind it, and the entire inability of Mr. Hardy to do what he has attempted to do. No one but a man of genius could

evolve such a conception as that which underlies this great drama, and no one but a great poet could adequately realize that conception. Now, Mr. Hardy is a man of genius, who has written a few novels that have put him in the front rank of English novelists; but he is not a poet; and "The Dynasts," in spite of certain great qualities, is a lamentable failure because it is not poetry. There is an occasional lift of wing in a phrase, an occasional touch of poetry in a sentence; but, as a whole, it is like a great balloon which lies collapsed upon the ground. There have been many instances of the waste of time and strength in our time by men of great gifts who were attempting to do something for which neither their gifts nor their training fitted them; and among these attempts "The Dynasts" must surely find a first place. It is absolutely hopeless as a poem. (The Dynasts. By Thomas Hardy. The Macmillan Company, New York. \$1.50.)

A high ideal of Ethical Principles marriage is the of Marriage and Divorce starting-point of this monograph by Mr. Louis F. Post. "Each of the parties to a genuine marriage must be in love with the higher intellectual qualities and the deeper moral impulses of the other." It may occur to the reader that this is rather the ideal of marriage, and that genuine marriage short of this comparatively rare ideal may yet exist. Mr. Post, however, argues that without such unifying love marriage is essentially no better than concubinage. Genuine marriage is not created by the formal ceremony that is requisite to declare it; it exists before such declaration; it dies, if the love that constitutes it dies; it is reasonable and also conducive to moral interests that there should be a conventional release from the remaining conventional bond. But the rights of the persons immediately interested and the rights of society itself must be duly provided for. Mr. Post, therefore, insists on a "reasonably liberal" divorce law, though conceding to the churches full freedom to rule as they judge right in their separate sphere. Divorce having been formally declared, any legal prohibition of another marriage belongs, in his view, to "a system of meddling paternalism," and is both immoral and provocative of immorality. It should be said that the emphasis of Mr. Post's argument is rightly laid on the ideal conception with which it begins and ends. "Marriage love is not complete in any case until, aglow with mutual association and service, it radiates outward in democratic service to others." (Ethical Principles of Marriage and Divorce. By Louis F. Post. The Public Publishing Company, Chicago. \$1, net.)

Time has dealt hardly Spirit of His Dramas with Euripides, of Euripides and the dramas only seventeen have come down to us entire. Professor Decharme, of the Paris Faculty of Letters, believes that until a recent period modern critics, misled by Aristophanes, a personal enemy, have underrated him both as a man and a poet. In this work he would reveal to us the true Euripides. School-boys have long been taught that he stands among the Greek tragedians the third in rank, next to Æschylus and Sophocles. Modern poets from Dante to Browning have shown his effect upon them. "No other Greek poet except Homer," says Professor John Williams White, of Harvard, in his Introduction to the present translation by Mr. James Loeb, "has made so deep and lasting an impression on ancient and modern literature." Dr. White regards him as "an interesting example of an unusual type, an elderly man with an open mind." As an independent thinker and an innovator he did not escape in his time the fate of such. But as such he wrought effectively by his advanced views for the emancipation of thought among his countrymen. What these views were, as bearing upon religious traditions, philosophy, society, and politics, is the subject of Part I. of Professor Decharme's work. Part II. is devoted to a critical study of Euripides's dramatic art, with especial regard to points of controversy, and to new discoveries and criticism. Consequently the work appeals largely to critics of literary art. They will agree at least in this, that Euripides is the great leader of the realistic school, in all the heights and depths of which his genius moved and still moves upon men's hearts. (Euripides and the Spirit of his Dramas. By Paul Decharme. Translated by James Loeb, A.B. The Macmillan Company, New York. \$3.)

In this authorized translation Future Life of a noteworthy book by M. Louis Elbé, of Paris, ancient wisdom and modern science are summoned to testify, and are found to agree. Part I. records the beliefs and customs which among the most unlike peoples from primitive to modern times attest the general conviction of a subtle element in man which outlives his physical organism. Part II. finds that science, up to the limit of its competency to affirm, affirms the probability of that survival which faith, reaching further, asserts. The reader is introduced to the recent theories and experiments of French savants, especially mentionable among which are the researches of M. de Rochas, showing that sensitivity is "essentially distinct " from the physical body, and can be externalized from it. In this highly interesting section of the work the scientific conception of the immaterial ether figures largely. M. Elbé concludes that consciousness passes over into future life, but is there transformed, and that the moral attainments here made are conserved. It is rather curious to find this devout Roman Catholic, who believes that an agreement between science and religion will be effected by an infallible decision of the Pope, committing himself to the materialistic doctrine that all our choices are necessitated to be what they are, and that consciousness is illusory in affirming that any liberty of choice exists. (Future Life. By Louis Elbé. A. C. McClurg & Co., Chicago. \$1.20, net.)

The Golden
Greyhound

This belongs to what may be called the preposterous school of romance, that in which nothing matters—least of all common sense—provided there be a treasure, a villain, and a girl. And this, it may be added, is a particularly silly example of its silly class. (The Golden Greyhound. By Dwight Tilton. Lothrop, Lee & Shepard Company, Boston. \$1.50.)

Hearts and Creeds An unusually good story by Anna Chapin Ray, whose art has steadily improved from a modest and yet admirable beginning. A willful beauty, confirmed in the Church of England, yet entirely undisciplined in character, marries a French-Canadian Catholic. The recognized cleavage in Canada between English and French residents, in social as well as in religious lines, is clearly elaborated in the development of the story. Two attractive Americans, brother and sister, a Parisian, and a real Englishman are introduced to complete the international company. Life in Quebec, politically and socially, passes before us in vivid panorama. The struggle between the deeply religious devotion of Lelen and the pettish obstinacy of his Protestant wife, culminating in the baptism of their child, does not show that wife in an enviable light. But other characters in the attractive story reclaim it from tragedy, and two most happy marriages recall us to life as it really is—a mingling of gold and dross. The pictures by Mrs. Stephens are really beautiful. (Hearts and Creeds. By Anna Chapin Ray. Little, Brown & Co., Boston. \$1.50.)

History of the Parish of Trinity Church New York Dr. Morgan Dix here brings the history of the ancient parish down to 1862,

when he became its ninth rector. The period

covered by this, the fourth, volume includes with the thirty-two years of the rectorship of his predecessor, Dr. Berrian, the last three years of Dr. Hobart, dating from 1827. The noble typographic form of the work, compiled by order of the Corporation, comports well with its dignity and wealth among New York's institutions. A variety of incidents that attracted much public interest in their time occur in this record. Great but transient excitement was caused by the refusal of nine clergymen of the vicinity to attend the consecration of the new church in 1846, as a protest against the Romeward tendency discovered in the request to wear a surplice and scarf on that occasion; so strong was the Puritan spirit not long ago. (History of the Parish of Trinity Church in the City of New York. Edited by Morgan Dix, D.D. G. P. Putnam's Sons, New York. \$5, net, per vol.)

Holland In this volume, as in former books upon Japan and Russia, Miss Singleton intelligently combines excerpts from well-known writers, such as Edmondo de Amicis, F. S. Bird, Freeman the historian, and a dozen or more others. Together they give an excellent idea of the country, its history, its people and their customs, and the book is naturally particularly full on the side of description. There are many well-chosen photographic illustrations. (Holland: As Seen and Described by Famous Writers. Collected and Edited by Esther Singleton. Dodd, Mead & Co., New York. \$1.60, net.)

This book by Dr. Jesus: An Charles Van Norden, Unfinished Portrait of Sacramento, a veteran Congregationalist minister, now retired from the pastorate, is a fresh sign of the changing time. The Christology of the creeds is, in his view, mythological; the teaching of the New Testament goes not so far. Sociologically, both Protestant and Roman Catholic Churches would amaze the Master whose name they bear. Of the three antichrists-dogmatism, ecclesiasticism, and capitalism-while the two former have become like Bunyan's decrepit giants, Pope and Pagan, the third now succeeds to the plenitude of power, rendering worldly the devout and unchurching a great social class. However just Dr. Van Norden's criticism of the churches, in which he has not gone beyond the facts apparent on one side, it would be much more just had equally apparent facts on the other side been recognized. The social aspects and obligations of Christianity are now being pressed to the front as never before, and (though much remains to be done) with steadily increasing energy and

effect. To say that "two-thirds of the church edifices should be sold, and at least half of the educated ministers and priests allowed to seek other employment," is more vehement than judicious. Fewer and better, undoubtedly, both of churches and ministers, would be for the credit and influence of both. The true line of betterment Dr. Van Norden well discerns. Instead of contenting itself with trying to pluck individuals out of the world's evil, the Church must also war against the world's evil, devoting itself to the imperiled social interests with which the yet unapplied half of the Gospel of Jesus is concerned. Then, as we understand the somewhat enigmatical title of the book, the portrait of Jesus, to exhibit which in convincing impressiveness is the mission of his Church, would no longer be unfinished. (Jesus: An Unfinished Portrait. By Charles Van Norden. Funk & Wagnalls Company, New York. \$1, net.)

Miss Lillie Hamilton The Joy of Life French has won for herself an enviable place as a clear-eyed commentator upon every-day life. This delightful little book of unpretentious essays bids us remember that joy is a possible possession for us all. She discusses such topics as the cultivation of ideals, mothers and daughters, friends of the family, generosity as a force, and the manner of receiving, and the eve lights upon many pungent, sensible, quotable sentiments-exactly the sort we would like to hand over to our friends-perhaps to be returned by them on our next birthday, after the manner invented by Elizabeth of the German Garden and her bosom friend. Altogether this is a pleasant, helpful, hopeful little book. (The Joy of Life. By Lillie Hamilton French. The Frederick A. Stokes Company, New York. 80c., net.)

Maid of Athens
A rather foolish story founded upon the love of Byron for the Maid of Athens to whom he addressed the verses so long popular with lovelorn swains. None of the several attempts to rehabilitate Byronic incidents in fiction has been successful, either artistically or morally. (Maid of Athens. By Lafayette McLaws. Little, Brown & Co., Boston. \$1.50.)

Paul and Fiammetta

Kate Douglas Wiggin was quite right to
bring about the introduction of Mrs. Harker's
natural and lively English children to the
American lovers of her own Rebecca, Timothy, and Polly Oliver. There is genuine
fun in the doings of Paul, Fiammetta, and
their playmates, and although they can be
mischievous on occasion, they are never vulgar or "tough." As the Introduction says,

\$1.25, net.)

the book is thoroughly English, yet with all its local color it sounds the human and universal note. (Concerning Paul and Fiammetta. By L. Allen Harker. Charles Scribner's Sons, New York. \$1.25.)

The Seven Follies of Science

of Science

The Science of Science because they were insoluble by their nature are here described in detail. Such "follies" were: squaring the circle, perpetual motion, the elixir of life, the transmutation of metals. These and a few less well known are examined by the author and present some curious aspects of study. (The Seven Follies of Science. By John Phin. D. Van Nostrand Company, New York.

The Snare of Strength

An Australian novel abounding in local color. Mining, politics, and love-making divide the interest about equally. While the book is defective in proportion and in literary art in some respects, the author has a genuine knowledge of human nature, and often writes acutely and with real grasp on his characters and their motives. (The Snare of Strength. By Randolph Bedford. Herbert B. Turner & Co., Boston. \$1.50.)

The Story of Queen

Queen

Henrietta Maria

Several attempts have been made to tell the story of the life of Henrietta

Maria "la reine malbau

Maria, "la reine malheureuse," who contributed so largely to the working out of the fatal destiny of the Stuarts; but no one has hitherto ventured to present it with the fullness to be found in the latest biography, a bulky, two-volume work by I. A. Taylor. It is unlikely that the experiment will be tried again. The facts necessary to a correct understanding of Henrietta Maria's character and her misguided efforts to re-establish Catholicism in Protestant England may be sufficiently set forth in remarkably small compass; and the endeavor to expand them can result only in a superfluous survey of movements and events with which Henrietta Maria herself had comparatively little to do. This is the case with the present "Life." Seeking equipment for the task in hand, the author has explored innumerable memoirs and documents, and has, quite properly, become, as it were, saturated with the material; but, unfortunately, also has insisted upon the reader going through a like process of saturation.

Nothing is too trivial, too insignificant to be excluded, and we consequently have an astonishing mixture of biography and annals, in which the figure of the bigoted and unhappy mother of the last two Stuart kings recedes vaguely into the background. There is about the work a certain freshness of interest, due in part to the facility with which the Royalist point of view is apprehended; and, although dimly, a juster perception of the qualities and motives of Henrietta Maria is afforded than by most writers. But the final verdict must be unfavorable. The narrative is, as has been said, unnecessarily extended; it is also discursive, and otherwise bears marks of an unaccustomed hand, and it is animated by an exaggerated sentimentalism which affects almost every personage discussed. We began the book with high anticipations; we closed it in the certainty that there is still ample room for a biography of Charles I.'s Queen. (The Life of Queen Henrietta Maria. By I. A. Taylor. Two volumes. E. P. Dutton & Co., New York. \$7.50, net.)

Their Husbands' Wives or "novelettes" touching on marital felicities and infelicities. The list of writers includes Mark Twain, Elizabeth Stuart Phelps, Emery Pottle, Grace Ellery Channing, George Hibbard, and Abby M. Roach. (Their Husbands' Wives. Edited by William Dean Howells and Henry Mills Alden. Harper & Brothers, New York. \$1.)

This volume of selections Thirty Songs represents eleven composers, and it is interesting to note that the compilers include the late Edward MacDowell and Adolf Jensen in this group of "Masters." Mr. Finck, who is well known to all interested in music as the musical editor of the New York " Evening Post," is one of the compilers. His collaborator in this work, Mr. Bentley, is Director of Music in the public schools of Washington. Naturally, individual taste might suggest the addition of other songs or the omission of some here included, but it will be noted that the editors sensibly make no claim of absolute superiority, but give the volume a title which justifies all its contents. (Thirty Sterling Songs. By the Great Masters. Selected by Henry T. Finck and Alys E. Bentley. Allyn & Bacon, Boston. \$1.)

Letters to The Outlook

PRIVATE CAR LINES

To my mind there is no difference between the private car lines on every railway running into New York and the Armour private cars operated from Chicago. The owners of these private car lines are out to make money for their own private interest, not to benefit any one else but themselves. That this state of affairs should be allowed is entirely the fault of the Legislature which granted permission to the various railways to be built; that permission was given to benefit the country at large, and before any railway could be built that permission had to be obtained; this proves that the Legislature is master of the position, and the Legislature, having made a bargain, should have seen that the parties with whom they dealt carried out their part of the bargain properly. If the public has been hurt by these various car lines, it is the fault of the Legislature. It seems very strange, but nevertheless it is a fact, that there is not a single line of railway running into New York but what has some private car line. Who owns these private car lines? It has been stated, and I believe it is more or less correct, that these private car lines were started by some of the largest shareholders of the various railways, and started with the express purpose of receiving part of the profits on that particular railway to the detriment of the regular shareholders.

It is a well-known fact that some of these railways coming into New York now are not paying any dividends on their ordinary shares, and that in other cases where dividends are being paid, much greater dividends could have been paid had the full return for the work done gone into the coffers of the various railways; but their partner, the private line, has eaten up a lot of their profit. It is sufficient for such private car lines to even have their name on any through bill of lading, even if the goods are not in their own car, for them to receive, for a distance between Chicago and New York, \$12.50 per car out of the \$60 to \$90 received by the railway. Then, if the goods are in their car, they get a further large proportion of the freight money, merely handing over to the railway, their partner, the haulage fees, which is all the shareholder gets out of the business. If a shipper in New York wants to send a carload of any particular kind of merchandise over any two lines of railways, and he asks for the freight rate, say, from New York to

Milwaukee, or any such similar place, he is at once referred by the freight clerk of the railway to those particular car lines which are able there and then to give a through rate to those places.

With the knowledge that these private car lines are not working for the public, it can be at once seen that even the staffs of the various railways are so manipulated that they are unable or are not allowed to quote a through rate. You must apply to the private car lines, and, as all railways have their private car lines, there is no "kick" coming from any railway; the only people dissatisfied are the general public, who are being simply "milked" for all they are worth; and the men who ought to see that these charges are just and proper between their lines of railway and the public have their hands tied or their eyes closed; but their pockets are still open, because they are receiving a portion of these illicit charges from the private car line.

It is a well-known fact that there is a large quantity of merchandise charged considerably more for a shorter distance than for a longer distance. There are many places in this country two to three thousand miles from New York that pay a less charge than a place a little more than half-way. For this condition of things the private car lines are largely answerable, and until the private car lines are put out of business the question of rates cannot be properly adjusted.

New York. W. N. WHITE.

THE CHRISTIAN ENDEAVOR IDEAL

The correspondent whose letter you print in The Outlook for March 10 writes so forcibly about Christian Endeavor, but at the same time gives utterance to so many misconceptions of the Society, that I am sure the editor will allow me a few lines for a reply.

"After a quarter of a century," he says, "it becomes evident that Christian Endeavor has not learned to adjust itself to present and changing conditions."

Does he mean that the more than fifty thousand pastors of Christian Endeavor Societies are still living in a former decade? It is they that determine what the sixty-seven thousand Christian Endeavor Societies shall be. It is absurd to suppose that Dr. Clark and his co-workers could determine it if they wanted to.

Or does he mean that the central organiza-

Digitized by Google

tion, the United Society of Christian Endeavor, is behind the times? If so, it is doing its best to catch up. Its Outlook Committee-in whose work The Outlook should sympathize—is this very week sending out, at considerable cost, an elaborate set of questions. A copy is sent to every pastor of a Christian Endeavor Society in the United States and Canada. These questions take up fully and frankly a large number of important points regarding the Society, and call for the experiences and wisdom of the pastors on these matters, and any other matter that any one may wish to bring up. The members of this Committee are Professor Howe, of the Washington and Lee University; President Landrith, of Belmont College; Dr. Floyd W. Tomkins, Dr. Clark, Mr. William Shaw, Dr. Teunis S. Hamlin, Professor H. B. Grose, Dr. E. F. Hallenbeck, Dr. F. D. Power, Dr. D. J. Burrell, and myself as Chairman. This Committee is not hypocritically trying to work in a special plea under the pretense of seeking information, but it really wants to know what the pastors of the country think best to be done about the conduct of the Christian Endeavor Societies; and the results will be weighed fairly, published honestly, and used sincerely as guides to further action.

It would be easy to take up your correspondent's statements about a decline of interest in Christian Endeavor, especially in the societies that have been longest in existence, and show how untrue those statements are. A misapprehension far more important than this, however, is the writer's assertion that the Christian Endeavor Society is based upon "a wrong conception of the nature of the Christian life."

The difficulty in your correspondent's mind lies, evidently, with the form of pledge or covenant which is sent out by the United Society as a suggestion for the use of pastors who do not care to prepare a different form. Why is it that so many obstinate men will have it that the United Society prescribes a pledge for Christian Endeavorers? From the start it has been proclaimed in every possible way that every pastor was at liberty to write his own pledge, put in just what he pleases and leave out just what he pleases. "Why all this legislation?" your correspondent asks. There has been no legislation. If there had been, the pastors would not submit to it. The United Society has no authority to legislate, and never has assumed such authority.

Up to the present time the United Society has required as an essential for enrollment that the local societies use some kind of pledge or definite agreement—just the kind

that the pastor thinks best suited to the local needs. Thus far the more than one hundred Christian leaders, from more than thirty denominations, that make up the Board of Trustees have seen no indication that any but a very small minority wished them to take any other position. The questionnaire now made by the Outlook Committee will show whether the Trustees are right in that feeling. A smaller questionnaire, consisting of more than two thousand ministers, taken at random, which I made several years ago, shows an enormous majority that wished the United Society to continue to require from the societies some form of pledge.

It would be very easy to show that the Christian Endeavor pledge sent out by the United Society as a suggested form is not at all the legalistic document portrayed by your correspondent. I do not know a Christian Endeavor leader anywhere who would not readily agree with every word he writes about the need of absolute sincerity in promise-making and promise-keeping, the folly of exalting the letter above the spirit, the need of loyalty to moral convictions rather than conformity to rules. The ideal of Christian Endeavor is, and always has been, precisely that "natural and normal life" which he urges, and exactly that "natural expression of the heart, not manifesting itself exclusively or primarily in public testimony, but in all the varied activities of life." If there is any way to urge that ideal upon our young people that the Christian Endeavor leaders have not tried, they want to know it, and they will try it. An experience of thirteen years as editor of the Christian Endeavor organ has brought me in contact with many thousands of Christian Endeavorers, and I know, what any one else may learn, that they are as free from formalism, as devoted to realities, and as eager for wide and practical services, as any set of Christians on earth.

Boston, Massachusetts.

[The correspondent concerning whose letter Mr. Wells writes objected, not to any particular form of the pledge which the Christian Endeavor Societies use, but to the principle of requiring a pledge of any kind, or rather of laying down the acceptance of a pledge as prerequisite to a Christian lite. It is not to the form of law that he objected, but to the spirit of legalism.—The Editors.]

SHAKESPEAREAN RESEARCH

Concerning the article "A Shakespearean Find," by W. J. Rolfe, in your issue of February 17, may I be allowed a word? This new "item," apparently authentic, and interesting enough as showing the ease with which

Amos R. Wells.

the "myriad-minded" "Shake-Speare" could write to order an "impresse" for a noble patron, as it is said he did a play by royal command, is nevertheless but another of those "scraps of information," as Emerson calls them, so assiduously gathered and put forth with expert authority by Halliwell-Phillipps in his "Outlines of the Life of Shakespeare," a copy of which, second edition, London, 1882, is now before me. These things, however, are not at all elucidative of the tangle in which the personality and work of the "William Shagspere" of the Marriage Bond, the "Shake-Speare" of the Quartos, the "my cozen Shakspear" of the Thomas Greene Diary, the "Mr Shakspeare" of this new "find," and the "Mr William Shakespeare" of the 1623 Folio, and other variants, has been handed down to our bewildered but questioning age. All will, however, heartily concur in Mr. Sidney Lee's implied hope that "documents which are yet to be discovered" will furnish the much-needed light.

In the study of this important and interesting question it is well to adhere closely to ascertained fact, and when making citations it is but proper to be strictly accurate. In this connection Professor Rolfe seriously errs. He says: "Fourteen years earlier (in 1599) his father had obtained the honor of a coat of arms from the College of Heralds, and he and his son thus became 'gentlemen.'" On page 573 of the "Outlines," among the various items of the "Documentary Appendix," will be found this:

"XII. Draft of a grant of coat-armour proposed [italics mine] to be conferred on Shakespeare's Father in the year 1596. From the original manuscript preserved at the college of arms, the interlineations being denoted by Italics" The document is given in full and is thus commented upon in the text, p 87: "There is preserved at the college of arms the draft of a grant of coat-armour to John Shakespeare, dated in October, 1596, the result of an application made no doubt some little time previously. It may be sately inferred, from the unprosperous circumstances of the grantee, that this attempt to confer gentility on the family was made at the poet's expense. This is the first evidence we have of his rising pecuniary fortunes, and of his determination to advance in social position."

Respecting Professor Rolfe's "grant" of 1599 the same high authority again furnishes "documentary" evidence, p. 589:

"XIX Draft of a grant of coat armour proposed [italics mine] to be conferred on Shakespeare's Father in the year 1599. From the original manuscript preserved at the college of arms, the interlineations being denoted by Italics."

Again quoting the document in full, the distinguished author and compiler comments upon it on p. 116 of his text, thus:

"Towards the close of this year, 1599, a second attempt was made by the poet to obtain a grant of coat-armour to his father. It was now proposed to

impale the arms of Shakespeare with those of Arden, and on each occasion the most ridiculous statements were made respecting the claims of the two families. Both were really descended from obscure English country yeomen [italics mine], but the heralds made out that the predecessors of John Shakespeare were rewarded by the Crown for distinguished services, and that his wife's ancestors were entitled to armorlaf bearings. Although the poet's relatives at a later time assumed his right to the coat suggested for his father in 15%, it does not appear that either of the proposed grants was ratified by the college [italics mine], and certainly nothing more is heard of the Arden impalement."

In this connection it may be profitable to inquire how the same hand could sign such ill-founded statements in support of a claim for a grant of "arms," and again in his will testify to his supreme aspiration to found a "family," and endeavor to provide for so doing, and should (Lear III., 6) pen such a sneer: (Fool, log.) "No, he's a yeoman that has a gentleman to his son; for he's a mad yeoman that sees his son a gentleman before him." And again, in "Winter's Tale," V., 3, where Autolycus, the Shepherd, and the Clown bandy the phrase "gentleman-born," and the Clown says: "But I was a gentleman born before my father: for the king's son took me by the hand and called me brother, ... and so we wept: and these were the first gentleman-like tears that ever we shed."

A rapidly growing number of earnest students profess to have a clear understanding of these curious contradictions, are ready to give a rational explanation, and are able to advance substantial "foundations of belief," but that's "another story," and a long one, not possible here.

I may, however, perhaps be allowed a concluding word in attempted disabuse of another misconception founded on the supposed "gentility" of the bearer of the assumed " coat-armour," and his honored sepulture among the "gentry" in Stratford church. The impression seems to be widespread that this high honor of burial and monument was accorded by the authorities of town and gown as a special testimony to the worth and achievements of a distinguished townsman. Not to speak of the antipathy against the profession of actor, to which the deceased belonged, or the repressive legislation affecting those who followed the calling and were classed as "vagabonds," as all tending specifically to deny and withhold such privilege I simply quote again from the "Outlines" of Halliwell-Phillipps, p. 171: "His remains were buried in the chancel, the selection of that locality for the interment being due to the circumstance of its being the legal and customary burial-place of the owners of the tithes." S. M. B.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

THE OUTLOOK COMPANY

Chicago Office, 1436 Marquette Building

287 Fourth Avenue, New York

Copyright, 1906, by the Outlook Company. Entered as second-class matter in the New York Post-Office.

Cleanable na ro Porcelain Lined Refrigerators

Excel all others in all practical and necessary features. The porcelain lining is real porcelain fused on sheet steel, and indestructible. This means a sweet, clean refrigerator no foul odors. The doors are air-tight. Ordinary refrigerator doors lock in one place only-The Leonard door lock (see cut) draws the door air-tight against the door frame, and locks it top, bottom and sides, so that air cannot get in around the edges. This means your ice bill is cut in half.

The shelves slide in metal bars and are adjustable to any height (see cut)-very convenient. By putting in extra shelves for pies, etc. we increase the capacity one-third without extra cost.

There are nine walls to preserve the ice—(see cut below.)

The price is 1/3 less than tile lining, and the refrigerator better. For sale by all the best dealers, or will ship direct from factory. Freight prepaid as far as the Mississippi and Ohio Rivers. Beware of imitations made with white paint: the lead is poisonous, you can scratch it with a fin.

LEONARD LOCK that makes it Grand Rapids Refrigerator Co. AIR TIGHT. 17 Ottawa St., Grand Rapids, Mich.

This is the

Cross Section of Leonard Cleanable Refrigerator.

This Style, 35x22x46; Polished Oak Case. Quarter Sawed Panels. \$27.50

Write for free sample of porcelain lining and catalog showing 50 other styles.

Control of Control

The Pan-American

Programme

Last week the programme of subjects

to be considered by the forthcoming Pan-American Conference at Rio de Janeiro was unanimously approved by the Bureau of American Republics. The programme was prepared by a committee of which Mr. Root, Secretary of State, is chairman, and included the highest diplomatic representatives from Brazil, Argentina, Chili, Costa Rica, Mexico, and Cuba. Among the subjects for consideration are the reorganization of the Bureau of American Republics on a more permanent and efficient basis; a resolution recommending to the different republics the extension for a further period of five years of the arbitral treaty for pecuniary claims agreed upon at the previous Conference; the creation of a committee of jurists, to prepare for the consideration of the next Conference a draft of codes of public and private international law; a resolution embodying the principle that a naturalized citizen who renews his residence for a period exceeding two years in the country of his origin, without the manifested intention of returning to the country where he was naturalized, be considered to have renounced his naturalization in the latter country; the development of commercial intercourse among the American republics, with special attention to the greatest possible dissemination of statistical information; the simplification and co-ordination of the customs and consular laws; uniformity in patents and the international registration of trade-marks; sanitary police and quarantine; copyrights; and, finally, the Pan-American railway. More interesting as world questions than any of the above, however, we note: First, a resolution affirming the adherence of the American republics to the principle of arbitration for the settlement of disputes arising among them, and expressing the hope of the republics taking part in the Conference that the International Conference to meet at The Hague shall agree upon a general arbitration convention that might be approved and put in operation by every country. Secondly, perhaps a still more important reference to The Hague in the Rio de Janeiro programme is found in a resolution recommending that the forthcoming Peace Conference there be requested to consider the extent to which the use of force is permissible for the collection of loans or debts of a public character.

1

The latter proposal involves The Drago what is popularly known as Doctrine the Drago Doctrine. republics to the south of us earnestly desire that this shall be definitely engrafted upon recognized international law at the next Hague Conference. The first Foreign Minister in our time to emphasize this doctrine, namely, that force shall not be used to collect public debts, was Dr. Luis Drago, the Argentine Minister of Foreign Relations, but the first great Minister to bring it forward as a practical plan was Alexander Hamilton, nearly a century ago. In principle it is entirely sound. It enters into the Rio programme only to the extent of permitting consideration of a recommendation to a world conference as to how far force may be used by a foreign Power in the collection of debt, the question proper being left for settlement at The Hague by a vote of all the world powers as well as of the Central and South American republics themselves. Unlike the procedure followed in calling the first Hague Conference, at which the Western Hemisphere was represented only by this country and Mexico, the other American republics are also invited to the second

Digitized by Google

President Roosevelt originally called the second Hague Conference, but instantly stood aside when it was intimated that the Czar wished the honor. Perhaps unintentionally, the Czar has taken a strange way to show his appreciation of President Roosevelt's courtesy. He has called the Hague Conference for July, the very month for which the Pan-American Conference had long been announced. It may be that the Russian Foreign Office was in ignorance of the call for the Rio meeting; we notice, however, that though the Czar's attention has been drawn to that fact, he has not suggested deferring the Hague Conference. This seems doubly unfortunate, for the Russian Government has also been informed that the instances above mentioned are to be referred after discussion to The Hague, which, of course, could not be done unless the Rio Conference preceded the other. Furthermore, the American republics are, in general, sending their ablest men to Rio; in many, perhaps in most, cases it had been expected that these men would also proceed to The Hague, as being peculiarly well equipped to present the two questions at issue before that body; the particular inconvenience to this country is manifest, as Secretary Root would not be able to keep in close touch with both Conferences, as he had intended. It has been suggested that the Czar's call has been also supported by the German Emperor, who would not willingly have the Drago Doctrine recognized or even discussed at The Hague; also that it was devised to prevent the South American republics from taking part in the Hague Conference. But these rumors have been credibly and officially denied in Germany, and it is probable that this conflict in the dates of these two important international councils will be satisfactorily arranged.

æ

Peace Between Hungary and the Crown

Last week the Hungarian coalition leaders,

fearing a period of absolutism if the elections were not held on the date prescribed by the Constitution, compromised with the Crown. In this the advantage

certainly lies with the latter. The Magyars, or Hungarians, a minority in Hungary, outnumbered by the total of all the other races, have hitherto held political supremacy, and have insisted upon the use of the Hungarian language and flag in the Hungarian contingent of the Imperial army. Francis Joseph, the Emperor-King, has refused this because it would impair the Dual Empire's integ-On the consequent refusal of the Hungarian Parliament, controlled by the Magyars, to vote supplies, Francis Joseph declared that he would favor universal and equal suffrage, an announcement which not only carried satisfaction to the practically disfranchised non-Magyars, but also brought disintegration and dismay into the ranks of the Magyars Confronted by a virtual themselves. defeat, and influenced meanwhile both by the sovereign's firmness and by the people's impatience, the Magyars compromised as follows: The Emperor-King assents to the formation of a new Magyar Cabinet, to carry out the elections this week under the old law, and to hold a session of Parliament in May. session the Magyars guarantee to pass the budget, the new international commercial treaties, to maintain in every way the existing condition of things between Austria and Hungary, to permit the passage of a bill providing for universal suffrage, and then for Parliament to terminate its labors, allowing the election of a new one under the universal suffrage system, the Cabinet to be re-formed conformably to the desires of the parliamentary majority. As a result of this happy outcome the Emperor-King asked Dr. Alexander Wekerle, a former Hungarian Premier, to form a Cabinet. Dr. Wekerle has satisfactorily succeeded in his task. including in his Cabinet such strong men as Count Apponyi, well known in this country, and Francis Kossuth, a son of Louis Kossuth, the great leader of 1848. The choice of Dr. Wekerle is particularly auspicious because, unlike the statesmen just mentioned, he has figured little in the contest between Francis Joseph and the Magyars. Few Ministers have more fully commanded the confidence of the people, largely because it was seen that his plans excited the opposi-

tion now of the great Magyar nobles, now of reactionary Roman Catholics whom the people distrust. Dr. Wekerle's achievements as Finance Minister of the Empire and the two great civil reforms he has accomplished—namely, the establishment of civil marriage and liberty as to the religious education of children of mixed marriages-are a warrant for believing that he will be an admirable Prime Minister in the opening of the new era of Hungarian politics and progress based upon popular suffrage.

On Saturday of last Democracy Triumphs week and on Monin Russia day of this week the electoral colleges in many of the fifty-one provinces in European Russia elected members to the new National Parliament-about one-half of its entire membership. The result was an overwhelming victory for the Constitutional Democrats. Few reactionary candidates were elected, and even the "Octoberists "-so called because they are content with the reforms outlined in the manifesto of October 39, 1905—scored but seldom. Earlier in the week the strength of the Constitutional Democrats had become so manifest that a combination or "block" of all their opponents had been formed first with reference to the St. Petersburg primary election. The "Octoberists" and Progressive Economists combined with the Law and Order, Trade and Industries, and Conservative parties, but while the " block " received one vote, the Constitutional Democrats, on the average, received two. In St. Petersburg, as throughout Russia, considering the fact that the voters were exercising the right of citizenship for the first time in their lives, there was little confusion, but the St. Petersburg election was disgraced by the Government itself. No sooner had the Constitutional Democrats elected Mr. Miliukov and Mr. Hessen as delegates to the Provincial Convention than the Election Commission annulled the action on the ground that these men were under indictment in connection with the suspension of a newspaper of which they were editors. The Commission thereupon replaced them by Conservative candidates who received scarcely a tenth of the vote cast for those unseated. The action of the authorities of course aroused resentment in Radical circles, particularly as the Commission had taken no exception to the candidates before the balloting. The legal standing of the elected Constitutional Democrats should have been defined before the election, if they could not properly act in a legislative body. As it is, the two men to whom the Commission has given certificates are not only not the choice of the people, but are men whom the people distinctly repudiated. This injustice will only intensify and encourage the Liberals and Radicals to follow up the sweeping character of their general victory. We hope that this victory will ultimately result in the Emperor's issuance of a Constitution.

Less startling than

Democracy Triumphs in Finland

the triumph of democracy in Russia is that in Finland; but it is quite as significant, because it is a long step towards the restoration of Finland's ancient liberties. The new election law has now been completed, and, it is believed, will be entirely satisfactory to the Finns. It is virtually a new constitution. It provides for a Diet of one chamber of two hundred deputies. elected for three years by the various districts. Suffrage is granted to all adults twenty-four years old, regardless of sex, only public charges and criminals being excluded. There will be annual sessions of the Diet, lasting ninety days, beginning February 1, 1907. The Diet will elect its own president and vice-presidents, who must subscribe to an oath to protect the rights of the Emperor, as Grand Duke of Finland, and the Diet, according to the fundamental laws of the Grand Duchy. The sessions are to be opened and closed by the Emperor or his deputy, who will submit the Imperial programme for legislation, the budget, etc., and the bills introducible, covering all subjects except the fundamental laws and the organization of the land and sea defenses. Bills which pass their third reading become laws without the approval of the executive or Emperor. The sessions will be public, and both the Finnish and Swedish languages may be used in debates.

(A)

This is an age of organ-English ization and combination. Trades Unions The combinations of capital have in some cases become monopolistic and are being properly dealt with But labor by legislation and the courts. has an equal right to organize. justified that right by the achievements of labor unions in raising, not only the standard of wages, but the condition of workingmen. As to the status of trades unions themselves, the question has for some years been a particularly interesting one in England. It has been now newly defined by a bill introduced in Parliament in fulfillment of pledges given to the Labor party, which did so much to put the present Liberal Government into power. The bill is a direct outcome of the Taff Vale case, which arose from the great strike in the Welsh coal-mining district in 1900. The Taff Vale Railway Company contended that the Amalgamated Society of Railway Servants had indulged in malicious molestation, intimidation, and other unlawful acts for which the railway asked damages. The Society, backed by the trades unions, bitterly contested the suit. which was fought through the different courts, the decision being finally made in 1902. It held that the Amalgamated Society was responsible for its own acts or for the acts of its agents, and was liable to be mulcted in damages for actual injury done. Ever since this decision established the financial responsibility of unions for damage inflicted in their behalf, English labor leaders have been seeking legislative immunity for union funds. In explaining the features of the Government bill the new Attorney-General said, in the House of Commons, that the usefulness of trades unions is curtailed because their undoubted right of "peaceful persuasion" had been cut down to the point of extinction, and particularly because funds contributed to provide against sickness and lack of employment were

now held liable to meet claims based upon the repudiated acts of unauthorized officials. The bill therefore provided that no act of the trades unions should be held to be unlawful if such act is lawful when committed by an individual, set forth in express terms the right of peaceful picketing, which, the Attorney-General said, was an essential part of the right to strike, and defined the law of agency as applied to trades unions, making it impossible to claim redress from union funds for any act unless it was clear that the act was authorized by the governing body of the unions. In regard to the demand for the complete immunity of trades union funds from attack, the Attorney-General declared that he did not think it right to create a special privilege for the proletariat.

Cries from Is Labor to be Laborite benches a Privileged Class? showed that precisely this special privilege was demanded. The Laborites announced their unvielding opposition to anything short of complete immunity for union funds. In this opposition the Laborites were supported by the Irish. Together they decided instantly to test the opinion of the House with a bill which they had prepared, unless the Government measure were extended as they desired. To the astonishment of many, the Government capitulated. On the following day the following indefensible amendment was added to the bill:

No action shall be brought against a trades union . . . for the recovery of damages sustained by any person or persons by reason of the action of any member or members of such trades union or other association.

Under this bill, so amended, unions would not be held in damages for acts committed either by their unauthorized or by their authorized agents. The Attorney-General's fear that a special privilege for the proletariat might be created will probably be justified if the bill, now amended by his own Government, should pass. It would put trades unions in a position free from responsibility, one enjoyed by no other individual, corporation, or community in

England. The new Government apparently does not know its own mind as regards labor. The Premier's vacillation is due, not to the fact that with the Liberals proper he could have been beaten by the Laborites and the Irish together, but by reason of the fact that, whereas the eighty Irishmen remain eighty in Parliament after Parliament, there is little limit to the possible increase of the fiftyfour Laborite members. It is just possible that even so far as a present vote is concerned the Premier may have feared a victorious conjunction of hostile elements through the assistance to be given by Conservative-Unionists to the Laborites. However this may be, one principle is clear: that the right of organization and combination carries with it a corresponding responsibility. Neither capital nor labor should enjoy the privilege of combination and escape the responsibility.

The

Disaster and

emergence of fourteen men from the Human Sympathy mines at Courrières, in the Department of Pas-de-Calais, France, three weeks after a thousand and more miners had been buried within them by an explosion, and several days after all attempt at rescue had practically ceased, aroused last week the anger of the populace against the officials of the mines, and particularly against the engineers who conducted the work of salvage. The belief is widespread that a great number of the entombed miners have slowly starved to death because the officials neglected to put forth every possible effort to save life. In the French Chamber of Deputies charges of the most serious nature were made against the mining companies. It is difficult to determine whether these charges have any foundation in fact. The Minister of Public Works has promised a Government investigation. In contrast with the inhumanity implied by these charges, there was evoked by the disaster an impressive display of human sympathy and co-operation. At the very time when the relation between the Government of France and the Government of Germany was strained by the difficulties in the Moroccan question, Ger-

mans were hastening over the border to give help to their French fellow-men. The disaster which befell those French miners obliterated national differences.

Scenes of terror and mani-Vesuvius festations of titanic and in Eruption elemental fury accompanied the violent eruptions of Vesuvius last week and on last Sunday. Fortunately, little loss of life is so far reported, but one or more towns have been partly destroyed, some villages have been abandoned, and hundreds of poor peasants and villagers have been driven helpless from their homes and their little belongings. It is impossible as yet to give the present eruption its relative place in importance with the twenty-five or thirty outbreaks large enough to be especially chronicled in history since the appalling disaster of 79 B.C. which overwhelmed Pompeii and Herculaneum. The London "Times" correspondent asserts that the lava flow has exceeded any for two centuries; on the other hand, Professor Blaserna, of Naples, says that he considers the eruption less alarming than those of 1872, 1892, and 1894, and holds that Naples has nothing to fear except the discomfort of the ashes. It is worth noting that Vesuvius, after some years of comparative inactivity, burst into violence in 1902, just after the Martinique disaster, and has been sporadically active ever since. The present outbreak has been marked by the creation of one or more new craters, by terrific explosions throwing up huge incandescent rocks three thousand feet in air, by incessant rumblings, and by trembling of the earth for a great distance; while a great river of lava, five hundred feet wide, destroyed the funicular railway and the hotel, drove Dr. Mattucci, the director of the observatory, from the place and probably destroyed the observatory, invaded and partly overwhelmed the town of Boscotrecase, injured some parts of the towns of Ottajano and Torre Annunziata, threatened Boscoreale and Pompeii, and drove away in very real danger the people of many hamlets on the side of the mountain or near its

foot. An eye-witness gives the following description of the scene on Saturday:

Along the road I met hundreds of families in flight, carrying their few miserable possessions. The spectacle of collapsed carts and fainting women was frequent. When one reached the lava streams, a stupefying spectacle presented itself. From a point on the mountain between the towns I saw four rivers of molten fire, one of which, two hundred feet wide and over forty feet deep, was moving slowly and majestically onward, devouring vineyards and olive groves. I witnessed the destruction of a farm-house which was enveloped on three sides by lava. Immediately overhead the great crater was belching incandescent rocks and scoriæ for an incred-The whole summit was ible distance. wreathed with flames, and a perpetual roar was heard. Ever and anon the cone of the volcano was encircled with vivid electric phenomena, amid which a downpour of liquid fire on all sides of the crater was revealed in magnificent awfulness. In the evening there was a frightful shock of earthquake, which was repeated at two o'clock on Sunday morn-Simultaneously the lava streams redoubled their onrush, and men, women, and children fled precipitately toward the sea. The lava had invaded the road behind them.

Ashes fell in quantities as far as Capri and Sorrento, and in Naples there was a general exodus from the shore to the heights, and very decided uneasiness despite the distance and the assurances of the scientists. The King and Queen have visited the disturbed district, and by their presence and sympathy have encouraged the sufferers.

60

After the Russian Government Ownership war a congress of Railways in Japan of representatives from Japanese chambers of commerce passed resolutions concerning hoped-for progress in finance, foreign trade, home manufactures, and transportation. the last-named domain one of the resolutions declared for a more specific "control of all the railways in the Empire as to their business methods." The Imperial Government itself has also its own matured plans for promotion of commerce and industry, and among them exactly this proposition for railway con-It would realize it by taking over the railways not owned by it—about twothirds of the total mileage. The first Japanese railway, built over thirty years ago, was constructed by the Government, not so much because of any prepossession favorable to Government ownership as because private capital was lacking. The lack continued for several years, but when railway-building by private companies began, it progressed twice as fast as did Government building. The estimated cost of nationalizing the privately owned lines is put at about two hundred and fifty million dollars, and would pay a handsome profit to the present owners. According to the Government's plan, the State is to acquire the privately owned railways by compulsory purchase if necessary, on the principle of eminent domain. As to payment, the Government's principle is, apparently, to pay to the present companies their prospective profits for twenty years, this being ascertained by multiplying by twenty the average yearly profits of the three years preceding the Russian war. No cash is Stockholders are to be paid in bonds bearing five per cent. interest and redeemable within forty-five years. The net revenues of the railways are to be devoted to paying interest on and redeeming the bonds. With characteristic Japanese caution, the transaction is to be effected, not all at once, but gradually, so that there shall be no market disturbance. This plan, when presented in a bill before the Japanese Parliament, passed the House of Representatives without amendment by a vote of 243 to The purchase should amply repay the State, both from the evident military and strategic value of the railways and also from the "control of their business methods," in view of the increasing commercial importance of the railways. As to the latter factor, it is estimated that after the extinction of the bonds the yearly net profit from the railways to the State will equal their gross receipts at the present time.

Chicago's Municípal Ownership Battle

The people of Chicago, on April 3, by a narrow majority, approved of Mayor

Dunne's proposition to issue Mueller Law certificates for the purpose of acquiring street railways, but failed to carry by a three-fifths vote the proposition to operate street railways. The vote

on the ordinance authorizing the issuance of certificates was 110,008 for to 106,669 against. The vote on the question of municipal operation was 120,911 for to 110,260 against. The latter proposition fell more than 17,000 votes short of the three-fifths requisite for adoption. city, therefore, may proceed to acquire street railways as soon as the validity of the ordinance shall be established by the courts and the certificates can be sold, but it cannot operate. It is cause for surprise that the proposition to operate should have received a larger vote than was cast in favor of the ordinance looking to mere acquisition and owner-The explanation is to be found in the detailed criticisms of the particular ordinance under consideration. The victory of Mayor Dunne was only partial where he and his friends had confidently expected it to be decisive and complete. Two years ago the Mueller Municipal Ownership Law was adopted by the vote of 153,223 to 30,279. At the same time, on a public policy proposition, the people expressed themselves in favor of municipal ownership by the vote of 121,957 to 50,807. A year ago, when Mr. Dunne was elected Mayor on the issue of immediate municipal ownership by a plurality in excess of 25,000, the people, by a vote of 152,135 to 59,013, opposed the granting of any street railway franchises whatever. In view of these figures, the closeness of the vote on April 3 last is significant. Of course the concrete proposition is bound to provoke more opposition than the general questions, such as the people have been voting on heretofore. But there is more to the dwindling majority for municipal ownership than this. Mayor Dunne's appointments and conduct of affairs generally have not been such as to inspire confidence in his administrative capacity. Mr. William Kent, who voted for the propositions, and who has long been identified with the progressive movement in Chicago, had this to say the day after election: "The votes do not show that Chicago is reactionary or willing to go back to abused and abusive private franchises; neither do they show that Chicago is tired and unwilling to continue the long

fight for justice and public rights. If my talks with many honest men who voted differently from my vote prove anything, they prove that Chicago wants evidence of executive capacity before undertaking tasks of such vital moment. Chicago pauses and hesitates and asks for a sign of official appointments that mean capacity to manage immense in-Chicago asks of Mayor Dunne terests. more proofs of executive efficiency than have yet been given, and if these proofs are given Chicago will take new courage to push on into new fields of democracy." A considerable negative vote was inspired by the desire of opponents to injure Mayor Dunne politically. Former Mayor Harrison, the day before election, came out in an interview favoring the general policy of municipal ownership, but opposing Mayor Dunne's particular proposition, in which he was seconded by officials of the Democratic party. Wards in which these leaders were active gave adverse votes. Some Republican organization leaders also worked against the adoption of the propositions. Under the circumstances it is perhaps surprising that the propositions received so large a vote as was cast for them. Undoubtedly the outcome will have a sobering effect upon Mayor Dunne, and may lead to the calling in of wiser counselors than those now surrounding him. Shortly before election Mayor Dunne announced an immediate plan of procedure that involves utilizing some one of the existing companies as a construction company to rehabilitate the properties and operate them on a revocable license until the city shall be able to take them over at an agreed valuation.

6

Direct Vote for a Senator held on March 28 in Arkansas afford a striking illustration of the possibility of modifying the Federal Constitution without the resort to the formality of an amendment. In other years the Arkansas voters have expressed their Senatorial preferences at the polls, but the members of the General Assembly have been held to be bound only by the vote of their home counties. A candidate might receive a majority of

the popular vote and still be defeated. At the last Democratic State Convention it was decided that the nomination for the Senatorship this year should be made at the general primary election, and that the candidate receiving the highest number of votes should be declared the party nominee. The two candidates, Senator Berry and Governor Davis, were asked to give the State Committee a written pledge to abide by the result of the primaries. In addition, the Committee secured pledges from most of the legislative candidates to cast their ballots in the Legislature in accordance with the expression of the party opinion. Therefore the indorsement of Governor Davis at the recent primaries practically insures his return to the United States Senate. A similar plan has been adopted by several other States. The trend of popular sentiment seems to be toward forcing Legislatures merely to ratify the decision of the people in the election of Senators, precisely as it has forced the electoral college to become merely a ratifying body. Apparently the Constitution is much more likely to be modified by such local arrangements than it is to be formally amended against the will of a hostile Senate.

High License The Ohio Legislature raised the saloon tax of the State in Ohio to \$1,000 during the session just closed, after one of the bitterest temperance fights on record, being the culmination of a series of new liquor laws enacted throughout its deliberations. Ohio has been near the bottom in the matter of taxing saloons, with a minimum tax of only \$350. It is estimated that the increase will add over a million dollars to the revenues of the State, and at the same time reduce the number of saloons by five thousand. Most potent in securing the passage of this law was the terrible mob spirit shown during the late Springfield riots, which necessitated the calling out of the State militia at a cost of \$25,000 to the State. second time in the past two years Springfield had been the scene of riotous disorder incident to the shooting of a white man by the negro element in Springfield's toughest quarters. Houses were burned

in return, homes destroyed, and some of the negroes, filled with fear and anxiety, were driven from the city. The citizens of Springfield attribute to the presence of low dives and cheap saloons in the negro quarters and in certain white sections their disgrace, and petitioned the Legislature to enact the \$1,000 license bill as a means of prevention of another similar outrage. Ten years ago, in spite of such appeals, this anti-saloon legislation in Ohio would have been wellnigh impossible, with the saloon influence at high tide in political affairs. then anti-saloon measures have been enacted with each succeeding session by increasing majorities, until the liquor power has largely vanished from the reckoning of the lawmakers of Ohio. is particularly evident at the session just closed in the enactment of four bills. including the raising of the saloon tax. The search and seizure law, which gives the right to officers to enter any place where there is any suspicion that liquor is being sold contrary to law, was passed for the benefit of those communities that had voted "dry" under local option laws, but were being infested with "speakeasies "and "blind tigers." The "Jones S remonstrance" law for residence districts in towns and cities, and the "Roberts dance hall" law, prohibiting the sale of liquors in the same place where a public dance is held, complete the list of the new anti-saloon measures. The wisdom of the Temonstrance law, as well as of other provisions of the local option system as it exists in Ohio, has been questioned by some thoughtful and public-spirited people; but whatever the specific defects of these laws may be, their general effect has been wholesome.

@

Kansas Oil Rate
Complaints

The complaint of the
Kansas independent
refineries and oil-producers regarding railway rates was considered important enough to warrant a
hearing by the Inter-State Commerce
Commission. This was lately completed
at Kansas City. The independents introduced much testimony to the effect
that while rates inside the State of
Kansas are, under the maximum freight

law, low enough to give liberal profits, the refineries cannot compete for business outside the State because of the high rates in effect beyond the State line. As an example it was shown that from Neodesha to Kansas City, Kansas, the rate is nine cents; to Kansas City, Missouri, half a mile farther, seventeen cents. It is claimed by the independents that rates have been raised on out of State shipments since the Kansas law took effect, making the cost of delivering oil so great that the independents cannot compete with the Standard, which makes part of its shipment through its own pipe lines, thus saving on freight. The railways admitted the high rates-with explanations. They claim that money is lost on the Kansas rates and that it would be injustice to extend those rates outside the State. The Commission asked for figures to sustain the roads' claims, and has taken the matter under advisement. The hearing emphasizes the difficulty lying in the way of independent oil refining and production if there is obstruction from transportation companies. The Standard Oil Company is said to have over \$10,000,000 worth of crude oil stored in the Kansas-Indian Territory field, all purchased at fifty cents a barrel. It is building and filling a 35,000-barrel tank each day. The independents are consuming about 3,500 barrels a day, mostly from their own oil wells. Of the 55,000 barrels produced daily in the Southwestern oil field only 12,000 barrels are credited to Kansas. the remainder being in the Indian Territory and Oklahoma, where the Standard is in full control. The Kansas investors in oil stocks have received no dividends for a year, and there is no immediate prospect of one. The contest, far from being finished, is only begun, and more drastic legislation may be expected when the next session of the Kansas Legislature meets. It is a safe prediction that the Kansas independents will not surrender though they may fight a long time before they secure sufficient advantage to resume profits on their investments in the oil field. It is probable, too, that some exaggeration appears in the ex parte statements of both sides, and that professional agitators and politicians have

taken advantage of the situation to make capital for themselves. But back of it all is a very real and earnest struggle for the maintenance of an important wealth-producing industry, and the success of the independents in conducting a profitable business, despite the opposition of the Standard, means a great deal to the people of the Western oil field. The decision of the Commission will do much to determine the future of the contest.

At its recent municipal Kansas City's election (April 3), Kan-New Mayor sas City, Missouri, was so fortunate as to secure for itself the services as Mayor of a man not only of the highest personal character, but also with expert knowledge of municipal affairs. Henry M. Beardsley, the successful candidate on the Republican ticket, is a lawyer who found time in the campaign to direct a canvass which raised nearly \$300,000 for a building for the Kansas City Young Men's Christian Association, of which he is President. For six years Mr. Beardsley has been a member of the upper branch of the Common Council, and for two years he has been President of the Board of Public Works. In this latter capacity he has directed the rehabilitation of the water plant, and has supervised other important public works in which many million dollars have been expended. He has been a close student of recent literature on municipal affairs, and is generally regarded in Kansas City as the bestinformed man on municipal subjects in the town. He felt that he could not afford to give up his professional work to become a candidate for Mayor, but finally yielded to the pressure of public opinion and to his sense of obligation to use his knowledge for the benefit of the community. Under instructions from Governor Folk, who controls the Kansas City Elections Board and the Police Commissioners, the town secured the fairest election in its recent history. The Governor himself visited the city on election day to see that his instructions were rigidly observed, and police interference at the polls and fraudulent voting, common in other elections, were

eliminated. The chief fight against Mr. Beardsley, aside from partisan opposition, came from the element that favors a lax enforcement of law. His vote was the highest ever polled by a candidate for Mayor in Kansas City. There was much independent voting. The Republican candidate for Auditor, and two Republican candidates for Aldermen, opposed by the Civic League, were defeated. The election was of unusual importance because the questions of a franchise for a company to supply natural gas and of a ten-year extension of the street railway franchises are to come before the new city administration for settlement.

Seattle and Municipal Ownership Seattle has lately elected William Hickman Moore

as Mayor on an independent municipal ownership ticket, defeating the regular Republican candidate by a plurality of but fifteen votes. The contest leading up to this result was marked by features significant of the rapid development of the sentiment in favor of municipal ownership. Seattle is normally a Republican city, the metropolis of a State which is overwhelmingly Republican in National affairs, which two years ago gave Roosevelt a majority over Parker of approximately three to one. Its city government has been continuously Republican in all its branches since 1898. A correspondent of The Outlook in Seattle describes the political situation and the recent campaign as follows:

Locally the Republican machine has come to represent chiefly the steam railroads, the street railway company which owns and operates nearly all the street railways of the city, and the liquor and kindred interests. The railroads are interested in having a "friendly" government on account of the fact that rapidly expanding business and facilities render it necessary for them to ask frequent franchises and other rights of the city, and also through the desire to keep down local taxation. The street railway company has sought to dominate politics as a means of preventing too strict a regulation of its business under its franchises, and as a means of securing additional franchises from time to time on favorable terms. The municipal ownership campaign was organized less than four months before the date for the election. The most active part in it was taken by certain leaders of organized labor,

with a large body of unionized workmen at their back. Consolidated with this faction was a Municipal Ownership League composed chiefly of business and professional men. Early in January these two organizations joined forces in calling a mass conven-tion for the nomination of an independent ticket to run on a municipal ownership platform. While that convention was open to all advocates of municipal ownership desiring to participate in it, it was actually attended by less than five hundred delegates. There was a lively contest in the nomination of a mayor, but all other nominations were made by acclamation, and there was so little of a scramble for places on the ticket that difficulty was experienced in completing it. The platform adopted was a declaration for general municipal ownership, and included a declaration denouncing the practice of ac-cepting political contributions from corporate interests. The Republican platform was to a large extent modeled after that adopted by the municipal ownership advocates, though it contained no declaration in favor of the municipal ownership of street-car lines, which plank in the independent platform became thereby the chief bone of contention between the parties. Both of the leading daily newspapers of the city refused to give active support to either party. A minor daily paper was subsidized by the Republican committee and circu-lated free during the campaign to every voter. Another minor daily paper remained independent and impartial, endeavoring to give the news of the campaign without color or prejudice. Unable to command the kind of newspaper support essential to their cam-paign, the Republican committee made liberal use of the billboards of the city, placarding them with declarations from the party platform, assertions regarding the abilities and capabilities of the Republican candidates, and veiled attacks on the integrity of the candidates of the opposition. These latter aroused so much antagonism that the members of the committee were forced later in the campaign to disclaim their authorship and shift that responsibility to the shoulders of a press agent. Seattle has already entered upon two important experiments in municipal ownership, one a gravity water system, and the other a water-power electriclighting plant, both of which have proven successful and highly profitable. These, together with the abuses and offenses of the privately owned street railway service, formed the chief line of attack. The Republicans attempted to shift the fight to the moral issue of an "open" or a "closed" town, but the independents met them on that ground with declarations even stronger than the Republicans cared to make lest they alienate some of their support of the wide-open element. Under the laws of Washington any city of the first class may, by popular vote, issue bonds for the construction or purchase of a street railway system or other public utility, the bonds so issued to be a lien only upon the

property so constructed or purchased and upon its earnings. In the recent campaign both parties pledged their councilmanic candidates to submit such a proposal to a vote at the earliest practicable time, and it is now anticipated that it will be submitted within a few months after the new Council comes in, in April. The people of Seattle won another victory in the recent election in the adoption by a vote of approximately eight to one of a charter amendment modeled after the Los Angeles charter provision, and reserving to the voters the power to recall from office a public official who does not give satisfaction to his constituents.

₩

The twenty-fifth anniver-The Tuskegee sary of the founding Anniversary of the Tuskegee Normal and Industrial Institute was celebrated by "a week of days," beginning on Sunday, the first of April, with special services in the great chapel, which seats easily the fourteen hundred students, the teachers and their families, and others who may choose to attend. was a sea of people all the week. main part of the programme was carried out on Wednesday and Thursday, on the arrival of the special train from New York bringing about a hundred men and women who are deeply interested in the wonderful work that has been growing with such unexampled strength and activity for a quarter of a century. The speakers represented both sections, both races, both sexes, and several denominations. To the Northern visitors present the most interesting features were the cordial indorsement of Tuskegee Institute and its Principal by such representative Southern men as Bishop Galloway, of Mississippi, and Dr. J. W. Abercrombie, President of the University of Alabama, and the addresses by negro speakers, both men and women, graduates of Tuskegee, giving account of their work for their race; one of the most interesting of these was the report by J: W. Robinson on the work of Tuskegee graduates in western Africa, carried on under the authority and at the expense of the German Government, for the promotion of the cotton industry there by the native population. Among the addresses from the North perhaps the most notable was that of the Hon. W. H. Taft on the significance and application

of the three constitutional amendments relative to the negro and his history. His speech was taken to represent the views of the Administration. In it he defended the right, and, we think, impliedly the wisdom, of attaching qualifications to the suffrage, provided they are not qualifications of race, color, or previous condition of servitude. Judging from the relative volume of applause which greeted his address and the contrary opinion of William Lloyd Garrison in favor of unqualified suffrage, the former opinion had the support of a majority of the negro audience. President Northrop's wholly extemporaneous address was a fine specimen of multum in parvo, and spontaneous and prolonged applause greeted the emphasis he laid on the idea that the material gains of the colored people are not the chief gains, but their increased ability to be of service to humanity in the highest and noblest This was in line with what was said by President Eliot, who, quoting Dr. Washington, added, "I could not find it possible to state in more precise terms the present needs of Harvard University than Dr. Washington has stated the needs of Tuskegee. They are the same for the two institutions: a considerable sum of money to be used at the discretion of the trustees to fill gaps and make improvements, to enlarge and co-ordinate the different branches of the institution. The real education which Harvard University has been trying to give for two hundred and seventy years is just the same thing that Tuskegee has been trying to give for twenty-five years: to teach youth the love of freedom, the love of truth, and the love of service. The two institutions have different histories, but their ends are the same." The music was good, the singing of the hymns by the great congregation of rich negro voices was inspiring, and the weather was simply perfect, so that in all these respects nothing more could be desired. Exhibits of all kinds, agricultural, historic, domestic, and academic, were disposed in different buildings and were crowded with visitors, while during certain hours of each day the academic and theory classes were in session and open to the

public. A pleasant incident in the celebration was the gift of a silver lovingcup to Booker Washington from the people of Mobile. His response was characteristically appreciative, as were his words with reference to his Tuskegee neighbors: "From the citizens of both races in my county I have been the recipient of marks of friendship. During all these years I have never received one personal indignity in word or act. Nor have I ever asked anything of black or white citizens which it was in their power to grant that I have not received." At the close of the week, after seeing and hearing everything that demonstrated the value of what Tuskegee is doing, there were many to echo the opinion of President Eliot that there should be at least one such institution as Tuskegee in each of the Southern States, and "in my judgment," said he, "the National Government, through whose action slavery was abolished, should take a hand in the establishment of these new Tuskegees. . . . Wherever throughout the country there are communities of colored people so populous that separate schools must be maintained for them, the National Government should give aid to the States that they may have competent normal schools."

.At the Convention of the Racial Student Volunteer Move-Self-Esteem ment recently held at Nashville, Tennessee, the colored delegates and the white delegates were seated separately. The arrangement occasioned no small amount of criticism. Some of the colored delegates, accepting this arrangement as an insult to their race, declined to attend the Convention. number of white delegates have interpreted it in the same way. One negro minister has written a letter calling the action of the officers of the Convention unchristian. The incident has now been made notable by an article published in the "Congregationalist" by a negro minister, to whose words we have in another instance had occasion to refer, the Rev. T. Nelson Baker, of Pittsfield, Massachusetts. He points out very clearly that to regard the separation of

the races as an insult to the negro is equivalent to an assertion that the negro is an inferior. From his article we quote the following sentences:

There is but one thing that will ever save the negroes of the South from the pity of all thoughtful people—and pity borders on contempt—and that is the growth of a feeling in the heart of the Southern negro that makes him as proud of being by himself as the Southern white man is of being by himself... It is hard to respect a person that is always whining and pouting because you do not want to sit by him. . . When the negro really feels as proud of being black as the white man does of being white, he will no longer feel humiliated by being seated by himself. . . . Booker T. Washington is just as great a man sitting apart with his mother's people as he is when he sits with his father's neonle

There is growing up among the negroes of this land a class of persons who spend their time and strength in talking and writing about their "manhood." This talk has the tendency to give one the same feeling one has in the presence of the woman who is always talking about how sacred she holds her virtue. Superiority, manhood, and virtue never speak of themselves.

Mr. Baker has no hesitation in declaring that the wrongs done the negro should be fought, but he makes it plain that he does not agree with those who put their faith in methods of fighting wrong which involve a disregard of the separation of the races:

Some would destroy the "Jim Crow car," so that white and colored can travel together; others would destroy the "Jim Crow negro," so that the so-called "Jim Crow car" would be the best car in which to travel. This is the longest way round, but it is the surest way home.

This constant protest against everything like race separation has a deeper meaning than at first sight appears. There is a class of negro leaders who in their blindness object to everything negro. They object to negro churches, and call them a great wrong against the negro; they object to negro schools, and feel that a great wrong has been done the negro child who has not been allowed to attend school with white children—and in their heart of hearts they object to the negro child.

The name negro smacks of reproach—so did the name Christian once, but to-day it is the name which is above every name. Names are what the owners of the names make them.

We commend these statements by a negro minister to those who, by protesting

against the separation of the races, are really urging the negroes to regard separation as a badge of inferiority.

The troubles which have Zion in been smoldering in John a Ferment Alexander Dowie's community for many months past last week broke out into flames. The leader of the strange religious cult which is known as the Christian Catholic Church of Zion has been an autocrat from the begin-He has displayed great skill in ning. selecting from various sources the most effective devices for impressing with a sense of his power the sort of people whom he has succeeded in gathering together. Faith healing combined with time-clock devices for recording prayers, elaborate ritual skillfully combined with the informality of revival services, great industrial schemes combined with an arrangement by which the various undertakings are vested in him personally, observances of fasts and certain forms of abstinence combined with appeals to some of the crudest passions and desires for self-indulgence, a complicated organism combined with a retention of supreme power for himself, constitute some of the methods by which he has built up a city in Illinois and has created for himself a position which combines the function of an army general, an ecelesiastical patriarch, a religious prophet, a miracle-worker, a fortune-teller, and a corporation magnate. Financial adverses seem now to be the cause of this autocrat's present difficulties. to these are his physical disability, which has shaken the faith of some of his followers in the superabundance of his power to deal with the ills of the human flesh, and the suspicions of his subordinates in office that he is inclined toward polygamy. From the contradictory reports in the daily papers this much at least appears: that he is separated from his wife and son, and that divorce proceedings have been or are about to be commenced; that the community sympathizes with the wife; that the lieutenant to whom in his temporary absence he gave a power of attorney involving complete control of the property of the

community has used this power to deed the property to a different representative of Zion; and this action has been accompanied by a communication from the new leader informing him that he has been suspended from office. What he may accomplish by his personal presence when he reaches Zion it is impossible to say. At other critical stages in his career he has succeeded in rescuing himself from very grave difficulties; but now, with his most trusted lieutenants and even his wife and his son attacking him with bitterness and determination, he is in a position the only outcome of which appears to mean either his own retirement or the disintegration of the community he has constructed. The present condition of Dowieism illustrates the fact that superstition has within itself elements which bring it to destruction.

Our readers will recall a The Case of notable letter from the Dr. Crapsey Rev. A. S. Crapsey, published in The Outlook for September 2. 1905, and the correspondence to which it led. Charges of heresy were subsequently preferred against Mr. Crapsey, who is the rector of St. Andrew's Episcopal Church in Rochester, New York. These charges are based upon a volume written by him entitled "Religion and Politics," and on a sermon preached by him last December. His accusers aver that Dr. Crapsey denies the virgin birth of Jesus, his resurrection, his miracles, and generally his divine origin and character; in a word, the supernatural in Christianity. The charges were first brought before a Committee of Investigation which decided that the evidence did not justify a presentment. The "Churchman," which is unquestionably both the ablest and the most broadly representative organ of the Episcopal Church, affirms that "to the overwhelming mass of churchmen and non-churchmen this judgment will doubtless stand as representing common justice, no matter what the decision of the present court may be." Dr. Crapsey has, however, been presented for trial by the Standing Committee of the Diocese to which his parish belongs, and the case is set down by the Bishop of Western New York, Dr. William David Walker, for trial on the 17th of this month.

®

Whether the Com-What is Fundamental mittee of Investiga-Christianity? tion and the "overwhelming mass of churchmen and nonchurchmen" or the Standing Committee are correct in their interpretation of Dr. Crapsey we shall not here consider. do this would require a careful and judicial review of his book. But, assuming for the moment that the Standing Committee are correct in their interpretation, two questions remain: Are the views attributed to Dr. Crapsey sound or unsound? If unsound, does the error disqualify him for the ministry? There are three views of Christianity entertained to-day: the first, that man is left to grope his way as best he can to the truth, and that Christianity is the best solution of the enigma of life which he has yet reached; the second, that God has appeared to a special chosen people and given to them the solution, and that Christianity is that specially revealed solution; the third, that God is and always has been man's Companion, that revelation is as universal as aspiration, that all religions are partial revealings of God to man and in man, and that Christianity is the supreme chapter in this history of perpetual revelation. The first view eliminates the supernatural, the second regards it as an episode, the third believes in it as universal. The Standing Committee attribute the first view to Dr. Crapsey; they themselves hold the second view; The Outlook, in common with an increasing number of Christians, holds the third. We are inclined to the opinion that this is also Dr. Crapsey's view, though by him not always clearly differentiated from the first. were it otherwise the question would still remain, Should he be excluded from the ministry for his error? We think The Church of Christ is not a school of philosophy, it is a reservoir of It should be large enough to welcome to its membership all who profess and call themselves Christians, and to its ministry all who, in the spirit of

Christ, are endeavoring to promote peace and good will among men. Christ has given his ministers both their mission and their equipment: "As my Father hath sent me, even so send I you. Receive ye the Holy Spirit. Whose soever sins ye remit, they are remitted unto them; whose soever sins ye retain, they are retained." Whosoever accepts this Christly mission, manifests this Christly spirit, and gives himself to this Christly task of delivering men from the pains and the bondage of sin, belongs in the Christian ministry, whatever philosophy he may hold respecting the true solution of the enigma of life.

☻

Eastman Johnson, who Eastman Johnson died at his home in New York City last week, was in his eighty-second year and was one of the patriarchs of American painting. He was born in Maine, taught himself to paint portraits, and in Washington, while still a very young man, painted portraits of John Ouincy Adams, Mrs. Madison, Emerson, Webster, Longfellow, Hawthorne, and many other prominent Americans. In 1849 he became the pupil of Leutze in Düsseldorf, and subsequently studied in Italy and Holland, spending four years in the latter country. On his return to Washington he opened a studio in Boston; his interest in Indians and his desire to study them for painting purposes led him to the shores of Lake Superior; in 1857 he became one of the group of artists and writing men who did their work in the old University building on Washington Square, New York. He became known early both as a portrait painter and as a painter of characteristic types—what the French call a "genre" painter. "The Old Kentucky Home "captivated the public imagination in 1858; other pictures which won their way to great popularity were "The Barefoot Boy," "Fiddling His Way," "The Old Stage-Coach," "A Sunday Morning," and "The Pension Agent." Among prominent men who sat for him in later years were Presidents Arthur, Cleveland, and Harrison, Presidents McCosh, Porter, and White, Bishop Potter, and a long line of

women of social prominence. Eastman Johnson was not in any sense of the word a great painter, but he was a very painstaking and faithful interpreter of life and character, both in his portrait and genre work. His technique was good without being brilliant, and he had an opportunity of recording the history of his time in a series of portraits which are likely to give his work hereafter something of the historical interest of that of Copley and Stuart. Like them, he came at a fortunate period, and he has caught and transmitted to posterity the features and in a certain sense the standards and ideals of a generation educated in common traditions. more sincere, straightforward artist has lived in America, nor one more devoted to his craft; and the great respect and honor in which he was held were recognition alike of his character and his talent. He was one of the very few survivors of the older generation of artists whose work was stamped by great simplicity, directness, and thoroughness of technique rather than the refinement and subtlety of the later methods, and lacking the atmosphere and imagination of the best work of the more recent men.

Mr. J. Fred Wolle, who An Orchestra in created the Bach Festhe Open Air tivals at Bethlehem. Pennsylvania, and whose extraordinary ability to impart to others his own musical sensitiveness and intelligence gave to those festivals great distinction, has been performing this year a similar, yet different, service on the Pacific coast. He has established a series of orchestral concerts in the open air. These have been held in the Greek Theater, belonging to the University of California, at Berkeley. There, under the Californian sky, with the breeze blowing freely upon the audience and sounding in the branches of the trees, while the songs of the birds could be heard in the intermissions, modern orchestral music has been given under conditions resembling those under which the ancient Greek dramas were presented. At the second of these concerts, in March, there were present some seven thousand persons.

Although the orchestra which has been formed is not a large one—about sixty performers—it has received high praise. and has amply justified its existence. Mr. Wolle directs the performers in the open air in California, as he did in the Moravian Church at Bethlehem, without a baton. The whole of his lithe, sensitive, nervous figure he utilizes in playing upon the body of musicians before him. In Bethlehem he devoted himself to interpreting Bach. We question whether there is any other musical leader in this country who combines, as does Mr. Wolle, a minute technical knowledge of the intricate works of Bach with a profound appreciation of their emotional and, if we may be permitted the term, romantic-character. This union of musicianly knowledge with artistic sensibility is now exhibited in Mr. Wolle's interpretation of other masters. His power to arouse musical enthusiasm has again been demonstrated by the response which the Berkeley concerts have evoked. The undertaking has no commercial object. Its high and disinterested character is secured by the fact that it is under the auspices of the University of California. The University is fortunate in having Mr. Wolle in its chair of Mu-President Wheeler announced at the close of the first concert that "a permanent orchestra is assured to the University."

It is encouraging to note The Anti-Smoke the increasing interest Campaign in the work of the Anti-Smoke League and the increasing activity of the authorities in suppressing the smoke nuisance. The city of New York is almost free from black smoke, but all sorts of craft on both rivers still pour forth clouds that darken the sky and contribute murkiness to the landscape, while along the Long Island and New Jersey shores great clouds of smoke rise day by day. It is a matter of prime importance, however, that so far the Borough of New York has been successful in its fight, and that it still rejoices in skies which, for the greater part of the year, are as blue as those of Italy. The Department of Health has done good work in this direction; it is clothed

with ample powers, and what it needs is the support of a vigorous and persistent public opinion. The fight for pure air and clear skies is not waged against any kind of fuel; it is a fight to secure certain results essential to health and to beauty. Any kind of fuel may be used; all that the law requires is that it shall be used in such a way as to leave air and sky uncontaminated and unobscured. Beauty is a prime element in the attractiveness of great cities, an asset of the utmost value; but it is not for beauty alone that the Anti-Smoke League is contending; it is for utility as well. smoke-laden air involves an enormous loss to manufacturers and dealers in fine goods of every sort; it greatly adds to the expense of cleanliness for people of all degrees of wealth or poverty, and it is undoubtedly an element of irritation if not of disease. New York would be very short-sighted if it were to permit, by its carelessness and indifference, a nuisance to grow up against which Western cities are organizing and conducting extensive and expensive campaigns. Every citizen ought to be awake to the immense value of the air and sky of the metropolis; they are a part of the common possession of men and women of every class, and the whole city ought to be organized for their protection.

6

As an outcome of the yellow Inter-State fever epidemic in New Or-Quarantine leans, and the conference of representatives of Southern States to promote more effective quarantine measures, a bill which puts under the control of the Secretary of the Treasury all quarantine stations, grounds, and anchorages, empowers him, under certain conditions, to establish quarantine stations, and provides penalties for any interference or obstruction with inter-State transportation of passengers, freight, and baggage properly passed upon by the Public Health and Marine Hospital Service, has been passed by the House of Representatives by an overwhelming vote. In spite of the opposition of certain Representatives from Southern States on the ground that Federal control of quarantine is an interference with

the rights of the States, the movement for National supervision has proved so far to be irresistible. The unseemliness of the squabbles between State governments on the subject of quarantine during the yellow fever epidemic of last summer, and the injury done by the attempt of local or State bodies to deal with a disease which had no regard for State or local boundaries, have supplied so complete an answer to all objections that even so vigorous a defender of the rights of the States as Mr. Williams, of Mississippi, has characterized this bill as a public necessity. It is to be hoped that the bill will meet in the Senate as prompt affirmative action as it found in the House.

Niagara and the Nation

The people of America have been swiftly coming, of late, to understand that they are the real owners of Niagara Falls, and that it is their duty, as well as their high privilege, to see that this scenic wonder is preserved to posterity undiminished in glory. The fact that it is possible to transmute its beauty into certain hundreds of thousands of horsepower for the enrichment of a few is widely accounted as of small consequence compared with the Falls themselves, which are now gravely jeopardized, and will in all probability be destroyed unless the people promptly claim their own. If New York City, with three million people, can afford the luxury of Central Park, which is estimated to represent a value of two hundred and twenty-five million dollars, the people of the United States and Canada cannot afford to count too closely the money cost of stopping now the work of commercializing Niagara, which has made such alarming progress.

The Outlook presented briefly last week the conclusions of the American section of the International Waterways Commission, and the recommendation to Congress that these conclusions be enacted into law pending an international agreement for making the arrangement permanent. Careful study of this report has led to a widespread convic-

tion that these recommendations fall far short of the necessities of the situation, and that to concede all that the Commission proposes will constitute a serious menace to the beauty of the Falls. Acting on this conviction, representatives of the American Civic Association and the Merchants' Association of New York presented to the President of the United States and to the Committee on Rivers and Harbors of the House of Representatives, a few days since, considerations which led to the recommendation of immediate action arresting at substantially the present point all development involving additional diversion of Niagara water.

The facts which it is important for the people of this country to bear in mind in considering this matter may be restated as follows:

The total quantity of water to be taken from the river by private works now authorized is 60,900 cubic feet per second, to which must be added diversions of 12,200 feet for the Chicago Drainage Canal, the Erie Canal, and the Welland Canal, amounting to a grand total of 73,100 feet. This amount is distributed as follows:

Cu	bic feet.
Niagara Falls Hydraulic Power and	
Manufacturing Company	9,500
Niagara Falls Power Company	17,200
Canadian Niagara Power Company	9,500
Ontario Power Company, not includ-	
ing Welland River Development	12,000
Electrical Development Company	11,200
Niagara Falls Park Railway Company	1,500
Chicago Drainage Canal	10,000
Welland Canal or its tenants	1,800
Erie Canal or its tenants	400
Grand total	73,100

This grand total is thirty-three per cent. of the maximum and forty per cent. of the minimum amount of water passing over Niagara Falls.

The quantity of water thus to be diverted is more than double the quantity which now passes over the American Fall, and is equivalent to the entire discharge of Lake Superior through the Sault Ste. Marie. The Commission says: "That this will in general have an injurious effect upon the Falls seems self-evident."

The amount of water at the present

time actually diverted from the Falls is but 17,800 cubic feet a second, which diversion "has had," in the language of the Commission, "an appreciable effect upon the Falls."

The recommendation of the Commission, transmitted to Congress, is that the Secretary of War be authorized to grant permits for the diversion of 28,500 feet a second and no more, as follows:

Cu	bıc feet.
Niagara Falls Hydraulic Power and	
Manufacturing Company	9,500
Niagara Falls Power Company	
Erie Canal or its tenants (in addition	,
to lock service)	400
Chicago Drainage Canal	10,000
This provision is predicated upon	
diam aatiam waatmistima the diamen	:

dian action restricting the diversion of water to a total of 36,000 feet, as follows:

Canadian Niagara Power Company	9,500
Ontario Power Company	12,000
Electrical Development Company	11,200
Niagara Falls Park Railway Company	1,50^
Welland Canal or its tenants (in addi-	· <u>-</u> '
tion to lock service)	1,800
•	•

That is to say, the Commission recommends that legislative action be taken, concurrently with Canadian action, for diverting from Niagara Falls sixty-four thousand five hundred cubic feet of water per second, or nearly four times as much as is now diverted, notwithstanding the fact that the present diversion "has had an appreciable effect upon the Falls."

It seems perfectly clear to The Outlook that the recommendation of the Commission ought not to be adopted, but that the Secretary of War should be directed by the President to interrupt at substantially the present point all developments involving additional diversion; that Congress should enact at once a law to the same effect; and that the Secretary of State should be advised to bring to the attention of the Government of Great Britain this action, with a request for similar action on its part pending a final international adjustment of the whole question.

There is good authority for saying that this in general expresses the present views of the President and of those in Congress who will be most influential in dealing with the question.

What is important just now is that both the President and Congress should

be assured that the people of the whole country are behind them in this effort to save Niagara Falls for all the people.

The Searchlight: Use and Abuse

The past year will probably be known in the future as the year of investigations. The searchlight of inquiry has been turned in various directions, and the revelations of financial character, management, and condition which have come to light have held public attention almost to the exclusion of other matters of interest. A considerable part of the public have reached a state of mind which is not satisfied unless the searchlight, like that which flashes from some of the river steamboats, touching now a house, now a boat, now a group of people, now a bit of wood on one side or the other of the river, is continually bringing new objects within view and lifting the veil of privacy from men and enterprises in all parts of the country. There is danger that the searchlight may be overworked, as the phrase runs; that the use of investigation may be diverted from its proper channels; that what ought to be an instrument for moral reform and ethical reorganization may be discredited by the improper purposes to which it is put and the over-emphasis laid upon its use. The searchlight to discover the position of a ship and the possible dangers that surround it is of immense value; the searchlight used to amuse a crowd of passengers on the deck of a steamer on a pleasant summer evening may be diverting, but it can hardly be regarded as aid to safety in making the voyage.

The use of investigation to uncover conditions in order that evil things may be remedied, wrong things set right, inefficient methods discarded, evil-doers punished, has been admirably illustrated by the method and spirit of the Armstrong Committee, the members of which, indifferent alike to the antagonism of great interests and to popular clamor, relentlessly but dispassionately went, as far as time permitted, to the bottom of

the management of the life insurance business in this country, not for the purpose of supplying sensational newspapers with material for scare-lines, but for the purpose of laying the foundation for intelligent legislation. It was admirably illustrated a generation ago in New York City when the frauds perpetrated by the members of the Tweed Ring were traced step by step and brought to light. that historic instance, as in the work of the Armstrong Committee, the searchlight was turned on for the purpose of discovering how the interests of the public were administered; and in both cases the investigation laid the basis for reorganization and reformation. In order to strike at an abuse its nature must be understood; to reorganize a bad system its defects must be brought to light; to set an ethical revolution in motion the offenses against righteousness must be understood. Investigation of this kind cannot be too searching and thorough.

There is danger, however, that a habit of using the searchlight of investigation may be formed, and that method which ought to be used with the greatest discretion and for the highest purposes may lose its force and cease to be one of the most efficient instruments of re-Serious investigation for serious ends under intelligent direction, indifferent alike to the antagonism of great interests and to the clamor of the public, is of the very highest importance; but investigation for the purpose of securing sensational results to divert and amuse the public is a travesty of an invaluable method, a waste of a force for righteousness, and in the last degree demoral-If moral reformation is to be brought about, and the public and private business of the public placed on a sound basis, there must be substantial faith in general integrity, and a wise use of criticism and condemnation. Nothing could defeat the hopes of reformers more completely than to breed general distrust, the habit of speaking of all organizations and of all men of affairs cynically, the dissemination of the idea that everything and everybody is corrupt.

The American people are proverbially volatile. They lack, as compared with the English, for instance, the power

of concentration and of holding their attention on one movement until it has been carried to its end and a piece of constructive work entirely finished. The Englishman has the capacity of getting angry and storing up righteous anger as a motive power until the abuse against which he protests has been removed. The American gets angry and in a day or two either forgets or jokes about the offense which aroused his indignation. It is in the last degree important that the feeling of indignation, the sense of moral outrage, which have come as the result of the revelation of extravagance in the use of other people's money, the betrayal of trusts by men in whom everybody confided, the moral slovenliness and the cheap and shabby way of looking at life taken by men of high position, shall be converted into motive power, and that the righteous indignation of a whole people should vent itself, not in indiscriminate condemnation, but in clear, wise, curative legislation.

A period of investigation ought always to be prefatory to a period of constructive legislation and ethical reorganization. In the life insurance field investigation is not complete, but the period of investigation has already given place to the period of reorganization. It is not to tear down for the sake of entertaining a crowd of idlers, but to tear down in order to rebuild on true foundations and along sound lines of construction, that Americans must bend their energies.

Tuskegee

In 1880 the Legislature of Alabama established a Tuskegee State Normal School for colored people, appropriating for it two thousand dollars. It asked Hampton Institute to recommend a principal, and on the Institute's recommendation Booker T. Washington, a then wholly unknown colored young man of twenty-one years of age, came to Tuskegee to open the school. Last week Tuskegee Institute celebrated its quarter-centennial. A special train from the North and local trains from the South brought to Tuskegee probably not less than two hundred distinguished visitors. They came

to an institution possessing 2,300 acres of land, upwards of ninety buildings, over 1,200 pupils, over 150 teachers, an aggregate endowment, including its real estate, over \$2,000,000 in value, and involving a current expenditure of about \$180,000.

Dollars are, however, a wholly inadequate measure of the value of such an institution. From its gates six thousand men and women have gone out to carry with them a leaven of intelligent industry throughout the South, and some of them into distant lands. Nearly five hundred of its pupils have been trained in its Bible training school for direct Christian Upwards of two thousand are engaged in teaching. Out of their efforts have sprung sixteen incorporated schools animated by its spirit and extending its work; how many unincorporated schools we do not know. It is not known that a single graduate has ever been convicted of a crime. Of the anniversary exercises we give a brief account on another page. Doubtless interested readers can secure fuller accounts by addressing Mr. E. Scott, Mr. Washington's private secretary at Tuskegee, and making a small remittance to pay the cost of the report which will be published. Here we briefly interpret Tuskegee Normal and Industrial Institute as an object-lesson.

It is of course first of all a monument to the genius of its founder. Born a slave, receiving at Hampton not more than the equivalent of a high school education, devoting himself with singleness of purpose to the education of his race, inspired by faith in their capacity, proud to be known as a negro and identifying himself with the negroes, believing from the very beginning that it was both possible and indispensable to maintain the friendship of the whites among whom their lot was cast, believing, too, that the only way to secure respect is to deserve it, and that the first condition of deserving it is to be self-respecting and self-supporting, Mr. Washington has never allowed himself to be swerved from his purpose by flattery nor hindered in it by insults-and he has been the recipient of both flattery and insult from both whites and negroes. Greater educators than Dr. Washington there may

have been; but it would not be easy to find in the history of any race the story of a life more Christlike in its patient devotion to an unselfish cause than his has been.

Nor is this Institute less a witness to the possibilities of the Afro-American. The possibilities of a race are always measured, not by their averages, but by their leaders. We go not to the discouraged inhabitants of our deserted hill towns, not to the slums of our overcrowded cities, not to the lawless populations of our pioneer communities, to ascertain of what the Anglo Saxon is capable. We ask our schools and colleges for their graduates, our towns and cities for the best exemplars of their enterprise, our rural populations for their prosperous farmers; or we look to exceptional geniuses like Jefferson or Lincoln, like Fulton or Morse, like Lowell or Hawthorne, like Brooks or Beecher. Dr. Washington is a conclusive answer to the ignorant assertion that the negro is incapable of great things. Nor does Dr. Washington stand alone. No great leader ever stands alone. Dr. Washington has no more made Tuskegee than Dr. Eliot has made Harvard. Harvard could not be were there not scholars able to receive what Harvard has to give; Tuskegee could not be were there not negro pupils able to realize the vision which Dr. Washington was the first to see.

Nor is Tuskegee less a monument to the white people of the South. It was called into existence by the white people of the South. It received its first appropriation from a Legislature representing the white people of the State. It has had official and financial indorsement every succeeding year from the same quarter. Southern bishops, judges, legislators, and citizens eminent in private life have vied with each other in doing it honor and giving to it their So hearty, so unanimous, has been this support that Dr. Washington was able to say that he had never asked anything of his white neighbors which they had not cordially granted to him if it was in their power to do so.

It appears to us that Tuskegee is equally a testimony to the value of

democratic institutions and the democratic spirit. Dr. Eliot in his address said that Tuskegee had acquired more in the first twenty-five years of its existence than Harvard had acquired in its first two hundred years. It is true that during the first two hundred years of Harvard the country was poor, during the first twenty-five years of Tuskegee the country has been rich; during the first two hundred years of Harvard popular education was to some extent an experiment, during the first twenty-five years of Tuskegee it has been a National enthusiasm; that the education of Harvard for the first two hundred years was almost exclusively classical and literary, while the education at Tuskegee has been primarily industrial and commercial. But, making all allowances for these important differences, it still remains true that never before in the educational history of mankind have twenty-five years shown such phenomenal growth in any single institution, and that nowhere else except in America would such a growth have been possible. For the gifts of the State of Alabama have been chiefly valuable as a token of her good will; in the main, Tuskegee is the product of private benevolence. It is an educational edifice built up by spontaneous gifts, not even aided by subsidiary denominational or sectional or race pride. it is a living testimony to the value which a democratic country and a commercial age put upon education—that is, upon character. It is not just to call such an age and such a country sordid.

Finally, Tuskegee is a conclusive reply to those who have thought to exalt classical learning by disparaging industrial training. The men and women whom it has graduated and the work which they are doing, the more than a score of schools, large and small, which they have founded, and the leaven of intelligence which because of them is spreading through the community, constitute an unanswerable witness to the truth that the Christian spirit is not confined to ecclesiastical organizations, and that education is something more than reading, writing, and arithmetic, even though the reading be of Latin and Greek, the writing of essays, stories, and poems, and

the arithmetic be carried forward into logarithms and conic sections. Education is the development of the whole man; and practical education in the mechanic arts, if it fits the pupil for a life of useful and happy service, is higher than education in what are called the classics if it leaves him impotent for service and discontented with his life.

Dr. Washington asked last week for an endowment of six or seven millionsthat is, he wishes to treble the present endowment. His request is reasonable. Without any official position, he has yet become the superintendent of education for his race in the United States. More than that, by his ministry he has broad ened the public conception of education and done probably more than any other one man to give impulse to that industrial education which is to-day the greatest need of both races and both sections. The service which his educational campaigns have rendered to the North has been great; but it is no longer necessary, and it is time that he was relieved from continuing it. He could render the best future service to his country were he free to improve the quality of Tuskegee's academic work, to broaden still further its curriculum, both literary and industrial, and, above all, to push forward its extension work until in every community in at least the Gulf States there is a school guided by the same purpose and animated by the same spirit.

He Is Risen

Twenty-five years ago, when the movement of reaction against the easily accepted faiths of the past set in motion by the more exact and exacting methods of scientific thought was at its height, the story of the Resurrection faded for many into a noble tradition; one of those beautiful visions which have always hung like clouds about the horizon of the sad, stern world of actual life. A few of the thoughtless, who had never felt the tragedy of a life unlighted by the great hope of immortality, sneered; the cynical, who "knew the price of everything and the value of nothing," scoffed; but

to many of those who felt the intellectual influence of the time too deeply to resist the outgoing of the tide of faith, it brought passionate sorrow or despair:

"While we believed, on earth He went
And open stood His grave;
Men called from chamber, church, and tent,
And Christ was by to save.
Now He is dead. Far hence He lies
In the lone Syrian town,
And on His grave with shining eyes
The Syrian stars look down."

But the stone rolled back against the sepulcher with jeers or sighs, with cynical derision or with a sad sincerity of conviction, would not rest where human hands, working against human hopes, had placed it. Roman centurions could not keep the Christ among the dead; and modern doubt and skepticism have found themselves as powerless against that invincible life. The tomb is empty, the grave-clothes are laid aside, the stone has been rolled away, the Christ lives!

The question of the manner of his appearance and of the form he wore is immaterial; the glorious fact remains that he who banished sin and pain and care and sorrow overcame death also; that he who walked with men along the road of life and shared their lot walked also with them into the valley of the shadow of death and emerged again into the light unharmed and serene. Henceforth death has no sting of despair and no victory over life; both are incidents in an endless life.

The Christ cannot be kept within the bounds of mortality by any theory or explanation which the most learned or subtle can formulate; he stands outside every endeavor to account for his unique personality and career; theory after theory has been advanced and abandoned; no interpretation can bind him to the earth and hold him within the limits of its laws as men understand them. He has made no new manifestation of his power; he has added no new chapter to the brief and simple biography made by his immediate followers; but his critics themselves have become aware that he stands outside the circle of their arguments and proofs, and is still the one personality through whom the will of God shines with undimmed light and in whose life and death the supremacy of the immortal disclosed itself moment by moment over the mortal.

Science speaks of him to-day in another language; for the universe which it studies with such self-denying patience and noble integrity of aim is no longer the hard, material universe of twenty-five years ago. It has grown more marvelous, its laws have taken a vaster sweep, its forces approach every year more closely the confines of the spiritual, it grows day by day more and more what men used to call a miracle; and every decade it makes more room for the Christ, sheds a friendlier light upon his career, becomes more hospitable in its attitude toward him. The stone has been rolled back, not only from his sepulcher, but from the deeper mysteries of a world which once seemed the burying-ground of a race whose dreams mocked them with futile visions of a divine meaning in their fate.

There are few facts in ancient history which rest on a surer foundation of documentary evidence than the reappearance of the Christ after his body was committed to the tomb. There is no event, among all the events in this brief section of life which we call time, so overwhelmingly proved by the most convincing of witnesses: the deep-going and final change of mind and character in those who were in personal contact with him. When the stone was rolled against the sepulcher, the disciples were scattered like helpless sheep; one openly denied him, others fled from the scene of his agony, and those that remained were silent or heartbroken; and then, straightway, as if some tremendous revelation had come to them with a force which silenced all questioning forever, these timid, doubting, cowardly men became tireless teachers, eloquent witnesses, heroes and martyrs; instead of hiding their faith, they wore it like a shining robe, and went their several ways to death with songs of rejoicing. And one of the greatest of the company of men of genius, coming a little later not only to deride but to persecute him, was overtaken on the way by a proof so overwhelming that the fanatical hater became the greatest of the witnesses. and went about the world rejoicing in

all trial and steadfast in all suffering, that he might declare everywhere, "He is risen from the dead." And there remains also the long, unbroken tradition handed down from generation to generation, and incorporated to-day in organized Christendom; for the Church everywhere, by whatever name it is called, and all civilization that is Christian, has as its one characteristic message and central truth, "He is risen, He is not here."

The resurrection was not a singular and detached fact in the life of the Christ; it was only an incident. To men it was a demonstration of such tremendous significance that it seemed almost unbelievable; to the great invisible company who saw him from the spiritual side it was an incident in an unbroken Life.

It was predicted, however, from the hour when he lay in his mother's arms and angels sang his cradle song; it became clear in the loneliness of the wilderness, when the meaning and the work of his career broke like the dawning of day on the consciousness of the Christ; it gathered force and became visible in every word of certainty, every deed of love, every flowing of virtue from his garments, every outgoing of vitality, during those three years that ran like an oasis through the desert of the world; the most fertile, fruitful, and vital years ever recorded in the history of the race.

Beginning in earliest childhood, the stream of life steadily deepened and widened in him until it became a flood that swept all before it, obliterating the ancient boundaries set by death to human life and flowing with the silent majesty of irresistible power beyond the sight of In time the immortal spoke and acted hour by hour; through the Christ's mortality the immortal revealed itself day by day; in him the incredible became the solid fact, not when he rose from the dead, but when, in thought, word, and deed, he made men understand that they are the sons of God, made in his image and partaking his life. From the manger he was immortal because he was the Life; and his resurrection brought immortality to light and set it like an unquenchable torch in the vast buryingground of the world.

THE BOSTON FRANCHISE CONTEST

BY ROBERT A. WOODS AND JOSEPH B. EASTMAN

The reader of this article will be interested to compare it with that by Mr. George C. Sikes on "Chicago's Struggle for Freedom from Traction Rule," published in The Outlook for March 31. Taken together, these articles show in a striking way that the same pressing municipal problems are in our day to be found, though with varied phases, in all our great cities East and West, and that citizens everywhere must act with harmony and promptness if public rights are to be upheld.—The Editors.

N one side a great corporation, backed by wealth, newspapers, politicians, and powerful financial interests; on the other, a handful of resourceful citizens creating public opinion and concentrating it upon the public interests; a contest extending over three years; final victory with the citizens in every detail. That is the most significant thing in the recent political history of Boston.

The subway in Boston means more than most subways. It is the only underground system in the world which is directly connected with both the surface and the elevated systems. business section of Boston is a contracted space surrounded on three sides by sea and river, and partially blocked on the fourth by Beacon Hill and the Common. Its streets are narrow and crooked. and entrance to it must be made for the most part by two parallel thoroughfares-Tremont and Washington Streets. rush hours the dense mass of humanity overflows on the street itself, and the coming of the trolley-cars made the situation impossible. Long, snake-like lines of creeping cars left no room for struggling teams, and endangered the lives of foot passengers. Relief had to be found, and it came in the shape of the subway under Tremont Street—that is, a new street was laid out under ground, devoted to the exclusive use of trolley-cars and elevated trains, and the old street on the surface was cleared for its original purpose—travel by horse and foot. present time another underground thoroughfare is being constructed under Washington Street, which will still further ease the situation. As a result of all this, the subways have become the one essential factor in the transportation system of the city. They gather up the trolley lines extending for miles into the suburbs, and the elevated trains draining the vast districts beyond Charlestown and Roxbury, and concentrate in a small channel well-nigh the entire car service. They provide the one path for surface and elevated cars through the heart of the city. Whoever holds the subways is master of the transportation situation in Boston.

When the first subway was built, it was an experiment. Croakers predicted that its cool, damp depths would breed colds and pneumonia, that the public would respectfully decline to use it. The West End Street Railway Company, which owned most of the surface lines at that time, was given the chance to build and own this experiment, but very promptly and decisively refused. The city was obliged to build and own the subway itself; but the experiment completed was a different matter. There was then no question as to its success; and, moreover, the tracks had been ordered off Tremont Street, under which the main section ran. With no alternative in view, the West End Company agreed to lease the new subway from the

The Company was not only willing and ready to take a lease, but it emphatically insisted upon a tenure of fifty years, the full limit allowed by law, so radically had its point of view shifted. A few public-spirited men, however, began to realize the simple but essential

Digitized by Google

principles involved in the situation. The subway was nothing more nor less than a continuation of the street, under the surface instead of above, to be sure, and used by one kind of traffic instead of many, but still a street and to be owned and controlled by the city like other streets. Its creation was of very particular benefit to the street railway corporation, which could afford to pay, and in justice ought to pay, adequate compensation for its use. Additional inventions of transit facilities might make it even more valuable property in the future, and this generation could not in good faith enter into any binding contracts which might tie the hands of future generations and prevent them from taking full advantage of their improved situation.

From this point of view, fifty years was far too long a tenure. The Legislature listened to the men who said so, and found their arguments convincing; for the West End Company had not prepared itself at that time to combat logic with more potent arguments. The resulting lease was the direct and substantial basis of all the subsequent victories over the corporation. It provided for a twenty-year tenure, with a rental of four and seven-eighths per cent. on the cost of construction as compensation—enough to pay the interest on the city's subway debt and provide a sinking fund which will give the city a highly remunerative piece of property, debt free, in about thirty-three years-but in no event was the rental to be less than five cents for every passage of a car through the subway, an important declaration of the broad principle of a toll system and a rental increasing with a growing business.

The formation of the Boston Elevated Railway Company and the facts attendant upon it were responsible for the main contest between the people and the corporation. It came about in this way: The West End Company was making too much money. To tempt a suspicious public with too great a show of declared dividends was distinctly dangerous; but a big New York financier saw the way out of the difficulty. He allied himself with a group of men in Boston, keen and shrewd and not too

scrupulous as to ways and means—men backed by an alliance of great banks and trust companies—the same alliance which has stood sponsor to most of the public service corporations in Massachusetts, and which at that time had a commanding influence with Boston newspapers, politicians, and financial circles. His plan was this: Form a company ostensibly to build elevated roads in Boston, lease the West End, guarantee a comfortable dividend on its stock, and let the rest of the earnings pay dividends on the stock of the new company. proof of this is clear and direct. It is found in the fact that the Boston Elevated stock paid four and a half per cent. dividends before ever a mile of its elevated track was in operation.

The execution of the plan was easy. Some of the West End directors fought bitterly against the New York influence creeping into the Boston transportation field, but the majority succumbed to the too tempting possibilities of the lease. With the cleverest legislative counsel and lobbyists in the State, and no public sentiment crystallized as yet in opposition, the Legislature readily yielded. From it they secured most sweeping and valuable amendments to an old and impracticable charter for elevated railways in Boston. Street railway locations in Massachusetts, with this solitary exception, are revocable at the will of the State or municipal authorities; but the complete set of locations for elevated railways which these amendments granted them were, if built upon, perpetual and irrevocable absolutely. That was the vital point in the highly generous concessions made by the Legislature.

The charter of the Elevated having been secured in a moment of public inertia, the fight between the people and the corporation centered on this point: to counteract the effect of this extraordinary grant to the Elevated Company and to keep the municipality in complete, ready, and effective control of the public utility of transportation. The subway was the vulnerable point in the armor of the Company. It was the only method of connecting the two ends of the elevated system—extending into Charlestown on the north and into Roxbury on

the south—through the heart of the city. With the first subway in municipal control and leased on short and reasonable terms, the city was master of the situation; but in the suggestion for a new parallel subway under Washington Street the corporation saw its opportunity. That could supply the connecting link. If it could in some way secure undisputed and permanent possession of this new underground thoroughfare, its control would be complete. The Elevated Company would be self-sufficient, with all the essentials at hand, and in a position to dictate terms.

If the Company had set out quietly and discreetly to seek this desired end, there is no knowing what a dozing public might not have allowed. But at the outset it made a blunder which proved fatal. Misled, perhaps, by the ease with which its plans had so far been carried through, it now made a move which stung certain citizens into action—the same band of men who stayed awake henceforth and persistently confronted the corporation through all its maneuvers until its final When the subway was completed, the tracks had been ordered off Tremont Street. The tracks and wires were removed, but, with an impertinent confidence in the forces at its command, the Company still allowed the poles to remain. In 1899 the Company ingenuously asked the Legislature for power to replace these same tracks. The excuse was that public convenience required the change. In reality, such a move would have brought back the tedious blockades and would have defeated the whole purpose of the subway. More than that, it would have made that subway no longer essential to the Company. That was the subtle underlying motive.

A majority of the legislators, as usual, bent pliantly to the wishes of their favorite corporation, but Governor Wolcott was induced to force a referendum on the measure. That last resort was granted by a small margin, and the men who fought for it and won their fight dealt the death-blow to the ambitions of the Elevated Company then and there, little as they realized it. The newspapers, almost as a body, were lined up against them, as well as the solid city machine;

but they were men who were confident that the voters of the city could tell the difference between a good business proposition and a bad one when the facts were presented to them clearly and simply. They were not blind enthusiasts. but successful business and professional men, and they organized their campaign on business principles. All the resources of advertising, personal literature, circulars at times printed in New York to avoid treachery, public meetings, and labor union influence, were used copiously and persistently; but the climax came when the men in charge of the movement made a bona-fide offer to pay the city \$50,000 a year for the privilege of maintaining tracks on Tremont Street-the same privilege which the Company wanted as a gift-with the additional guaranty of three-cent fares. an argument which a blind man could see, and there was no answer to it; the people saw its force, and responded in their votes. When all the returns were in and the votes counted, it was found that, notwithstanding the newspapers, notwithstanding the solid influence of the ward bosses, the sense of the people could be relied on. The Company's proposition was snowed under by a vote of 51,585 to 26,354. That very night the Elevated Company set a gang of men removing the offensive poles on Tremont Street. The shadow of that referendum vote hung over them in all their future fights, warned them back from extortionate demands, and inspired the people to alertness and confidence.

The next year the Washington Street subway was broached. There was no doubt as to the popular demand for its The old subway was overconstruction. crowded, and Washington Street was congested beyond endurance. An organization called the Citizens' Association introduced a bill in the Legislature providing for a new subway to be built by the city and leased on the same terms with the existing one. The elevated road began its campaign immediately. The officials of the Company quietly conferred with the members of the Association. "Let the city build this subway," they said, "and it will saddle itself with a burdensome property which no

one will rent. Circumstances compelled us to lease the Tremont Street subway; but now we have our connecting link and our hands cannot be forced; we cannot afford to and will not lease any more subways. Still, the city needs another, and we are willing to help the people out. We will agree to build the subway ourselves. We shall own it forever; but the municipality may, if it wishes, have a three years' option, thirty years after its completion, to buy it at cost; and we shall at the same time agree to take an extension of the Tremont Street subway lease to 1937." The members of the Citizens' Association were not fighters, but men of the ultra-conservative type. They accepted these arguments at face value, and substituted for their first attempt a bill in line with these suggestions. The new bill the Elevated Company promptly and cheerfully adopted as its foster-child.

The listless public was duly impressed with the substitute bill. The majority wanted the subway and were indifferent as to how it was to be obtained. A few. out of their past experience, had more foresight. The creation of the new subway would be worth thousands of dollars to the Elevated Company. It could afford to and would pay good rental, if driven to it. Moreover, what excuse could there be for weakly surrendering the one controlling factor in the transportation situation? The issue was plain, and they resolved to fight for it. proceeded to organize under the name of the Public Franchise League.

The men who comprised this League were the same men who had been opposing the Elevated Company from the time when the first subway was built. They were for the most part business and professional men of standing in the community, and of ability equal to that of the men they opposed. Among them were Louis D. Brandeis, one of the acknowledged leaders of the Boston bar, who at all critical points acted as unpaid counsel for the League; Edward A. Filene, head of a large and growing retail business; Laurence Minot, managing trustee for large real estate interests; B. F. Keith, proprietor of Keith's circuit of theaters; Dr. Morton Prince,

distinguished specialist, with a strong inheritance of public spirit from his father, a former Mayor of the city; George B. Upham and Edward R. Warren, who became interested in connection with their important and successful efforts to preserve the beauty of Boston Common; James R. Carter and Andrew G. Webster, two of the most prominent leaders in the commercial organizations of the city; Robert Treat Paine, Ir., former candidate for the Governorship of the State; Charles M. Cox, of the Chamber of Commerce; and Edward A. Adler, for several years Secretary of the League. The League was also in close touch with settlement workers. and through them with the trade unionists.

At the outset its members stood alone, but these men had beaten the Elevated once, and were confident that they could do it again. First of all, they put their case before the united commercial organizations of the city, and won them over. Thereafter they had behind them the name and influence of the Associated Board of Trade, and in the name of that organization a bill was introduced in the Legislature providing for the construction of the Washington Street subway by the city, with a lease on the same terms as the former one.

But the Mayor was a stumbling-block. He was a Republican Mayor in a Democratic city, anxious to make a striking first year's record by curbing the enormous debt of the city. Naturally, he looked askance at the proposed increase for the construction of the subway. Here was an opportunity for a strategic move, and the League seized it. Mayor Hart's opposition lay the chance for an impressive demonstration in force in full view of the people. The Mayor granted a hearing. The members of the League saw men personally, argued with them, and on the morning of the hearing sent them all special delivery letters. Each fancied that the success of the occasion depended upon him alone, and the Mayor's office was packed to the doors, not with casual onlookers, but with representative men of the city, whose names meant something, all strenuously opposed to the plans of the Elevated Company. At last Boston was awake; thoughtful citizens were alive to the meaning of the situation, in fighting trim, and ready for war. The people saw it, and the Company saw it.

But the Mayor was obdurate, for his political necessities ran parallel with his spirit of short-range Yankee thrift. The time had come to follow up the demonstration by a quick, hard attack on the weak point in the Company's defenses its blustering defiance of the city. The Elevated had loudly proclaimed that it would never lease the tunnel on the same terms with the old one; but perhaps there were those willing to step into the opportunity and take quick advantage The Committee on Metropolitan Affairs, which had the bills under consideration, received the personal pledges of eight well-known business men that a corporation with a paid-in capital of at least \$1,000,000 would be organized to take over the new subway at a rental of 4 7-8 on cost in case the Elevated Company failed to take advantage of its option. Philadelphia brazenly overlooked John Wanamaker's offer to pay millions of dollars for public franchises and gave them away for nothing; but Massachusetts politicians have never yet approached the level of degradation where it is possible to disregard cold, staring The bills went over to the next cash. year.

The winter of 1901 opened with the opposing forces apparently in statu quo. The Elevated Railroad, through the agency of the unsuspicious Citizens' Association, again presented its bill, and the Public Franchise League, in the name of the Associated Board of Trade, presented its counter-plan. It seemed that the old fight was to be waged over the same ground, with every inch bitterly contested. But the Elevated had been outflanked, and its intrenchments were untenable. Apparently fighting along the same lines as the year before, in reality the Elevated people were preparing for a fight in altogether different quarters. When the public hearings were closed, they suddenly swept aside pretense and came forward with a new proposition. The subway, which a year before the Elevated had wished to build

and own forever, it was now willing to build and surrender to the city free of cost at the end of fifty years. But it was just a year too late. The people were now wide awake and in no mood for compromise. They had begun to grasp the proper principles of a public franchise transaction, and this offer failed to include those principles. As compared with the Public Franchise League proposition, it meant a net loss of \$15,-000,000 to the city at the end of the fifty years. Moreover, it still ignored the essential principles—city ownership, short tenure, adequate rental, and the referendum.

The Legislature looked with warm approval on the new proposition, and were disposed to consider objection to so magnanimous a concession as almost The committee were at impertinent. first minded to send it on its way with no public hearing whatever. Petitions from the Public Franchise League and the Board of Trade for such a hearing were at first denied, but the smoldering wrath which such action aroused in the community was too dangerous to be invoked, and the hearings were reopened. Powerful arguments against the proposed move were made, but the legislative counsel of the Company, complacent in the astuteness of his move and the servility of the Legislature, contented himself with a perfunctory reply. With but two dissenting votes, the committee sent in a favorable report. The fifty-year term they reduced to forty, but in all other respects the original proposition stood unchallenged, and there was no referendum clause. That was the significant feature. With its customary arrogance, the Company even went so far as to boast that no referendum provision would ever again be part of a subway bill. Over the lack of that provision the fight came.

It was no mere argumentative contest, but bitter hand-to-hand fighting, and the year 1901 stands out in the history of the Massachusetts General Court in regrettable prominence. The Elevated Company and its agents worked untiringly and relentlessly. They bribed the cheaper members with jobs or otherwise, cajoled the friendly, and threatened to

ruin the careers of the upright. On the other side the campaign was no less strenuous. The Public Franchise League, the Board of Trade, the trade unions, and the one newspaper in Boston which consistently fought on the side of the public, the Boston "Post," stood together in the contest. It may be said here that in situations of this kind Boston has little occasion for pride in its newspapers. The principles for which the Public Franchise League strove are now accepted without question. Yet for three long years only one of the city newspapers could see that side of the question consistently and boldly. They apparently agreed with the philosophy of the proprietor of one eminently respectable newspaper in the city who has said, "The first duty of a newspaper is, not to protect the public interests, but to pay dividends."

The result, so far as the Legislature itself was concerned, was a foregone conclusion: but another factor saved the day. In the Governor's chair at that time was a prosperous manufacturer from the western part of the State. Governor Crane was no orator, nor did he waste words of any sort; he was eminently clear-headed, resolute, and determined to follow only that course which he considered for the business interests of the public. The step which he took brought him into National prominence and deeply endeared him to the hearts of Massachusetts. His mind once made up, he proceeded to put his conviction into execution. In the House the bill had passed triumphantly. Amendment after amendment safeguarding the public interests had been crushed with clockwork precision, with the help of an almost solid vote from the Boston Democrats. When it came before the Senate, so often the happy hunting ground of the corporations, the end seemed in sight. came the shock. Governor Crane quietly made the announcement that under no consideration would he sign the bill unless it contained a referendum clause, and perhaps not then. Consternation swept over the corporation crowd. With the Elevated lobbyists swarming all over the Senate reading-rooms, the corridors, and even the Chamber itself, the debate

went fiercely on. But it was too late to do anything except play the hand through, and the bill was finally passed by a vote of 26 to 13, and sent to the Governor. The veto message came quickly and decisively. It was a crisp, concise, and convincing argument. Governor Crane objected not only to the absence of the referendum, but to many other features. No consideration affecting the public interest, the Governor said, can justify the adoption of this extraordinary proposition, for there is no reasonable doubt that the subway can be built by the city and leased for a sum ample to cover interest and sinking Moreover, it not only binds this generation, but it ties the hands of the next. In 1922 all other special privileges of the Elevated road expire; there is no good reason why the public should not come into complete possession of its own then, and grant such further franchises as improvements justify. bill would insure the Elevated command of the situation for twenty more years. The tide of public opinion set strongly with the Governor, and the legislators felt its influence. Many of them hastened to "get into the band wagon." The veto was triumphantly sustained, and the Elevated had been beaten again.

During the following summer and fall the League kept up a steady campaign. Corporations and their legislative agents take no vacations, and in this case the reformers matched them in "eternal vigilance." The candidates for the Legislature were publicly questioned, as election time approached, as to their attitude on subway legislation, and the questions fulfilled their purpose of keeping the matter fresh in the public mind, and inspired that vague dread which has so much influence upon the minds of ambitious politicians. In the city elections a month later the League was to the front again. It was the year of the mayoralty contest, and Mayor Hart was up for re-election against Patrick A. Collins—the shrewd, cautious Yankee against the masterful Irishman. Collins came out flatly and emphatically for a city subway, and even Mayor Hart felt the influence of the growing tide of public opinion, and stated his belief that

conditions had so changed that the city could now afford to build its own subway. Collins was triumphantly elected, and it is his name which is associated with the subway history of 1902, as that of Governor Crane is identified with that of the year 1901. The Public Franchise League, through the Board of Trade, brought up its bill again, and the astute counsel for the Elevated repeated his yearly ingenuous argument, garnished with masses of intricate figures, to show that his Company could not afford financially to accept any such propositionfigures confusing and labyrinthine, but which were brushed aside by the counsel for the Public Franchise League with the statement of a few well-known, manifest facts. An attempt was made to confuse the issue by the introduction of a so-called "tunnel scheme." The city was to build a "subway" for surface cars, while the Elevated Company constructed and owned forever a deep "tunnel" for its elevated trains. It was cleverly planned and backed up by subtle and plausible arguments. For a time it seemed to confuse the minds of the committee, but Mayor Collins appeared before them, and in his bluff, leonine fashion settled that proposition in a word. "Tunnels and subways," he said, " are both holes in the ground, no more, no less, and the same arguments which make it wise for the city to own a subway apply to the tunnel as well."

Weeks were spent in long, tedious bickering over the terms of the bill and its exact wording, during which the attorneys for the Company, in a last desperate chance, attempted to defeat the spirit of the bill by subtle phrasing and ambiguous clauses, while Mayor Collins and the Public Franchise League were openly accused of holding up and needlessly delaying legislation. "Gentlemen," said Governor Crane when the complaint was brought to his attention, "you are perfectly right; don't give in an inch." They did not, and never had, for the session of 1902 ended with subway legislation in the Blue Book almost identical with that asked by the Public Franchise League three years back, in

1900—legislation calling for a subway built and owned by the city, a lease to the Elevated Company for twenty-five years at a rental of four and a half per cent., and a referendum to the people.

Three years of hard fighting and the corporation defeated in every important particular! The odds in favor of the Elevated Company had seemed overwhelming. On their side were ranged those supposed molders of public opinion, the newspapers, with but one exception, the dominant political machine of the city, and all the wealth and resources of great financial establishments. result may be ascribed immediately to the powerful influence of two courageous, public - spirited executives-Governor Crane and Mayor Collins; but behind them was a still more potent force.

That potent force was public opinion, created and directed by the Public Franchise League. This fact is of great significance in the present issue throughout the country between the people and the public service corporations. It was the members of the Public Franchise League who first recognized the public needs and dangers involved in the situation, who won Governor and Mayor over to the view for which they stood, who created in large part, marshaled, and brought into action the massive, intangible force of public opinion. Corruption breeds when the public is inert, and not when people are awake and alive to the issue at stake; and the Public Franchise League kept them awake. The League had among its officers men of ability and achievement, able to meet the men who controlled and directed the forces of the Elevated Company move for move. But they did more than that. They kept in close touch with the people, reduced the various propositions to simple terms which the man in the street could understand at a glance, and forced them on his attention persistently—and the people responded to the appeal. Therein lay the secret of their service and success. The public can, if it will, protect itself and maintain its rights against the greed of corporate wealth and power,

A MESSAGE OF PHILOSOPHY TO THE MODERN MAN

BY HENRY J. HASKELL

ITH the development of modern thought one age-old problem has received an emphasis that the church has not yet fully recognized. The terrible fact of the existence of evil has always appalled men. But it has become tenfold more sinister and menacing when viewed in the light of evolutionary history and of a psychology that dwells on the significance of environment in the making of character.

Job's problem in its more primitive aspects presents no insuperable obstacles to the modern man, however much he may shrink from facing it in his own person. He can understand how these afflictions which are but for the moment may work the far more exceeding and eternal weight of glory in the upbuilding of character. Thus he may reconcile himself to suffering and sorrow and bereavement as somehow having their place in a rational universe. At least he knows that they are externals, that they cannot destroy his real self, and even in his despair he may find consolation in crying out with Henley:

"It matters not how strait the gate,
How charged with punishment the scroll:
I am the master of my fate,
I am the captain of my soul."

But, in spite of the inevitable human interest in self, the emphasis after all has shifted and the sociological view-point constantly thrusts itself upon the modern He understands as never before the interdependence of individuals. What concerns humanity is his concern. And then what sickens him, and causes him to doubt to the bottom of his soul the existence of God, is his outlook upon a world apparently founded on waste and dominated by a blind chance. Then, indeed, he becomes Hegel's man who "has once feared, not for this moment or for that in his life, but who has feared with all his nature; so that he has trembled through and through, and all that

was most fixed in him has become shaken."

Thus, human history, always of deep interest, in the light of modern research has become the most moving of spectacles. Once it was a confused heap of fragments from which a few righteous individuals were plucked as brands from the burning, while the great mass of mankind went down into the pit to a deserved damnation through Adam's sin. Now it appears as a slow struggle of the race upward, in which countless imperfect lives have been sacrificed in order to produce this poor flower of civilization, and in which the present generation, through no merit of its own, is heir to the rich spiritual and intellectual heritage of the ages.

For tens of thousands of years, the spectator of to-day must reflect, humanity labored before it emerged far enough from its brute inheritance to see the glimmerings even of savagery. For other millenniums it slowly fought its way up to the present stage of progress. This slow development of which history is a record—what is it but a vast process of waste? These toiling myriads of the past—what has been their fate save a condemnation to a hideously stunted existence that seems to the modern viewpoint a veritable nightmare?

Where, the modern man must ask, is the justice in all this? Why should I possess this endowment of the twentieth century, this possibility of enjoying a Schubert song or a Corot landscape, this knowledge of the researches of Darwin and De Vries and Metchnikoff, this acquaintance with the meaning of human history, that was barred to my ancestors of a few generations ago, and which is out of the reach of the Hottentot to-day? What have I done to deserve this good fortune? Why is it given me and withheld from Alaric and Attila and Tippoo Tib?

Digitized by Google

Moreover, a psychology emphasizing with Baldwin and Royce the overwhelming importance of imitation in the child's development brings out more vividly than ever the tragedies of the slums and of the homes of selfish wealth. Why, the modern inquirer must ask, why should one child's lot be cast in a tenement whose evil surroundings inevitably mean its moral ruin, or in a wealthy home where it is doomed to an empty existence equally destructive, while another's is in a cultured family where the training insures it at least a fair chance in life? He can understand the inevitableness of evil in a world of free moral beings, but that does not account to him for the victims of chance who become characters involved in damnation because of their vicious environment.

To many thoughtful persons in every community the church as vet brings no hint of a solution of these appalling problems. The minister's amplification of Bible passages, noble and appealing in themselves, is futile. To assure the man who sees the hideous side of the natural order that all things work together for good to them that love God, or that in a future life those who have fought with beasts at Ephesus shall receive their reward, is in vain. It is precisely the existence of God that he is questioning when he doubts the rationality of the universe. It avails nothing to tell him to trust in God's beneficence, if in his view that very beneficence is at stake, or to await a life beyond the grave if he sees no valid reason to believe in the existence of such a life, and if he traces back the lewish belief in the resurrection of the dead to the longing for the return of the faithful to the glories of the Messianic kingdom.

Yet modern thought has not raised these questions to leave them unanswered. The West as well as the East has reflected upon the Whither and the Whence, and has reflected to much greater purpose, though in America alone, at the hands of Professor James, and preeminently of Professor Royce, has the problem of evil received treatment at all commensurate with its significance. If the philosophical idealism of to-day does not provide a detailed answer

to its questions, it at least points the way toward a solution. If it does not offer a "scientific" demonstration of a future life, it is compelled to find an eternal order of which the world of time and space is only a transitory aspect.

With an elaborate rigor of argument that can be only hinted at here, it develops a theory of knowledge which involves the conception of the individual as a fragmentary manifestation of the divine life. How, it asks, can a man really mean any truth, intend to think of it, pick it out, recognize it, unless his deeper self already possesses it? And finally it says to the bewildered soul, Yes, the problem of the apparent dominance of chance over ideals is a hideous one, but each striving, suffering mortal is a finite expression of God, the World-Self. In all these struggles the Infinite partakes, and in the end he wins his perfection by triumphing over the evil. His victory, then, is the victory of all those who have striven with him for righteousness, no matter how feeble their strivings, and in him we mortals finally attain our perfection.

It points out, in the familiar metaphor of the cathedral, that every fragment of stone finds its place in the artistic triumph of the whole; that in those springing arches the topmost particle contributes no more to the perfection than does any other. Thus, it says, the primitive savage, who lived according to his light, finds his place in the eternal structure of the universe, and partakes of its excellence as do we. This was God's world in its significance when Cæsar's legions penetrated Gaul, just as much as it is in this age of electricity, and as it will be in the future, when electricity shall have been superseded. No fragment is lost, even when it has disappeared into what seems, to our poor circumscribed sight, the endless past. For time and space are mere limitations of our mortal poverty, and are transcended in the consciousness of the Infinite, of which we are a part, even as we ourselves may transcend them in hearing successive notes as a whole of melody. Eventually, when released from the restrictions of our narrow time-span and our finitude, this mortal, as Professor Royce has said, shall put on Individuality, shall become a complete individual instead of a mere fragment, and in the eternal order shall rest from its labors at one with God.

And the evil and sinister beings? To them, indeed, philosophy brings no message of honeyed optimism, no assurance that sin is mere ignorance and willful wrongdoing an illusion. With Amos it declares that for them the day of the Lord is darkness and not light. Yet it asserts that they, too, win whatever share in the universe belongs to them. are not independent personalities, isolated from the world of the Logos, with a set of intrinsic natural rights which they may proclaim as the colonies put forth the great Declaration. So far as may be, they participate in the life of the Infinite. But in so far as they are evil and their lives destructive they can belong only to the temporal order, not to the eternal. In the cathedral they may constitute the gargovles, whose only service is in the contrast over which the whole beautiful structure triumphs. Or, to use a figure from time instead of space, their lives may be remembered, indeed, by the Absolute as part of his life; but the memory will be like that of an evil dream which has had only a momentary significance, or of a passing temptation which has been overcome.

These are hints of some of the suggestions that modern philosophy, especially as developed by Professor Royce, has to offer to the soul that is shaken by a contemplation of the great problems that have been emphasized by the progress of thought. The minister who is unfamiliar with this philosophical idealism, who considers the questions of evil and immortality with no knowledge of Kant's work on the ideality of time and space, who has no clear notion of the relation of the individual to God, will be unable to help his more thoughtful parishioners toward a solution of the difficulties that beset them. He may never know why he fails to reach them, and they may not understand why he has no message for them. None the less must they turn elsewhere if they are to find a way of escape from the haunting fear of a universe that seems abandoned to the demons of chance. A few ministers there are who interpret the insight of the prophets in the terms of modern thought, but only a There must be more if the church is to fulfill its mission to the modern world.

OXFORD FROM WITHIN

BY JOHN F. HORNSEY

OW that the American Rhodes scholars are coming to Oxford in such numbers, it may be of some interest to their relatives in the States to know to what sort of a place their boys are going, what are its manners and customs, and, above all, what sort of ideas their sons are going to acquire there.

With this object in view, I intend to discuss, not the mere topographical details of the place, for these can be found in any ordinary guide-book, but its social and intellectual aspects. And this is no easy task, for Oxford has a social atmosphere peculiarly its own. It is different entirely, not only from American towns, but even from similar towns of the same size in England.

Originally the older colleges were semimonastic institutions, intended mostly for the education of young men for the priesthood, and this idea continued until the Reformation, when the course of studies was broadened, and has continued to expand ever since, so that now instruction is given in practically all subjects, including natural science, modern languages, political economy, psychology, etc.

The colleges themselves are constructed on somewhat the same style as monasteries. They are large buildings containing one or more quadrangles, and in some cases have large and beautiful gardens adjoining. The entrance is guarded by a porter's lodge, and the gates are closed at nine o'clock every

evening. Within each college is a chapel, whereat attendance at morning or evening service is compulsory on all students who are members of the Church of England. Other students are obliged to attend roll-call at 8 A.M. There is also within each college a dining-hall, wherein the students are bound to dine together a certain number of times weekly.

From the quadrangles a number of staircases lead up to the students' rooms, which are, in the main, comfortable and well furnished. Within the same college and upon the same staircase we have students of every kind. A theological man has rooms perhaps on the same landing as a medical or legal student. And thus these men, living under the same roof, become acquainted with each other, exchange visits, and naturally exchange ideas also. This, to my mind, is the essential advantage of the residential system in vogue in Oxford. In those universities where students of the same subject are accustomed to live together under the same roof the inevitable result is the production of narrowminded and pedantic men. But at Oxford the association of opposites and the mutual exchange of opinions leads to the formation of characters which are neither bigoted nor prejudiced.

Unless a boy comes from a large and well-known public school, such as Eton or Harrow, and has in addition considerable wealth, it would be foolish in the extreme to send him to one of the greater colleges, such, for example, as Christ Church or Magdalen, for the inevitable result would be either the temptation to live beyond his means and incur considerable debt or to occupy his rooms in college in solitude and loneliness.

Nevertheless, there is considerable intercollegiate sociability between the students, and it is the aim and ambition of most students to know and to be known by the greatest possible number of students from other colleges.

These acquaintances are made in many varieties of ways—on the football field, in the Common Room, at the Union, or elsewhere, and are generally followed by invitations to "tea" or "coffee after Hall."

There is one institution, however,

concerning which I ought to say a word or two. This is the "breakfast." It is not alogether a student custom, inasmuch as the "Dons" themselves are the greatest offenders. If ever there is an occasion when the average man feels least amiable, it is when he has to get up early, dress carefully, and, probably famishing with hunger, walk half a mile through the damp morning fog to breakfast with his tutor. Here he must smile and look pleasant.

These are some of the disciplines to which the student is subjected, and not the least among these are the invitations to afternoon tea with the wives of the "Dons." Here the chief difficulty which the average student has to face is to have a constant supply of small talk, which must not show any great intellect or individuality, for to show either quality on such occasions is a deadly offense. The first topic of conversation is generally that unfailing one, "the weather," which in Oxford usually provides food for comment for at least a quarter of an hour. I say "comment" advisedly, for conversation seldom exceeds a few fatuous remarks in the midst of an audible silence, each person meanwhile nervously balancing a cup of tea and a piece of bread and butter in his hands. Things begin to warm up, however, when the hostess introduces the subject of football, rowing, or some other sport, when the topic is taken up for another quarter of an hour, after which a second silence falls. It is now very amusing to watch the faces of the guests. Each one looks around furtively to see who is going to get up first, wish the hostess "goodafternoon," and take his departure. The anxiety displayed on all countenances is truly wonderful, and must strike any one possessing the least sense of humor as utterly ridiculous. At length one bold spirit arises and leaves, a great crowd now gets up suddenly and follows like a pack of sheep, and the levee comes to an end. During this time there is none of that vigorous, intellectual, amusing, or cheerful conversation which we are accustomed to associate with gatherings of American people, nothing of the "gemuthlichkeit" of the German, nothing of the witty repartee of the French. After such a deadly dull entertainment it is small wonder if some students come out with an irrepressible desire to shout, get drunk, and burn each other's furniture as a sort of a mental antidote.

Convention is the great idol which is worshiped in Oxford, and the constant desire to conform to certain little ways, manners, and customs tends to make all Oxford men alike. "I can always tell an Oxford man when I see one," I once heard a man say; "they are all alike as two peas in a pod." Despite this, however, I feel convinced that the really successful man who afterwards makes a name in the world is the one who, while tactfully pandering to the goddess of conventionality at Oxford, carefully conceals his intelligence for the world which always judges him by his merits.

One of the Oxford customs which must have struck the first American Rhodes scholars with surprise and not a little dismay is the lack of recognition after attending a social function. Your host of yesterday passes you in the street with a stony stare when he meets you the following day; but one must not be offended, for this is only "Oxford etiquette."

In illustration of the state of social affairs here the experience of a certain professor from a Western American college will be of interest.

Having accepted many invitations from Fellows and Dons to breakfast, lunch, and tea in the sacred precincts of various colleges, he thought it would be pleasant to return hospitality by inviting his former hosts to his lodgings in small groups of three or four. This he found did not meet with the views of his guests, who showed by their demeanor their unwillingness to meet each other; so he was forced to the alternative of inviting them singly.

In view of the Bishop of London's recent sermon on "drunkenness at Oxford" which has caused such lively comment in the papers on both sides of the Atlantic, it may not be amiss to make a few remarks.

On the experience of twenty-four years' residence in Oxford, four of which were spent as an undergraduate, I can safely

affirm that there is no more drunkenness among the undergraduates of Oxford than among any other body of Englishmen of the same age taken at random. Furthermore, I venture to say that not only the morality of the University, but the public morality in the city of Oxford in this respect is inestimably better than it was sixty years ago. I have this on the authority of a very old resident who died quite recently. This gentleman said that when he was a boy "nearly every tradesman in the High street was drunk before midday, and that a man who did not drink was considered to be a nincompoop "(whatever that might

Since the Rhodes scholars made their first appearance in Oxford I have heard of one significant incident. In nearly all the colleges it is an old custom for the second and third year men to entertain the freshmen by what is known as a "Fresher's Drunk." This orgy is held in the rooms of one of the Freshmen, whether the occupier wishes it or not. Last winter, however, one of the American Rhodes Freshmen was informed that on a certain evening there would be a "Drunk" held in his rooms, so that he had better prepare to receive the guests.

The Rhodes man quietly but firmly told his informer that he personally had no objection whatsoever to their having a "Drunk." but that it would not be held in his rooms. The Senior looked at him and gasped; for such independence on the part of a Fresher was almost unheard of before. However, it was determined by the "Drunk" Committee that, nolens volens, the Fresher should submit. But when the eventful evening came, and the "Drunk" Committee visited the Freshman's rooms, they were met by an assembly of the friends of that Freshman, all Americans, tall and muscular, like himself, who smiled pleasantly, and cordially invited them to come in. Needless to say, there was no "Drunk" held that evening.

In this manner the Rhodes scholars have it in their power to exercise an improving influence on Oxford student life which will be welcomed by all right-minded Englishmen.

There is no doubt that for many years

Oxford has been asleep, and Rhodes knew it. His act in the foundation of scholarships will not only benefit the University pecuniarily, by reason of so numerous an influx of students, but it will effect a much greater and more important object in initiating a progressive spirit into all departments. Another happy circumstance by which Oxford has already commenced to benefit is the election of Dr. Osler, of the Johns Hopkins University, to the Regius Professorship of Medicine. Under his influence and personality the students in that department have been infected with an enthusiasm hitherto unknown.

There is one other subject about I ought to say something. While in conversation with some American people the other day, I was asked if there was any danger of American students acquiring at Oxford ideas which, although proper to England, might be unconstitutional in America.

This fear is, I understand, held by not a few American people, who, having visited England, have observed a great many customs which they rightly attribute to the remnants of the feudal system, and to which, as republicans, they have strong objections. In answer to this I can only say that, if the Rhodes scholars of the future are chosen with as good care and judgment as the first contingents were, and with due regard to their ages—in not sending boys who are too young and impressionable—then Americans have little to fear from this cause.

On the contrary, the Rhodes men will be capable of discriminating between the desirable and the undesirable customs of the mother country, which have alike been preserved side by side by our conservative habits, and they will be enabled to carry back with them what is best among our manners, our traditions, and our laws.

GOOD FRIDAY

BY MABEL EARLE

"I am crucified with Christ."-Gal. ii. 20

Into Thy hands, O God!

The sun is turned to blackness in the sky;
I cannot see the way my feet have trod
Unto this Calvary.

Laughter and threats and wailing fade away,
Hushed in the gloom that lies above the lands;
Taunting and tears are ended for to-day.
Into Thy hands!

No more the thirst denied;
No more the crying, while earth staggers shaken,
Unto that Other, crowned and crucified,
"My God, I am forsaken!"
In His eternal fellowship of loss,
Mocking, and shame, and bitterness of bands,
The Crucified has looked upon my cross.
Into Thy hands!

Not now in death's deep peace,
Yet in the peace of suffering with Thee,
For tribulation which shall never cease
So long as life shall be,
For all the bitterness Thine own heart bore,
For all the pain Thy pity understands,
For life and death and love forevermore—
Into Thy hands!

THE SPELLING OF YESTERDAY AND OF TO-MORROW

BY BRANDER MATTHEWS

VERY one of us who has had to do with books is continually disappointed because some special work he wants to read or to consult does not happen to exist. There are many of these unwritten books which we would welcome gladly, whenever any author may see fit to write them. For instance, in my own study of the stage and of its allied arts I feel the need often of a solidly documented "History of Scene-Painting from its Origins to the Present Day." And in like manner, when I turn to the study of our own language, I am forced constantly to regret that no one has yet taken the trouble to prepare an ample and scholarly "History of English Orthography." The material for this history of our spelling is abundant and accessible; and although a chapter or two has been attempted, the long record of our ever-shifting orthography is not to be found in any single volume. Such a volume would be specially serviceable just now when there is an organized movement to persuade us to accept certain proposed simplifications of our spelling.

There is one immediate advantage which would result from our having in our hands a satisfactory historical account of English spelling, since even the hastiest study of its pages would convince us once for all that we need feel no veneration for certain of the most flagrant absurdities of our accepted orthography, as the worst of them are often comparatively recent, having no sanction of antiquity. There are many who instinctively dislike the accepted spelling of rhyme, for example, and of comptroller—two of the most obviously ridiculous of our current orthographies but who are too weak-kneed to take the liberty of simplifying either of these spellings, and who would be greatly gratified to be informed that these accepted complexities are only a few score years

old and that the words were originally spelt as they are pronounced, rime and controller.

The publication of this "History of English Orthography" would have a wider effect than this, for it would convince the average reader that there is not now any "standard" spelling for all the words of the language, and that there never has been any standard in the past. There is divergence of usage between writers of distinction to-day—as there always has been. There is disagreement in the recommendations made by the foremost dictionaries—as there always has been. There is no uniformity nowand there never has been any uniformity. And what we need to grasp most firmly is the fact, not only that there is not now a standard of spelling, but also and more emphatically that there has never been any authority to set up a standard. Spelling is like speech; it is the result of a tacit agreement to employ certain symbols; and every one of us reserves the right of individual judgment as to the symbols he will employ.

If any man insists upon the misleading spelling of comptroller, we can assure him that this orthography misrepresents the sound of the word, that it also suggests a false origin, and that there is an absurdity in combining a sturdy old English word with Frenchified complexities which mean nothing; but the culprit may retort that he likes to spell the word in just that way and that he proposes to do so for ever and ever; and what are we going to do about it? To this there is no answer except to admit the right of any individual user of the language to spell as he sees fit. This admission assures to the willful man the privilege of clinging to comptroller, while it also asserts the right of any one else to use the more logical, the simpler, and the older controller.

Other willful men may cling to metre,

Digitized by Google

although they are in the habit of spelling its compounds diameter and ther-They may prefer to bestow a needless French tail upon programme, although they spell epigram without any such wasteful redundancy. They may have a fondness for another French termination in cigarette and aigrette, although omelet and epaulet and toilet have long managed to survive shorn of this appendix. And these willful men have each of them a right to this opinion and to this orthography, if they choose, for who is to say them nay? Who has any warrant to interfere? And, on the other hand, they have no right to object to those of us who prefer the simplest forms, and who write not only rime and controller and meter, but also tho and altho and catalog. We claim the same privilege that we grant to every one else. But it is only a privilege to be exercised with discretion; it is not a duty to be performed in accordance with law. There is not a right spelling of any word to be enforced upon every one; there is only an accepted spelling, which may be modified from time to time by tacit consent. And the "History of English Orthography" would show that countless modifications have taken place since the invention of print-

It would show that the English language, like every other language, has been vainly striving to make its spelling exactly represent its pronunciation, and that it has failed to succeed partly be cause the pronunciation of a language is constantly changing—and generally changing more rapidly than the spelling can be modified to conform to it. change in pronunciation—like that of either, which was eether half a century ago, and which now seems to be eyether -can spread very swiftly by imitation: but a change in spelling to correspond exactly with the new pronunciation meets with far more resistance, since the eye seems to be more conservative than the When the eye has long been accustomed to certain symbols as conveying a certain meaning, it is annoyed that these customary symbols should be disturbed. even when they are no longer accurately representative of the sound. This is why

"fonetic reform" is really impracticable, even if it is wholly desirable; to accomplish it there would have to be uniformity of pronunciation, or at least an absolute standard of pronunciation, which does not exist now and which never has existed. And even an approximate approach to phonetic exactness of orthography would call for so many alterations of the symbols to which our eyes are accustomed that we may dismiss it as impracticable, so remote from realization that discussion is futile. And yet we ought to seize every chance that offers to keep our spelling as near to our pronunciation as may be possible, or else the future of English orthography will be worse than the present.

And its present is surely bad enough. English, so a learned historian of our noble speech has recently declared, is now "the most barbarously spelt of any cultivated tongue in Christendom. We are weltering in an orthographic chaos in which a multitude of signs are represented by the same sound and a multitude of sounds by the same sign." And he then illustrates this confusion by drawing attention to the fact that one and the same sound is now represented by e in let, by ea in head, by ei in heifer, by eo in leopard, by ay in says, by ai in said, and by a in many. Here we have seven different symbols for a single vowel sound; and the most of these same symbols in other words represent other vowel sounds. Nor are the consonants very much more exact, as we see when we are reminded that one and the same sound is now represented by s in sure, by sh in ship, by sci in conscience, by ci in suspicion, by ce in ocean, by ti in notion, and by xi in anxious—again seven different symbols for a single sound.

Here is chaos come again—a chaos so widespread and of such long standing as to make it hopeless for any one to attempt a radical reform and to urge a rigorous representation of a single sound by a single symbol always the same. Our race is very conservative; it clings to ancient landmarks; it has a misplaced affection for all these multiplied and misleading symbols. The earlier movements for spelling reform failed to ac-

complish much, because their leaders did not take into account this indurated conservatism, which is unwilling to change even when the reasons for the change are overwhelming. Any future movement for simpler spelling can hope for success only in proportion as it reckons with prejudice and as it makes its approach along the line of least resistance. If we cannot be browbeaten by logic into accepting a single symbol for a single sound, perhaps we can be persuaded to strive for an easier simplification by leaving out superfluous letters of all sorts, which merely dilute our ordinary orthography, and which have often no right to be there, having been thrust in comparatively recently.

The spelling of English is now more foolish than that of German or of French (both of which have been emended of late), partly because English has, unfortunately, suffered more than any of the other modern languages from the evil influence of uneducated printers and of half-educated pedants. And it would be part of the duty of the author of the "History of English Orthography" to show the extent to which these two sets of foes had done damage to our spelling. The printers were the first in the field, and their misdeeds are at once easier to understand and harder to counteract. The earliest printers in England were not Englishmen; mostly they were Germans or Dutchmen, to whom English was a foreign speech.

Now, it is possible for compositors to set type in a language of which they are wholly ignorant, but they probably would be less careful and make more blunders in setting up books in a language which they half knew. "As foreigners, they had little or no knowledge of the proper spelling of our tongue," so Professor Lounsbury has recorded, adding that, "in the general license that then prevailed, they could venture to disregard where they did not care to understand." The result is that the spelling of the original editions of the masterpieces of Elizabethan literature is a marvel of typographic incompetency and of orthographic recklessness. The spelling is less accurate, it is more clumsy and more slovenly, than it had been when the

multiplying of books was left in the hands of the better-trained copyists.

So startling were the variations in the spelling even of ordinary words that a reaction was bound to follow. Toward the end of the seventeenth century and in the earlier years of the eighteenth an effort was made to bring order out of chaos. Unfortunately, this attempt towards uniformity was not guided by wisdom or by knowledge, but solely by chance and by caprice, since it was the work of the printers themselves, who knew nothing about the principles which should control the adjusting of spelling to pronunciation. A certain kind of uniformity was achieved in time by the acceptance of the standards set by the printers for their own convenience. This uniformity, from which our children are now suffering, was external, arbitrary, mechanical, and unscientific. In effecting it, so Professor Lounsbury has declared with characteristic plainness of speech, "in effecting it, propriety was disregarded, etymology perverted, and every principle of orthography defied."

It was a grave misfortune that the mismade spelling thus casually manufactured was accepted by Dr. Johnson, whose "Dictionary," published in the middle of the eighteenth century, gave it currency and authority. And if the English language has to-day the worst spelling of any of the modern languages, this is due largely to the influence of Dr. Johnson, and to the weight of his ponderous personality. If he had only known just a little more about the history of his own language, and if he had exerted his dominating influence against the more obvious absurdities and inconsistencies foisted into our spelling by the narrow pedantry of arrogant proofreaders, secure in a perilous half-knowledge-in fact, if Dr. Johnson had not only known more about English, but had also cared more—our orthography would be less unsatisfactory to-day and it could be more easily set right.

In his regard for Latin and in his ignorance of English as it had been before the printers came, Johnson accepted comptroller, ignoring the older controller. He allowed sovereign and foreign (as though they had something

to do with the Latin regno) instead of the older sovran and forrain. adopted debt, though the older form dett was better in every way; and a useless b was also permitted to disfigure doubt, which had earlier been free from it. He kept a Latin p in receipt, though he left it out of deceit. He spelt deign one way and disdain another. He was willing to leave a needless and misleading s in island, although it had been iland in Shakespeare's time. He seems to have supposed that the older English agast would look more ghostlike if spelt aghast. He saw no harm in delight, although the older form, representing more accurately both the sound and the origin, was delite. He cast out the Shakespearean ake for a labored ache. He made a wasteful and inexplicable distinction in the spelling of the final syllables of accede and exceed, of precede and proceed.

The more clearly we see the full effect of Johnson's influence in fixing upon our orthography all these infelicities and many others like them, the more we are moved to regret that the burly doctor undertook to prepare the dictionary of a language which he had not investigated historically and in which he held it disgraceful to compose an epitaph. The arguments which Dr. Johnson advanced in his pamphlet on "Taxation no Tyranny" did not convert our forefathers then fighting for their freedom; and perhaps the time has now come when their descendants can decide for themselves whether they will accept or reject the cumbersome spellings preserved in the dictionary made by the man George III. pensioned.

If only we had the "History of English Orthography," we would find it easy to answer one protest frequently made against any proposed simplification of our spelling. This is to the effect that novelty is distasteful and that it is our duty to preserve for our children the orthography which was used by Scott and by Swift, by Spenser and by Shakespeare, since the spelling that was good enough for these great masters of English literature ought surely to be good enough for us. Of course this protest is never voiced by any one who is familiar with the original editions of Shakespeare

and of Spenser; it is possible to those who are familiar only with the ordinary library editions set up in "modern spelling"—that is to say, in the spelling arbitrarily agreed on in the printing offices of the eighteenth century and ignorantly accepted by Dr. Johnson. This "modern spelling" misrepresents the text of the masters of English literature. Although it was accepted in most of the editions issued in the nineteenth century, it is now rejected by the severer scholarship of our own time, which insists on reproducing the original orthography.

Even in default of a satisfactory "History of English Orthography," the multiplication of these more scholarly editions of the English classics will soon convince even the careless reader that English spelling has always been shifting and that it was often simpler in the past than it is to-day. It will convince him that the so-called "modern spelling" has no sanctity from use by the masters. It is not the spelling of Steele and Swift, of Shakespeare and of Spenser; it is only the spelling of Samuel Johnson, author of the "Vanity of Human Wishes." is the spelling of yesterday, but it is not the spelling of the day before yesterday; and it will not be the spelling of tomorrow. Many of the more flagrant absurdities of the Johnsonian canongovernour, for example, and waggon and gaol—have already been abandoned here in the United States. Many more are likely to be given up in the immediate future. Already is rime making its way back into use; and probably sovran would seem strange now to no student of Lamb or of Milton. No lover of Tennyson finds anything unusual in leapt and stopt, which the Laureate liked better than leaped and stopped, perhaps as more frankly monosyllabic and therefore more harmoniously fitted into his verse, and perhaps because he followed the practice of the older poets of our tongue.

It was the shrewd Bismarck who declared that "we cannot hasten the course of time by setting our watches forward." But the course of time is even steadier in its advance than the most trustworthy of our watches. Even in the nineteenth century there was some advance toward

simplicity in our spelling; and now at the beginning of the twentieth century the time seems ripe for another step or The newly organized Simplified Spelling Board is receiving substantial assistance from Mr. Carnegie, who holds that only its orthographic confusion is now retarding the spread of English and its swifter acceptance as the worldlanguage. This new Board is profoundly convinced that the peoples who speak English are very conservative and very slow to move along the path of reformation; and therefore it is going to refrain from all radical suggestions. Its members agree with M. Brunetière that "we can do what we desire only on condition that we do not desire what is not in our power."

The Simplified Spelling Board is prepared to make haste slowly and not to expect too much in a hurry. It is planning a campaign in which ultimate victory is only dimly foreseen. It proposes first of all to call public attention to the whole question, and to keep on calling attention to it, urging every man to inquire into it for himself and to decide on his own course. It hopes to be able to encourage independence and to overcome lethargy, and in time to make a breach in the walls of bigoted conserva-It will draw up a list of words now spelt in two ways, and it will urge the public and the publishers and the printers to accept finally the simpler of the two. It will lend the weight of its authority to the various minor simplifications now struggling to establish themselves—tho and altho, for example, catalog and program, esthetic and maneu-Attempting only the easiest things at first and those nearest at hand, working along the line of least resistance and arousing as little opposition as possible, it will propose still further simplifications by the casting out of letters which are plainly superfluous. Slowly and steadily, without haste and without rest, it will try to win acceptance for many little simplifications, inconspicuous and unimportant individually, but collectively putting our spelling in a more satisfactory position to take a longer step in advance whenever the public has been prepared to consider this favorably.

One result of these efforts of the Simplified Spelling Board is likely to be the restoration of many an old spelling discarded foolishly in the eighteenth century. And another will be to accelerate more or less the constant tendency toward simplicity (by the casting out of useless letters) which has been steadily at work in English from the very beginning, and which is opposed only by those who are obstinate in declaring that there shall be no change of any kind hereafter. Board believes that this attitude of opposition to all change is not only contrary to the tradition of the language, but also that it is unreasonable in itself. It feels assured that its fellow-citizens, however wedded to the existing forms, can be made to see clearly the many disadvantages of the present spelling of our language, with the resulting wastefulness of time and money, with its inconveniences for foreigners, and with its cruelty to our own children. The few and simple changes that they propose to urge will seem strange at first to us, no doubt, just as jail and almanac and wagon seemed strange at first to our fathers, accustomed to gavl and almanack and waggon. But as our fathers accepted these after a while, so our children will accept other similar simplifications.

In M. Brunetière's admirable "Histoire de la littérature française classique" there is a striking passage, which all will do well to bear in mind who propose to improve their own language: "Neither orthography nor pronunciation—which in all the languages of the world, ancient and modern, has never been more than an approximation—depends immediately on the caprice or on the will of men. They evolve with us, under human influences generally, although no doubt there are physical influences also; but even when we can disengage these influences we can never have more than a retrospective knowledge of them, since they have about exhausted their action when we succeed in defining it. And this is why the orthography and the pronunciation of a language change, more or less, from century to century; this is also the reason why they can never be 'reformed." The one comment which

needs to be appended to this is obvious. Orthography cannot be "reformed" out of hand; but it can be bettered. And

it is equally obvious that it can be bettered only by sustained and intelligent effort.

THE SPANISH INQUISITION'

R. Lea combines two characteristics which are not always, perhaps it would be safe to say not often, combined in the same historian—accuracy of historical statement with genuine human interest. The writer who can perceive and portray historical crimes with no feeling of indignation, and historical heroisms with no feeling of enthusiasm, is not, though he thinks that he is, a scientific historian. He is not scientific because he treats men and women as though they were puppets, and they are not puppets. On the other hand, the writer who uses history to advocate a political thesis, as did Clarendon and Macaulay, or who, in writing history, is largely influenced, if not controlled, by the relation of the event to the dramatic effect which he unconsciously wishes to produce, as was Renan to a large extent and Froude to a less extent, is an imperfect historian. Neither of these criticisms can be brought against Dr. Lea. His previous works have established his reputation as a painstaking and a conscientious scholar. He has studied his subject with an open mind. His "History of the Inquisition in the Middle Ages" and his "Superstition and Force" are recognized by scholars as having all the value of authorities upon their respective themes. Probably the same thing may be said of his other publications, with which we do happen to be equally familiar. Doubtless it will be justly said of this work when it is finished. But the author's painstaking and conscientious study has not deadened, certainly it has not destroyed, his human sympathies. is neither imaginative nor emotional in the ordinary sense of those terms; but he lives himself in the age which he portrays, without identifying himself with any of its parties, and he enables the

thoughtful reader also to live in that age His narrative is not dramatic in form. It never even suggests the theatrical. But it is thoroughly human. Admirable illustrations of this vital quality of his work are afforded by his portraits of Ferdinand and of Isabella.

This first volume is largely devoted to tracing the rise of the Inquisition in Spain. It appears here, not, as it has often been portrayed, as an exhibition of ecclesiastical bigotry of conscience. It cannot be defended on the ground that its promoters and advocates "meant well." That cannot be said for them, certainly not without great qualification, which Paul said for himself, not indeed in justification but in explanation of his persecuting spirit: "I verily thought with myself that I ought to do many things contrary to the name of Jesus of Nazareth." In the case of the Inquisition conscience was an afterthought. The original incentive was race prejudice and sordid greed. It was at first directed almost exclusively against the Jews. The prejudice against the Jews was then, as it is now, largely racial, social, and commercial: though religion. which now, at least in this country, is mildly directed toward an amelioration of that prejudice, was then vigorously employed in stimulating and intensifying the prejudice. The Jews were hated partly because they were Jews, but still more because they were successful Jews. If they had been poor, it is doubtful whether there would have been an Inquisition; it is practically certain that there would not have been the Inquisition. Envy, greed, and race hatred were the immediate causes which led to its establishment at the time and in the way in which it was established. The Church fanned the flames which it ought to have endeavored to extinguish, and which probably it might have extinguished. The Inquisition, says Dr. Lea, was primarily due to "the effects of the Church in

¹ A History of the Inquisition of Spain. By Henry Charles Lea, LL.D. In Four Volumes. Volume I. The Macmillan Company, New York. \$2.50.

arousing the greed and fanaticism of the people and in repressing the kindly fellowship which had so long existed. The lowship establishment was a triumph of the anti-Semitic party; its first efforts were directed almost wholly against the Jews; and if conscience justified the work, the immediate incentive was not an intolerance of heresy as a crime against God. but, first, an intolerance of the Jews as a provokingly prosperous people, and, second, the profits that could be made and were made from the confiscation of their very considerable estates. The defense that has been sometimes made for the Inquisition, that it grew out of the discovery of a plot to overthrow the Spanish Government, discovered among the Jews, appears to be even more an afterthought

than the appeal to the laws then current everywhere against heresy, since it appears clear from Dr. Lea's volume that such plots as were formed were simply hopelessly wild attempts at resistance to a scheme of persecution which aimed at wholesale extirpation and accomplished wholesale confiscations.

A final estimate of this work must, of course, be reserved until the work itself is completed; but it is quite within bounds to say that the present volume gives assurance that the completed work will more than fulfill the author's modest hope, expressed in his preface, that his researches have "enabled me to present a fairly accurate survey of one of the most remarkable organizations recorded in human annals."

even if we had to lose some of the

Wyant, for the latter artist, as Mr. Isham

admits, makes no such varied and ample

appeal as does the former. Exact appro-

priateness in selection, however, is not

always characteristic of the pictures chosen to illustrate the individuality of

the artists whose work is described in

this volume. Taken as a whole, the

illustrations are fairly good, but they

do not unerringly represent the most

characteristic and admirable achieve-

ments of the respective artists. There

are twelve full-page photogravures and

many more than a hundred other illus-

trations. From them one may obtain

an adequate comprehension of what the

various schools of American art have

meant—the Hudson River School, for

instance—and in this the illustrations are distinctly valuable. But as being

exactly illustrative of the distinctive

traits of individual artists, the selection

is open to some criticism by the fas-

AMERICAN PAINTING

tidious.

N a large, illustrated book on the history of art—whether of art in general or of each special department, as architecture, sculpture, painting, or music—the first appeal lies largely in the volume's illustration. Before reading the text one turns page after page seeking the pictures which are characteristic of this or that particular artist's work. For instance, one would hope not to be disappointed in finding an illustration of Trinity Church, Boston, as depicting the characteristic quality of Richardson's achievements in architecture; an illustration of the Sherman statue in New York City, as showing what Augustus Saint-Gaudens has done in sculpture. In the present volume, turning to an illustration of the work of a peculiarly American painter, George Inness, one is not disappointed. Page 258 shows the splendid "Delaware Valley," owned by the Metropolitan Museum, New York City; not a fullpage picture, as is Wyant's beautiful "Broad Silent Valley" on the opposite page, but a fairly creditable illustration. and one exquisitely appropriate. could have wished, however, for a greater Inness emphasis in size of illustration

As to text, these fastidious critics may also have at first some sense of disappointment. Whatever may be said of Mr. Isham's judgment as to painters who have now passed away, his judgments regarding the living seem at first somewhat conventional and rather metallic, lacking at times both atmosphere

¹ The History of American Painting. By Samuel Isham. The Macmillan Company, New York. \$5, net.

and discrimination. One has the uneasy feeling that Mr. Isham, himself an artist, is not altogether untrammeled in his criticisms; few critics having his intimate personal friendships could be in writing of living American artists. In this volume we have not only the sugar-coated pill; in some cases the pill seems practically all sugar.

But this is hypercriticism. Taking the book as a whole, the text is a distinctly and notably valuable aid to a general grasp of the history of American art, and Mr. Isham's work is worthy to stand alongside its predecessor, Mr. Taft's "History of American Sculpture," in the impressive new series of volumes on art which Professor John C. Van Dyke is editing. These volumes in their beautiful print and binding are an adornment to any library, as they are of suggestive help to any student of art.

Mr. Isham's method of treatment, whether of schools of painting or of individual painters, is necessarily histori-After a chapter on the primitives, he considers successively Copley, West, Stuart, and Trumbull; Allston, Malbone, and Vanderlyn. The decline of the English influence, as shown by these artists, was followed by the rise of a native school. New York became an art center. There is, of course, something to be said for figure painting there. and Mr. Isham says it well. There is also something to be said for the beginnings of landscape painting and the famous Hudson River School; if it is fashionable nowadays to shrug one's shoulders at mention of that school, Mr. Isham does a service to all students of art history by clearly defining the place in that history of the Hudson River School and the good that has come of After the Civil War French influence forged to the fore. La Farge and Whistler became famous—La Farge, surely an American artist by every conventional test, as Mr. Isham justly says; Whistler's art, on the other hand, was not English nor yet American; in its derivation it was purely French. Then a new movement arose, out of which the Society of American Artists grew. Landscape, figure, and portrait painting now became more individual. Finally, mural decoration advanced to a commanding place.

All these periods are luminously treated by Mr. Isham. If we must select one, however, in which the present volume seems specially notable, it would be that period marked by the old Düsseldorf Gallery and the rise of the National Academy of Design. We are naturally prone to jump from the great names of the early years of the last century to the great names of its later years; we are apt to forget the comparatively barren middle period, a period happily closed by the influence of the Barbizon School and of France generally. In this connection Mr. Isham raises the interesting question whether American art is better or poorer because first influenced by England and not by France.

The history of the periods of American painting, as recounted by Mr. Isham, is never allowed to become dull and prosy. If the value of his book lies first in its excellent survey of painting as a whole, another value—and one which, in the eyes of the general reader, not the student, may seem even greateris the incidental illumination concerning the lives and careers of individual artists. This is specially noteworthy in the cases of Benjamin West and Gilbert Stuart. After reading Mr. Isham's pages we understand better how it was that practically all the American artists of his day went over to London to study in West's studio, for we realize West's importance as we had not before. Peter Pindar, who was then enormously popular, brought West into his doggerel rhymes, as for instance:

"Of modern works he makes a jest, Except the works of Mr. West."

Upon the death of Sir Joshua Reynolds in 1792, West was elected President of the Royal Academy, an office which he held until his death, with the exception of one year. Mr. Isham shows that West's deposition was due entirely to the King's mental condition. Mr. Isham also points out West's prevision as a critic. When Constable showed him some early studies, West exclaimed: "You must have loved nature very much before you could have painted this;"

and then, after touching in some lights with chalk, added, "Always remember, sir, that light and shadow never stand still." Constable said that it was the best lecture on chiaroscuro he had ever heard. No wonder that Tuckerman, who is not well disposed towards West, is forced to admit that "more than one generation of American artists have cause to bless his memory."

As to Gilbert Stuart, we gain a somewhat more graphic idea from Mr. Isham's interesting pages of one who painted the portraits of three kings, to say nothing of less exalted persons. Such a one was naturally not embarrassed in the presence of the mighty, even in that of the great Dr. Samuel Johnson himself. When that *Ursa Major* (and he was often a great bear in manners) visited West's studio, he patronizingly remarked that one of the pupils—a certain Gilbert Stuart—spoke very good English. Turning to the latter, Johnson

asked where he had learned it. Stuart quickly retorted: "Sir, I can better tell you where I did not learn it—it was not from your dictionary."

But in one mighty presence Stuart became embarrassed, almost awestruck—George Washington's. The rattle of talk with which Stuart was accustomed to divert his sitters completely failed him. Though the President was kindly and courteous, the painter was ill at ease, and the first portrait was not a success. Stuart was so dissatisfied that the President consented to sit again, the result being the "Athenæum" head on an unfinished canvas, showing the left side of the face. That portrait remains the accepted likeness of the Father of his Country.

Thus this survey of the history of American painting becomes peculiarly readable as well as valuable because of the high lights everywhere thrown on the narrative.

Comment on Current Books

Among the more important of **Important** books quite recently received New Books and not included in the following survey of current publications may be mentioned: Professor M. V. O'Shea's "Dynamic Factors in Education" (The Macmillan Company); Dr. Charles M. Pepper's "Panama to Patagonia" (A. C. McClurg & Co.); H. R. Meyer's "Municipal Ownership in Great Britain" (The Macmillan Company); Andrew Lang's "Sir Walter Scott" (Scribner); Dr. Edward Westermarck's "The Origin and Development of the Moral Idea" (The Macmillan Company).

The Challenge

A story of somber power, with Alaska and its early Russian occupation as its subject. There is decided value in the tale's study of motive and character, together with a singularly full acquaintance with the local color and of a little-known historical episode. (The Challenge. By Warren Cheney. The Bobbs-Merrill Company, Indianapolis, Ind. \$1.50.)

Christianity and the Working Classes

Description of Parliament, labor leaders, and others—contribute short papers on this subject to a volume edited by Mr. George Haw, who writes its Introduction. Two typical opin-

ions may be quoted here. Mr. Will Crooks, M.P., speaking for the laborers, says that they have forsaken the churches, not because of indifference to religion, or of unbelief in Christ as they understand him, but because they find little intelligent human sympathy there. Canon Barnett, long identified with the social settlement in Toynbee Hall, says the churches need to learn of John the Baptist to "throw people on their recognized duties," and to stand "for the recognition in political and industrial life of the law of justice and mercy." In various points of view these writers point out what to do and what not to do in order to draw together the churches and those who are sometimes spoken of as " the lapsed masses." Though written for Englishmen amid English conditions, these papers give timely and helpful suggestions to those who are studying how to cope with similar conditions here. (Christianity and the Working Classes. Edited by George Haw. The Macmillan Company, New York. \$1.50.)

Christian Origins

This work of commanding interest is from the pen of Dr. Otto Pfleiderer, than whom none is more conspicuous in the radical school of critics with which confessional orthodoxy in Germany is now engaged in an intense strug-

gle. The presupposition on which it is based is unquestionably sound, viz., that dogma must not dominate the interpretation of history, but history must determine dogma. But what is history only criticism can determine. The faith of mankind will certainly not be yielded to any history that has not gone through such sifting. Dr. Pfleiderer takes up, first, the preparation and foundation of Christianity as effected by philosophy, pagan and Jewish, and by the life and teaching of Jesus; after this, the evolution of early Christianity into the Church. It is characteristic of him to present masterly learning in a genial and winning form. To read him with an open mind is to be carried along by him, unless one is mindful of the personal equation and differing points of view. For instance, Jesus' precept of non-resistance is viewed as a piece of asceticism, motived by belief that the end of the world was so near that it was not worth while to stand for one's rights. But may it not, in view of the fact that it was addressed to those who were about to enter on centuries of persecution, be more reasonably regarded as intended to inculcate the very course which the Church actually followed, and thereby triumphed in the end? While it is rather difficult to discover an objective basis for some of Dr. Pfleiderer's positions, others, far enough from the common belief, are more tenable. One may accept his finding that the kernel of Jesus' doctrine is self-surrender to the will of God and to social service, but must demand more than the conception of him as " the energetic hero of a Jewish reform movement." Still, the work of this great scholar will be widely accepted as conclusive. It presents a serious challenge to the Church. To answer it effectively will require, besides equal genius, preparedness to make some concessions. (Christian Origins. By Otto Pfleiderer, D.D. Translated by Daniel A. Huebsch, Ph.D. Authorized Edition. B. W. Huebsch, New York. \$1.75, net; postage, 12 cents.)

It has been repeatedly urged, City especially by the National Government Municipal League, of which the author is the Secretary, that a study of city government rather than that of the National and State governments be used in schools located in cities as the basis of the teaching of citizenship. The city is the first government with which the child comes in direct contact, and often the only one; it is possible to study it in action, as a reality and not merely through books; the city presents a great and vital problem that needs study. In this study the schools can have a part that will be of real value. Mr. Willard has

prepared a simple, practical text-book for school use or home reading, presenting the outlines of the methods of government of American cities, with suggestions for the detailed study of the administration of the particular city where the book is used. (City Government for Young People. By Charles Dwight Willard. The Macmillan Company, New York. 50c.)

Die Hebräer This is a valuable contribution to the elucidation of Hebrew Following the lines laid down by history. Winckler, the author, Dr. Wilhelm Erbt, finds in the Pentateuchal documents pictures of tribal wanderings and the foundation of successive Palestinian States. Especially interesting is the rôle ascribed to Penuel and Shechem—the former as the seat of power east of the Jordan, the latter as the head of a western federation. Abraham is regarded as a Babylonian chief in the north, and Jacob as an Amorite tribe in the east. In the later history account is taken of foreign influence. but events are mainly determined by internal forces, social and religious. Too much is made to turn on the continuous and finally successful struggle to establish the Mosaic Jahweism of the southern tribes, and textual emendations contribute too largely to special views. (Die Hebräer. Von Wilhelm Erbt. J. C. Hinrichs'sche Buchhandlung, Leipzig. Price, 5 marks.)

The Eternal Spring

The absence of plot and incident seems to indicate that it was intended to be a psychological novel; but the absence of any real psychological analysis leaves it doubtful just where to place it. (The Eternal Spring. By Neith Boyce. Fox, Duffield & Co., New York. \$1.50.)

This volume of reminis-Forty Years an cences by the foremost Advertising Agent veteran in the advertising field forms an excellent informal history of the development of the business of advertising from the smallest of beginnings to its position as a great commercial enterprise whose aggregate, measured in dollars, is said to rank next to the banking and insurance business of the country. The book is a mine of anecdotes of publishers, authors, advertisers, and advertising agents, written in a breezy, chatty style. (Forty Years an Advertising Agent. By George P. Rowell. Printers' Ink Publishing Company, New York. \$2.)

Magic
New and Old

A perennial interest attaches to sleight-of-hand tricks. This book begins with the ancient Egyptian magic and comes down to such

modern prestidigitateurs as Kellar and Herrmann. Scores of conjurers' tricks are explained, with abundant illustration. In his introduction Dr. Paul Carus discourses in a readable way about the relations between magic, illusion, and miracle from the point of view of one to whom the miraculous is the impossible. (The Old and the New Magic. By Henry R. Evans. The Open Court Publishing Company, Chicago.)

A large number of novel The Man from readers will remember Mrs. A merica De La Pasture's sincere and simple little story called "Peter's Mother," which, in its way, was one of the best books of last season. The present story is a little less compact and has a little less plot interest. It is also a little slow in getting under way, but when the reader's interest is once aroused he will find it an agreeable picture of English country life, and it is to be heartily praised for the absence of any of that morbidity or cynicism which seems to be so prevalent in recent stories of English society. (The Man from America. Mrs. Henry De La Pasture. E. P. Dutton & Co., New York.)

Mr. Hopkinson Smith's lished books of fiction by Mr. F. Hopkinson Smith have now been added to the very well made and tasteful collective edition of his works called the "Beacon Edition." Both of these have already been commented upon in The Outlook, and we need here only note the unquestioned popularity and graphic interest of both. (The Novels, Stories, and Sketches of F. Hopkinson Smith. Vol. XI., At Close Range. Vol. XII., The Wood Fire

at No. 3. Beacon Edition. Charles Scrib-

ner's Sons, New York. \$1.50 each.)

A gay and rather foolish tale, A Motor-Car supposed to be written by the Divorce young wife, who has a whim for divorce and is humored in it by her husband. The motor-car is "The Means," and her diary is to report faithfully, during a tour on the Continent, all the evidences of incompatible tempers. The effect of innocent gayety is somewhat overdone, and, in spite of the humor of the author, Louise Closser Hale, and the clever drawings by Mr. Walter Hale, the book does not absorb one's attention. (A Motor-Car Divorce. By Louise Closser Hale. Dodd, Mead & Co., New York. \$1.50.)

The Other Mr. Barclay
Mr. Barclay
Mainly a story of Wall Street speculation and manipulation. The passion and fraud engendered by financial war furnish the motive power for dramatic complications and per-

sonal rivalries. The devastation wrought in a sleepy village by one stock gambler who fans the native spirit of greed is forcibly depicted. The author knows his subject and handles it with directness and spirit. (The Other Mr. Barclay. By Henry Irving Dodge. Consolidated Retail Booksellers, New York. \$1.50.)

The Patriots Dr. Brady still writes of love and war. He does not introduce a large variety of types, but one is always assured that the creations of his facile pen will be consistent and perfectly proper for polite society. General Lee is the noble figure put upon a fitting pedestal in this romance of our Civil War. A tangled love affair straightens itself out by the simple device of mismatched lovers seeing their error and turning to their soul mates before it is too late. (The Patriots. By Cyrus Townsend Brady. Dodd, Mead & Co., New York. \$1.50.)

A printer of lower-class England Saints is taken up by the nobility for in Society political uses because of his real talent in speech-making, but fails at the crucial moment. His wife, an almost impossible Cockney girl, rises to the emergency, and her character and taste develop in a The author writes phenomenal manner. with superficial smartness, but fails to impress her readers with the reality of her convictions or the artistic command of her material. The combination of surface inanity and real strength in the high-born characters with true Christianity and selfish ambition in those from the slums is not convincing, though at times the situation becomes interesting. (Saints in Society. By Margaret Baillie-Saunders. G. P. Putnam's Sons, New York. \$1.50.)

This story, which is the work The Scarlet of one of the most reactionary **Empire** of the opponents of trades unionism, is quite naturally a tract against the Socialistic propaganda. It is an account of a visit to the New Atlantis, under the sea, where Social Democracy has been carried to its, to the author, logical conclusion. As a story the book is fairly readable, but as a contribution to the discussion of the social problem it has no slightest claim to consideration. (The Scarlet Empire. By David M. Parry. The Bobbs-Merrill Company, Indianapolis, Ind.)

Thunder and Lightning as a writer of popular (and sometimes, perhaps, a trifle sensational) scientific exposition insures a readable book on what he calls the mysterious habits and customs of thunder and

lightning. He has marshaled here a host of strange narratives of startling phenomena, illustrated by many rather poor pictures, and seems less concerned to explain the marvelous occurrences by recognized laws than to startle the reader and convince him that there is much that is inexplicable in electricity. (Thunder and Lightning. By Camille Flammarion. Translated by Walter Mostyn. Little, Brown & Co., Boston. \$1.25, net.)

The Triumphs of Eugène Valmont

The first one, in which the historical incident of the diamond necklace of Marie Antoinette is carried forward into our own time, is particularly clever. Unlike Sherlock Holmes, Mr. Barr's detective occasionally does make mistakes, and indeed two or three of the best stories in the book are concerned with his failures. (The Triumphs of Eugène Valmont. By Robert Barr. D. Appleton & Co., New York. \$1.50.)

Under the pen-name of Paul The Twentieth Karishka, "a well-known Century Christ jurist," as his publishers tell us, has with a reverent hand drawn what is refracted to him through his predilections as a true portrait of Christ. Jesus is to him the greatest of Masters in philosophy, the teacher of "a philosophy translatable into religion." One of the earliest literary defenders of Christianity, Justin Martyr, in the second century, an enthusiastic Platonist, found his way to Jesus through this gate of philosophy. But here the parallel ceases. Justin found an ethical philosophy in Jesus; what Karishka finds is metaphysical. All great thinkers from Laotze in ancient China to Hegel in modern Germany have taught, and Jesus taught, the everlasting parallelism, " the identity, of contraries," e. g., to the poor in spirit belongs the kingdom of heaven; to lose life for My sake is to save it. "Jesus was wise." He said to himself, How shall I make the wretched multitude understand this law of being, so that they may extract from the bitter the opposing sweet? "I will become cne of them, and demonstrate that suffering in all these forms finds its other pole in joy. So, then, though homeless and poor, "he declared himself supremely happy." Karishka's style is cultured and energetic, but he does not transcend intellectualism into the region of the affections and the will, the proper sphere of Christianity. Even Jesus' expectation of drawing all men to himself through his cross is interpreted as referring

to the triumphant effect of demonstrating Karishka's fundamental philosophic principle. He concludes that Jesus is divine, "both man and God." It is one of the cases in which a conclusion accepted by many is based on grounds plausible to few. But the conclusion is the main thing. And the general complexion of the work is of that type of religious thought which goes further in Asia than in Europe or America. (The Twentieth Century Christ. By Paul Karishka. Lothrop, Lee & Shepard Company, Boston. \$1.10, postpaid.)

The charms of the shiftless Uncle William life are sung in this attractive little story by Jennette Lee. Uncle William is an old philosopher who gets his own way by mere force of his faith in human nature and gentle inertia. His agency in the love story of a pair of young artists is ably reinforced by his boyhood companion, who returns to his old home in the character of a wealthy patron of art. There is a grace in the making of the story that owes its effect to an unstudied simplicity of style. (Uncle William: The Man who was Shif'less. By Jennette Lee. The Century Company, New York. \$1.)

The work of Frederic Rem-The Way ington as an artist in depictof an Indian ing Indian types and characteristic scenes of Indian life is perhaps as well known as the work of any other American painter. In this book he does for the brave with the pen what he has so often done with the brush. It is the life-story of a typical fighting Indian of the West in the days when the white man was beginning to overrun his country. It is written from the Indian point of view, and is vivid, picturesque, and truthful. The book is illustrated with fourteen of Mr. Remington's remarkable Indian pictures. (The Way of an Indian. By Frederic Remington. Fox, Duffield & Co., New York. \$1.50.)

Wild Justice

Short stories of life in the islands of the South SeasThe characters are the ignorant and superstitious natives, well meaning but generally inefficient missionaries, unscrupulous traders, and refugees and adventurers in search of victims. It is not an edifying life, and the manly virtues seem to be conspicuously absent. There is a certain bizarre humor, however, in these tales which somewhat redeems the sordidness of their subject matter. (Wild Justice. By Lloyd Osbourne. D. Appleton & Co., New York. \$1.50.)

Letters to The Outlook

LIBERTY AND THE CLOSED SHOP

I notice that in your editorial answer to my article on Nuremberg, the City of the Closed Shop, you say, "The closed shop, as Mr. Bliss describes it, was wholly inconsistent with industrial liberty." But this is exactly what you do not prove, and what I most emphatically deny. I think the trouble is that you do not define "liberty." It is very seldom defined. I have read scores of books of reformers and publicists who talk about liberty, but scarcely one book defines it. What is liberty? Lack of law? So you and most writers unconsciously assume. If so, you are right. There was no liberty in Nuremberg. But is liberty lack of law? You do not so believe. No philosophic mind claims that to-day. Liberty is opportunityopportunity to think one's own thoughts, to dream one's own dreams, to do one's own deeds, to live one's own life, to be one's own self. Few will deny that that is liberty.

Now, so defined, where is this liberty? I believe that in Nuremberg, for a boy born poor, a boy of the working class, there was almost infinitely more liberty-more opportunity to become a creator, an artist, to live his own life, to be himself—than there is for a boy so born in Fall River or Birmingham to-day-in both cases barring accidents or favoritism. It is true that the non-union man is free to hustle and push and shove his comrades as the union man fortunately cannot do. So the non-moral man can do some things that the moral man may not do. But morality is not slavery and immorality is not freedom. The closed shop closes the door on the struggle to down one's comrades, but it opens the door to opportunity to rise to the higher manhood. Exactly because. as you say, manhood is more than things, and to be free is more than to be rich, I believe in comradeship and the union shop. I used Nuremberg as an illustration, not to be copied in all things, but to show how the closed shop gave opportunity and produced W. D. P. BLISS. men.

CREEDS AND UNITY

Some time ago you commended the proposed union of the Congregational, Methodist Protestant, and United Brethren Churches. And what a fine thing it is! But does not the proposal to tag on a "Declaration of Faith" as a part of the basis of union seem to you an opportunity-missing mis-

take? Such a proposal implies that it is still impossible for Christian people to unite simply and strongly as disciples of Christ, acknowledging, in a truly personal way, allegiance to him as the truth and life of God. So we are asked to repeat once more the old folly of trying to pack our "faith" into a theological formula, and then hasten to explain that we do so as an "act of worship," and that this theological child of ours must not be measured by the test of accuracy—a test which, one would think, should be among the foremost of those that theological statements would in these days expect to meet.

It may seem to some that the conclusions of a committee of so able men with so excellent an aim should not be criticised. Yet this is not the way truth has grown among us, nor is permanent and vital union likely to be promoted by such silence.

Is it true that in our Congregational churches, or in any group of churches, union for worship, life, and service should be based on theological propositions of any sort rather than on personal devotion to God in Christ? The Committee say that they are "possessed of these convictions both as truth which they do most firmly hold, and acts of faith which spring from their hearts." Are not religious faith and theological doctrine far too important to be confused in this way?

Is it true that a declaration of the theological belief of any man or set of men as to the "ancient symbols of the Church," the resurrection of Jesus, immortality, or baptism, is an "altogether necessary" part of a genuine "avowal of personal consecration to the will and service of God in Jesus Christ our Lord"?

Again—a far less important, yet not unimportant question—Is it true that such statements as that we accept "the Holy Scriptures [rather than the teachings of Christ] as the inspired source of our faith and the supreme standard of Christian truth," and that we "consent to the teaching of the ancient symbols of the undivided Church," are representative of the truth as held by Congregational Christians? Some of the very men whose names are attached to this doctrinal announcement have substantially denied one or both of these propositions in their oral or written teachings.

It is a long road we are traveling in this search for truth, and each decade finds us in a different stage of the journey. If the com-

mittee had only been content with some such statement of loyalty as that of the first lines of their Declaration, and had added a pledge of unity and obedience in Christian service, they would have seized a fine opportunity for advancing the only abiding and really fundamental unity—the unity of the Spirit.

G. H. B.

[With the protest against creeds as conditions of entrance to the Church The Outlook is in sympathy. But this protest is very apt to swing over into an attack on creeds as such. Such an attack seems to us as futile as it is unjustifiable. So long as men have religious convictions, so long will they wish to give them intellectual form. If the creed upon which representatives of these three denominational bodies have agreed measurably expresses their common convictions, and is not to be used as a barrier against those who do not wholly agree with it, we can see only reasons in favor of it. A creed as a test is wrong; a creed as a testimony helps to clarify convictions and to assist men and churches in discovering what convictions are fundamental.—THE EDITORS.]

MINE LABOR CONDITIONS IN WEST VIRGINIA

The editorial paragraph in the issue of The Outlook for March 17 on "Mine Labor Conditions in West Virginia" is misleading; not so much on account of what is said, as from what remains unsaid.

It is true that West Virginia coal is a strong competitor against other coals, anthracite as well as bituminous, in both Eastern and Western markets; that it affects the entire coal industry of the country and is a factor that must be reckoned with by all parties in interest to a miners' strike; and that this situation is of the most vital concern to the general public. It is not true, however, that, "through various means of exploitation of labor, the labor cost of producing coal is much less in West Virginia than that of the operators in the Middle Western coal-producing States having a common market."

That coal is mined much cheaper in West Virginia than it is in the Middle West is a well-known fact; but it is not because of the "exploitation of labor." The paragraph under discussion correctly gives the reason why West Virginia coal finds its way to both Eastern and Western markets as being on account of its favorable location in the mountains, half-way between the ocean and the lakes, thus making practicable a down-grade haul each way. It cannot be said that the natural advantage of location over Western coals is due to the "exploitation of labor;" neither

is the small labor cost of mining West Virginia coal attributable to low wages paid miners, but is likewise the result of favorable natural conditions. A miner can mine more coal in the average West Virginia mine than he can mine in the average Western mine, for the reason that the seams of coal are much thicker in West Virginia than they are in Ohio, Indiana, and Illinois, and are almost universally worked from drift mouths rather than by shafting, which is the common method in the Middle West. Thus coal can be mined cheaper in West Virginia than elsewhere, for the reason that nature placed it so that a miner can get it out with the minimum of effort. This makes possible large daily wages to the miner and at the same time small cost per ton to the operator. A miner can make more per day in the principal mining districts of West Virginia than he can anywhere else with a like amount of effort, and this because of the ease with which coal is mined. It is not uncommon for a miner in the Pocahontas coal fieldwhich is the largest and most important mining district in West Virginia-to go into a mine and make ten or twelve dollars digging coal before he comes out. This is not done in any other coal field in the United States.

It should always be borne in mind, too, that the time a miner spends in a mine in the Pocahontas field depends absolutely on his own volition. He begins and quits when he pleases, and the operator does not say a word, and dares not, for the reason that if he did, and the miner should not like it, all the miner would have to do would be to move on to a neighboring operation, with conditions equally favorably and a place to work awaiting him. So it is the custom in this district for miners to work one hour or twelve out of the twenty-four, just as they please, and one day or seven of the week, as they may choose. The question of an eight-hour day does not interest the West Virginia miner. He does not work that long now, on an average, and vet is making more than his brother miners less fortunately situated in other fields, who are clamoring for shorter hours of work. If statistics show that miners make more money per month or year in other States than they do in West Virginia, it is because those miners work more regularly than do the West Virginia miners, and not because they receive more for labor actually performed. And if miners in other States have more material comforts than do those in West Virginia, it is because those miners spend their earnings for such things, and not because West Virginia miners are unable to do so on account of the "exploitation of labor."

In the two things most coveted by miners by all men-liberty to work and good pay for labor performed, West Virginia leads all other States, as she does in the production of coal, except Pennsylvania. If the miners are indolent and do not work regularly, or spend their substance for that which is not meat, it is in spite of the operators and not because of them. There is not a mine in the State where miners may not receive regular employment at equal or better wages than could be earned under similar conditions of mining in other States; and there is not an operator in the State who would not prefer that his miners spend their money for things of real worth to themselves and families, rather than for drink and in sports that kill, as is so often done.

The coal production of West Virginia has increased from five million tons (in round numbers) in 1890, to thirty-eight million tons in 1905. This remarkable increase is due, not to any "exploitation of labor," but to the natural conditions so favorable to mining, and to the superior quality of the coal, which insures it a ready market wherever introduced. The United Mine Workers of America have never been able to control to any great extent in West Virginia, for the reason that the miners do not feel the need of the organization, but are able and content to get along without it. So a strike of the Mine Workers does not seriously affect the production of West Virginia coal.

That West Virginia miners live and work under the actual conditions guaranteed to them by the State motto, "Montani Semper Liberi," instead of being a menace to the general public, guarantees to it that, no matter how strong may be the tie-up by a strike in other fields, West Virginia will continue to furnish abundance of coal of a quality rivaled only by the celebrated coal of Cardiff.

L. C. Anderson.

Welch, West Virginia.

AN EXCELLENT WORK

In your advocacy of all good causes will you introduce a word for the Berkshire Industrial Farm? It has been in existence for nineteen years, and during that time more than six hundred wayward boys have been reformed under its influences, and have gone out into life, most of them with a manly purpose to earn an honest living and to be self-respecting citizens. Out of a hundred letters received from these boys during the past year not one has asked for pecuniary aid,

and all have expressed attachment and gratitude to the Farm.

The physical condition of the boys during these nineteen years is worthy to be placed on record. Coming, as most of them do, from poor homes and a street life, with health impaired by cigarette-smoking and evil habits, they have uniformly improved under the influence of the pure mountain air and water, plain, wholesome food, plenty of exercise, and constant occupation for mind and body, so that in a population of eighty boys no contagious disease has occurred and no affection of the eyes or skin.

There has been one serious case of illness, in which the patient recovered. Are there many schools that can show such a record in nineteen years?

The boys receive a good common school education, half the day being devoted to study and half to work or play. Those who could not read or write when they entered are able to write a creditable letter, correctly spelled and expressed in good English, when they leave. All the boys are brought forward to the higher branches according to their ability. Particular attention is paid to natural history and to exploring the woods and mountains in search of plants and flowers.

The work most popular among the boys is in the machine shops, where an accomplished machinist trains them to earn tolerable wages as helpers in various trades when they leave. The printing office turns out excellent printers, who have no difficulty in finding situations.

Carpentry, house painting, and mason work are also taught. The large farm is worked by the boys under the instruction of a competent farmer, and many, on leaving, find employment on farms in the neighborhood.

The moral and religious tone of the Farm is very high; no teacher is chosen without special reference to his influence over the boys continually under his care. With small salaries and an isolated life, the teachers love the work, and remain year after year, often returning if they go away, with the feeling that they cannot leave the boys.

Mr. Joseph H. Choate in a recent letter says, "I visited the Berkshire Farm with Sir Arthur Wells last summer, and we were both much pleased with its excellent condition; he as an expert and I as an amateur."

The Farm is almost entirely dependent upon charity. The Treasurer is Mr. Robert C. Lewis, Lincoln Trust Company, New York City.

The Bride's Grousseau

This is the title of a dainty booklet which we have just issued

in which is discussed this most interesting subject.

For over half a century we have been supplying what is best in Housekeeping Linens to the best people of the land. To-day we are preparing Housekeeping outfits for the third generation of some of our former patrons, and, since the addition of the Pansy Corset and Underwear Department, we are equipped to supply this more personal part of the trousseau as well. Our long experience in preparing Bridal Outfits has made us very familiar with all the details of importance connected with the successful completion of a Bridal Outfit.

The booklet illustrates a variety of Housekeeping Linens, Ladies' Underwear and Corsets, and gives detailed estimates of Trousseaux costing from \$100 to

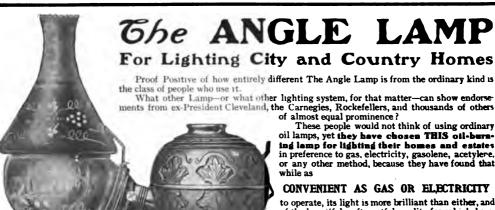

\$2.500 each.

We shall be glad to mail this booklet free on request,

☻

The general sus-Arbitration in the pension of coal-Mine Labor Controversy mining by members of the United Mine Workers of America, which was inaugurated on April 2 in both the anthracite and bituminous fields, closes its third week with more than three hundred thousand mine employees still idle. Of this number about one hundred and sixty thousand are in the anthracite industry of Pennsylvania, and the remaining one hundred and forty thousand are idle in Arkansas. Indian Territory, Illinois, Indiana, Iowa, Kansas, Michigan, Missouri, Ohio, Pennsylvania, and West Virginia. In Alabama the strike inaugurated more than twenty months ago continues to affect four thou--sand men. In Illinois, Indiana, Indian Territory, Missouri, Ohio, Western Pennsylvania, and West Virginia settlements have been effected with operators by which some of the mine workers in these States have resumed mining operations, and the prospect is that as soon as other operators in these States dispose of their surplus coal now on hand a still larger number of settlements by districts will Within a month at most, officials of the United Mine Workers believe the suspension will be terminated in nearly all of the bituminous fields through district agreements between officials of the union and representatives of the operators. In Arkansas, Iowa, Kansas, Michigan, and Central Pennsylvania practically the total number of mine employees in those districts continue in idleness. Since the inauguration of the suspension the operators of the central competitive territory of Western Pennsylvania, Ohio, Indiana, and Illinois, who in the Inter-State Joint Conference refused to accede to the compromise wage increase demand, have appealed to President Roosevelt for the appointment of a commission to investigate and settle the differences between

them and the mine workers. They ask for an investigation by the commission of all matters which in its judgment have an important bearing upon or relation to the scale of wages which should be paid to all classes of labor in and about the coal mines of these four districts, as well as an investigation of other conditions insisted upon by the United Mine Workers. The resolution asking for such a commission declares the inability of the operators to come to terms with the miners, and claims that such operators represent eighty per cent, of the production in the central competitive territory. To this statement President Mitchell, of the miners' union, and Mr. Francis L. Robbins, of the Pittsburg Coal Company, which led the operators who accepted the compromise wage increase, take exception, claiming in a telegram to the President that at least one-half of the tonnage of the four districts mentioned is produced by operators who are willing fo pay the compromise scale. Mr. J. H. Winder, the leader of the operators who oppose the compromise wage increase, has supplemented the appeal to President Roosevelt with a proposition to President Mitchell that the differences be referred for determination and settlement to a board of arbitration to be composed of the members of the Board of Conciliation provided for in the award of the Anthracite Coal Strike Commission, with Judge Gray or any person he may appoint to act as chairman and umpire. This proposition is shortly to be acted upon by the National Executive Board of the United Mine Workers.

@

Anthracite Conferences
Fail to Reach an
Agreement

In the anthracite industry an early resumption of coal mining is not

probable. The various conferences between representatives of the operators

Digitized by Google

and mine employees have been terminated without any agreement. operators on March 9 refused all the original demands of the anthracite mine employees, and presented a counter proposition to the effect "that the awards made by the Anthracite Coal Strike Commission and the principles upon which they were established by the Commission, and the methods established for carrying out their findings and awards, shall be continued for and during a further term of three years from the first day of April, 1906." In reply to this proposition President Mitchell declared that there has been criticism among the miners; that there exists much cause for criticism and complaint: and that this is true to such an extent that the miners cannot, with any degree of contentment or satisfaction, continue to work under present conditions. On April 3 another conference of operators and mine employees was held in New York, the suspension in the anthracite coal fields of Pennsylvania having become effective in the meantime, at which the mine workers proposed that the differences at issue be submitted "to a board of arbitration composed of the members of the present Board of Conciliation provided for in the award of the Anthracite Coal Strike Commission, with Judge George Gray or any person he may appoint to act as chairman and umpire; the decision of the tribunal or of the majority of the members thereof, in so far as it influences wages, to be effective from April I, 1906, and to continue in force until March 31, 1908, such decision to be final and binding upon all parties in interest." This proposition was declined by the operators, who in turn proposed submitting to at least a majority of the members of the Anthracite Coal Strike Commission the question "whether any changes in the conditions of the anthracite industry have occurred" since the award of the Commission in 1903 which require that the award should be modified as to wages of the employees, or the adjustment of complaints through the Conciliation Board or otherwise. Objections to the acceptance of this proposition on the part of the mine workers were pre-

sented at the final joint conference on April 11, and at the same time the committee representing the anthracite mine employees altered their original demands to the extent of withdrawing that for recognition of the union and modifying that for the establishment of the check-off system so as to provide for the collection of union dues from those employees only who gave such authorization. In case the miners' original demands, with these modifications, were unacceptable to the operators, President Mitchell, on the part of the hard-coal miners, agreed to accept the proposition for submitting the issues to the Coal Strike Commission, provided that, in case any members of the original Commission were unable to serve, the vacancies were to be filled by President Roosevelt. To this final reply of representatives of the anthracite mine employees the operators have made no definite answer at this writing; and this is the situation in which the negotiations have been left, the suspension of hard-coal mining continuing. But a convention of the three anthracite districts is being arranged by officials of the United Mine Workers of America, to which a complete report of the negotiations with the operators is to be presented. Upon the action of this convention depends the decision whether the present suspension is to become a strike or is to be terminated by a resumption of mining operations. The effect upon the consumer of hard coal of all these negotiations has not only been to prevent the customary April reduction of fifty cents a ton on domestic sizes of anthracite, but also has resulted so far in a general increase of at least twenty-five cents a ton over the usual price of \$6.75.

Just and Unjust
Mortgage Taxation
The passage of the Dowling mortgage tax bill at Albany recalls some significant and in certain aspects amusing taxation history. For many years in New York State mortgages have been subject simply to the regular personal tax. The Outlook has often pointed out that this method of taxation has been unjust, for two reasons: first, it was a method of double taxation, as it

extracted tax payments on the same piece of property both from the mortgagor and the mortgagee; and, second, it was so generally evaded, especially in the large cities and by wealthy mortgageowners, that the entire tax was practically paid in the rural districts, where the mortgage-holders could not technically evade or willfully deceive the tax offi-Moreover, the few conscientious taxpayers, and the much larger body of unfortunates who desired to evade the law but could not do so, had to pay a tax of from one and one-half to two per cent. on mortgages that were only bringing a return of from four to six per cent. Two years ago the Bostwick bill proposed to substitute a nominal recording fee for the personal tax on mortgages. The ordinary citizen would have supposed that the replacement of an annual tax of one and one-half per cent. by a recording fee of one-half per cent., paid only once, would have been welcomed by all lenders and borrowers of money on real estate. This was not the case, however; the admirable I ostwick bill was defeated by the influence largely of wealthy men in New York City, who preferred to own their mortgages subject to the annual tax of one and one-half per cent. which they never paid, rather than subject to a fee of one-half per cent, which they would be compelled to pay in order to make their mortgages worth anything. So the old system went on until the citizens of the so-called rural districts found their burden intolerable to bear. justly saw no reason why New York mortgage-owners should be practically tax free while they paid one and onehalf per cent. The "up-State" counties, with the approval of Governor Higgins, succeeded, therefore, in putting through the Legislature last June a mortgage tax bill providing for an annual tax of onehalf per cent. Taxation under this law began on July 1 last. The framers of this law were astute enough to make provisions of such a nature that owners of mortgages who evaded or dodged this tax were in danger of having their mortgages canceled. Confronted with the absolute necessity of paying one-half per cent. a year, the real estate interests of

New York City began to regret exceedingly their defeat of the Bostwick bill, and they practically said to the rest of the State, If you will give us another chance we will accept the recording tax. This has now been enacted in the Dowling law. Under the Dowling law. which now simply awaits the Governor's signature, all mortgages are to pay a tax of fifty cents on each hundred dollars at the time they are recorded, and are exempt from any other form of local or State taxation. The recording tax is likely to bring to the State a very much larger income than the old and often uncollectable personal tax law, although not so great an income as the one-half per cent, annual tax, both of which forms of taxation it supersedes. But it does away with the injustice of double taxation imposed by any annual tax, and its burden is not likely to fall on the small borrower. The Outlook regards it as a distinct step in advance, although the history of its passage manifestly exposes a large body of the mortgage owners and dealers of New York City to the charge of having been wholesale evaders of law.

The readers of The Help to Save Outlook may render val-Niagara Falls uable personal service toward the saving of Niagara Falls by sending immediately to the Committee on Rivers and Harbors of the House of Representatives, Washington, D.C., their support of the bill which was introduced last Wednesday by the Hon. Theodore Burton, of Cleveland, Chairman of this Committee, with the approval of President Roosevelt. The complete bill is printed herewith:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the diversion of water from Niagara River, in the State of New York, is hereby prohibited, except upon revocable permits to be granted by the Secretary of War in accordance with section two of this Act: *Provided*, That this prohibition shall not be interpreted as forbidding the granting of permits by said Secretary for domestic uses, or for such diversion of water as may, in his judgment, be required for the Erie Canal for purposes of navigation. Sec. 2. That the Secretary of War is

hereby authorized to grant revocable permits for the diversion of water from said Niagara River for the creation of power, but only to individuals, companies, or corporations which are now actually producing power from said water, and to them only to the amount now actually in use by such individuals, companies or corporations.

nies, or corporations.

Sec. 3. That the transmission into the United States from the Dominion of Canada of electrical power generated from the waters of the said Niagara River or from any of its tributaries is hereby prohibited, except to the amount now brought into the United States from Canada, and the Secretary of War is authorized and directed to ascertain such amount and to make regulations preventing or limiting the further admission of power as herein stated.

Sec. 4. That any person, company, or corporation violating any of the provisions of this Act, or any rule or regulation made by the Secretary of War in pursuance thereof, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not exceeding two thousand five hundred dollars nor less than five hundred dollars, or by imprisonment (in the case of a natural person) not exceeding one year, or by both such punishments, in the discretion of the court. And further, the removal of any structures or parts of structures erected in violation of this Act, or any construction incidental to or used for such diversion of water or transmission of power as is herein prohibited, may be enforced by the order of any circuit court exercising jurisdiction in any district in which the same may be located, and proper proceedings to this end may be instituted under the direction of the Attorney-General of the United States.

Sec. 5. That the President be requested

Sec. 5. That the President be requested to take such action as he may deem necessary, either through ordinary diplomatic channels or by the members of the International Waterways Commission appointed in pursuance of the river and harbor Act of nineteen hundred and two, and acting in conjunction with the members of said Commission representing the Dominion of Canada, to prevent the further depletion of the waters flowing over Niagara Falls and for the adoption of proper regulations to preserve the said cataract as near as may be in its natural condition.

Sec. 6. That the provisions of this Act shall remain in force for three years from and after date of its passage, but nothing herein contained shall be held to establish or confirm any rights heretofore claimed or exercised in the diversion of water or the transmission of power.

mission of power.
Sec. 7. That the right to alter, amend, or repeal this Act is hereby expressly reserved.

The lines are now sharply drawn between those who wish to exploit Niagara Falls for commercial purposes and those who are determined that its scenic beauty shall be preserved. The people will win if they make their wishes known.

New York Rapid Transit The Elsberg Bill, which has passed the New York Legislature and now re-

quires only the approval of the Governor of the State and the Mayor of New York City to become law, marks another victory in enlightened dealing with franchise questions and transportation problems. Though the language of the bill at various points is complicated and obscure, not to say ambiguous, its general provisions are clear enough. The bill has been radically amended since its introduction. and now embodies some of the best features of the measure proposed last February by the City Club. In the first place, it allows the Rapid Transit Commission discretion in deciding whether contracts for the building of a subway shall be made with one firm and for the operating of it with another, or whether contracts for building and operating shall be made with the same firm. With this increase in freedom in one direction the Commission loses freedom in another; it is deprived of the power to grant perpetual franchises except to trunk lines running into the city. In granting franchises, moreover, the Commission is limited to a period of twentyfive years, with a twenty-year renewal, and can fix the rental price for only the twenty-five-year period; thereafter there must be, we understand, readjustments from time to time. At the end of the period of franchise the whole road—except the rolling stock and other movable equipment—shall become the property of the city without further compensation; and the rolling stock, if the Commissioners so provide in the franchise, may become the property of the city upon a fair valuation. As a last resort, the Rapid Transit Commissioners are empowered to maintain and operate a road or roads in behalf of the city. In other words, the Legislature authorizes municipal operation. Not the least important provision is that which changes the Board of Rapid Transit Commissioners from a self-perpetuating body to one whose members are

hereafter to be appointed (as vacancies occur) by the Mayor. Heretofore the Board has done admirable service; but a self-perpetuating public board is wrong in principle and is subject to the danger of becoming in every sense unrepresentative. Its transformation into an appointive board is to be commended. It is hardly necessary to say that the principles which the Elsberg Bill embodies are, in the judgment of The Outlook, sound.

❸

The Long Arm of Justice

The conviction in Savannah last week of John F. Gaynor and Benjamin D.

Greene on a charge of defrauding the United States Government is a striking reply to those who distrust justice and believe that rich rogues go free. Judge Speer, in sentencing these men to four years' imprisonment and to fines of over half a million dollars each, enforced this lesson by these words: "I am told that it has been cynically said by a famous New Yorker that no man who has a million dollars can be convicted of crime in America. The verdict of this jury of plain, clear-sighted, honest Americans has falsified such pessimism." And in concluding his sertence Judge Speer fitly quoted the words of the Psalmist, "The little that a righteous man hath is better than the riches of many wicked." One of the men convicted, as Judge Speer pointed out, has been a man honored by a great political party, the other a West Point graduate of distinction. The fines, which equal the amount embezzled, may very likely not be paid, for in cases of this kind the convicted men may take a sort of poor debtor's oath and perhaps thus avoid restitution, but in that case an additional month's imprisonment must be served. It may even possibly happen that the present conviction may be reversed after appeal proceedings. even so, it will always stand as a vivid illustration of the efficiency and honesty of the law and its administration that these charges have been relentlessly followed up for six years, during which the accused are said to have spent two million dollars in avoiding trial; that every subterfuge has been used in vain

by the ablest counsel for the defense; that flight from the country was useless; that a long struggle against extradition ended in defeat; that desperate expedient and lavish expense failed; that these men, accomplices and financial backers in the engineering frauds of Captain Carter, who had already been convicted and imprisoned, were brought to trial, millionaires though they were, fairly dealt with by judge and jury, and duly convicted and sentenced. If the mills of justice have ground slowly in this case, they have certainly ground surely.

260

The immense growth in The House the amount and intricacy Office Building of the public business of the United States is indicated by the necessity of an office building for each branch of Congress. That which is to be used by the House of Representatives is now under way, and its corner-stone was laid in Washington last Saturday with interesting ceremonies. The most noteworthy event of the day was, of course, the delivery by President Roosevelt of his address entitled "The Man with the Muck-Rake," which is reproduced in its entirety elsewhere in this issue of The Outlook, and is commented upon editorially on another page. There was a great assemblage of high officials and distinguished guests at the ceremony, including the members of both Houses, the President and Vice-President, the Supreme Court, and many foreign diplo-The Masonic ritual in all its interesting details was carried out (as is often the case with the corner-stone laying of public buildings, because of the aptness of the ritual and the supposed ancient origin of the society among operative masons), and the gold-mounted gavel used was that employed by George Washington when he presided as Masonic Grand Master at the laying of the corner-stone of the Capitol in 1793. The Office Building. which stands near the Capitol at its southeast corner, is to cost something over three million dollars, has a total frontage of nearly one-third of a mile, has a large interior court, will have three stories above the ground level at the front and five at the rear, and will contain no fewer than 410 offices, together with a large assembly-room where public hearings may be had before House committees. The intention is to furnish each member of Congress with a room in which he may conduct public business and receive his constituents. When the entire architectural plan contemplated for enlarging the business facilities of Congress is completed, the National Capitol will be increased in dignity of outward appearance as well as in interior spaciousness.

(A)

Railway Regulation
in Mexico
While the question
of railway regulation
by law is before the

by law is before the public, it is interesting to note what has been done along this line in other countries. Probably the railroad law of Mexico is as just and as advanced as that of any other country, and accordingly is worthy of study. It is made to apply to the transportation companies from the time of their application for a charter, and thus the companies and their officials are subject to the special laws through all the periods of their companies' growth. It is evident that there has been an honest effort on the part of the Government to take a fair attitude toward both the railroad companies and the public. The construction of railroads has been aided by means of subsidies, secured by Government bonds, which go far toward paying the costs of construction. The amount of the subsidies varies with the nature of the country crossed by the line and the Government needs of the particular line. Construction is further aided by the Government remitting the duties levied by the country's protective tariff on the materials of construction. The operation of the roads is encouraged by permission to form pools to direct shipments and apportion business, but the nature of these pools is scrutinized and must be approved by the Government, so that the roads are not able to raise prices and rob the public. Railroad operation is again encouraged by the law preventing the construcion of unnecessary parallel lines, or those built for speculation. The friendly attitude of the nation toward

the railroads was plainly shown at the time of the passage of the recent money law by which the country's currency was placed on a gold basis, with the Mexican peso fixed in value at fifty cents gold. The passage of this law was urged by the railroads, which had been for years receiving their earnings in pesos varying in value from, say, thirty-five to fifty-five cents, and purchasing supplies and paying bond interest, etc., in dollars of fixed value of one hundred cents. The interests of the people at large and the Government have been well guarded in this law, as in the matter of rates. freight and passenger rates are required to be approved by the Government and to be made public. The rates are subject to revision and approval every three years, at which time the Government may insist upon reductions in rates of as much as ten per cent., provided the railroads are guaranteed an increase in business equal to the average that has been maintained during the preceding five years. The rates for Government business may not exceed one-half the published rates, and all mail matter and postal officers are to be carried without any charge whatever. Rebates and special rates of any kind are forbidden, as well as ticket scalping, and penalties are named which are sufficiently severe to be respected. One of the most interesting provisions of the law is that which provides that at the end of ninety-nine years from the time of granting the concession the real property of the company reverts to the Government absolutely, while the rolling stock, appliances, etc., may be purchased at a fairly appraised At such time the Government may operate the roads or lease them again on favorable terms. It is most interesting to add that the law, too briefly outlined above, appears to be carefully obeyed by the railroads and impartially enforced by the Government.

6

The Eruption of Vesuvius

As last week wore on hope grew that the present outbreak had passed its most violent stage, and attention has been focused on the relief of the destitute thousands who have been

driven from home. The King and Queen have visited the injured, have contributed liberally to their needs, and have incited the authorities to activity and encouraged the frightened and disheartened. The Government is distributing temporary relief, but voluntary contributions from the world at large are needed. In this country the American National Red Cross will collect funds for the purpose; contributions may be sent either to the National Red Cross Treasurer at Washington or to the treasurer of any of the State branches—for New York the address is Jacob H. Schiff, Treasurer, Room 509, No. 500 Fifth Avenue, New York City. While it is evident that some of the earlier reports were exaggerated and incorrect in certain particulars, it is estimated that some five thousand houses have been destroyed, and that the agricultural losses alone may amount to a million dollars. loss of life was greatest at Ottajano, where several hundred people perished. An indirect result of the eruption was the disaster at Naples on Tuesday of last week, when the roof of the Mount Oliveto Market, overweighted by accumulated ashes, collapsed, killing some twelve or fifteen people and injuring about a hundred. At one time there seemed danger of a panic in Naples, but public fear became quickly allayed as the showers of ashes and red sand, which covered the streets lightly, diminished and ceased. The heroism of Professor Mattucci, the director of the observatory on Vesuvius, has attracted wide admiration. In our account last week we repeated the cabled statement that he had been forced to abandon his post. report was quite incorrect; Dr. Mattucci staved throughout, and at the imminent risk of his life, at the observatory, and under the most terrifying conditions watched the progress of the phenomena and sent messages of encouragement and sympathy to Naples. His services to science and humanity will undoubtedly be recognized by the Italian Govern-To a newspaper correspondent who reached the observatory at some risk on Saturday Dr. Mattucci said:

Compared with other great eruptions, this is one of the most important in the history of

Vesuvius. Its effects are less terrible than those of the eruption in the year 79, when Pompeii was buried, but it equals in intensity the great eruptions of 1631 and 1872. What results this eruption will yield to science is not yet certain. You cannot count on Vesuvius; each of its eruptions has its characteristics. This one was marked by an abundance of electrical phenomena.

The statement on Saturday that six thousand persons were engaged in clearing the ashes from the roofs and streets of Naples indicates the effect of the eruption at a distance, and it is even reported that ashes from Vesuvius descended in Switzerland.

A Spectacular Vacation

President Castro, of Venezuela, is accustomed to act with a view to theatrical effect. It is not surprising to find that the news of his retirement from the Presidency cabled last week means

the Presidency cabled last week means merely that his intention is to take a three months' vacation in the State of Araqua. It is open to question whether his motive is purely one of rest, or whether he prefers to be away because he expects that Venezuela may soon be put in a humiliating position by France, which has by no means forgotten its intention of requiring a satisfactory explanation of the treatment of M. Taigny and of other conduct regarded as unfriendly to France. It seems that the law of Venezuela requires that when the President goes outside the Federal district he must appoint as his temporary successor the First Vice-President. General Gomez. an ambitious and warlike man, becomes accordingly Provisional President of Venezuela, but the shrewd Castro has put the military force around Caracas under command of General Araujo, a rival of Gomez, and has sent a large part of the army with generals supposed to be friendly to Gomez far away from the capital under the pretense of military maneuvers. Thus the not unlikely event of a revolution is guarded against, and Castro may safely absent himself. His farewell proclamation asserts that " Peace is assured in the entire republic; the international situation of the Government is clear, as all pending questions will either be amicably arranged or

settled by arbitration "—a statement hardly confirmed by Paris despatches.

Americans who have been An English behind the scenes, so to Scholar speak, in the British Museum know what a wealth of literary material of every sort and kind and of literary association is preserved in that center of English knowledge and scholarship. The books on the shelves, if placed side by side, would extend more than forty-nine miles; and the imagination cannot conceive of the richness of experience, history, scholarship, and poetry compacted and conserved in those volumes. Many scholars have lived and died in the atmosphere of the Museum, and many other scholars have worked in its great reading-room. Among the first must be counted Richard Garnett, who died in London on Friday of last week in his seventy-first year, and whose name brings with it the aroma of the quiet life, the simple habits of good, old-fashioned scholarship. Like Johnson, he was born in Lichfield, and, like the author of "Rasselas," he had a chance of tumbling about in a library as a little child; for while Johnson's father was a bookseller, Garnett's father was a keeper of printed books in the British Museum. The boy entered the Museum in his seventeenth year as junior assistant, and remained in the service of the institution until 1899. His whole active life, therefore, was spent under its roof and among its treasures. His position for many years was that of Assistant Keeper in the department of printed books, as his father had been before him, but he later added to this position that of superintendent of the reading-room; and in 1890 he was promoted to be Keeper of Printed Books. During the eleven years succeeding 1881 he edited the Museum catalogues, a difficult task which he discharged with conspicuous ability. His access to books, the thorough training which his innate love of literature had received, and the range of his tastes, were indicated by many volumes which came from his hand. He wrote lives of Carlyle, of Emerson, of Milton, translated poems from the German, collected

"Relics of Shelley," "Sonnets from Dante, Petrarch, and Camoëns," wrote a "History of Italian Literature," a collection of "Essays in Librarianship and Bibliography," a volume of "Essays of an Ex-Librarian," a delightful book on "William Shakespeare, Pedagogue and Poacher," and he was the editor, in collaboration with Edmund Gosse, of the important illustrated history of English literature published during the last five years. He was a constant contributor to the important biographic works and encyclopædias of the time, and a member of many literary and learned societies. In the rush of modern life and in the heart of the greatest of modern cities Richard Garnett stood for the traditions and sound methods of the scholar's career.

Nathaniel Southgate Shaler Versatility is not the trait one expects to find nowadays in

men of science, and imagination is not commonly regarded as an essential attribute of the scientific mind; yet if there were two qualities for which Professor Shaler, of Harvard, who died last week. was conspicuous, they were his versatility and his imagination. He was by profession a geologist; but he rendered by his avocations as great a service to his time as he did through his vocation. The man who wrote one of the best of the series on American Commonwealths; who in his two volumes "The Citizen" and "The Neighbor" produced most thoughtful studies respectively in democratic politics and racial problems: who published a five-volume drama in blank verse entitled "Elizabeth of England;" who by his book "The Individual: A Study of Life and Death," contributed to the modern discussion of the human soul and of immortality, was more than a scientist. And in his special department of geology he exercised those qualities of imagination and wide human interest which made possible his adventures in other fields. For years the most popular course in Harvard College, hardly excepting Professor Norton's lectures on Fine Arts, was Professor Shaler's course which many graduates remember by the name of N. H. 4 (course

number four in natural history) and later graduates know as Geology 4. Though its popularity was due in part to the fact that it was a "snap" course, in other words an easy one, it was due in larger measure to Professor Shaler's brilliancy as a lecturer, to his humor, and to the moral stimulus of his rugged, genuine character. Dean Shaler's saying which Dean Briggs recalls, "I hold it a part of my business to do what I can for every wight that comes to this place," explains a great part of his power at Harvard. He was a standing refutation of the notion that in a large university the relation of the undergraduates to the most eminent among the professors is necessarily impersonal. Students who years ago took his course may now have forgotten all they ever knew about glacial action and may be unable to define a "fault," but they have not lost the power he gave them of detaching themselves for a while from the habit of thinking in terms of minutes, days, and years, sufficiently to conceive of the transitoriness of all mountains and the instability of continents. "A brief time, geologically speaking," became among the students in his course a proverbial phrase. As Dean of the Lawrence Scientific School he was a forceful administrator, carrying out his policy with great determination. Nathaniel Southgate Shaler was born in Kentucky in 1841. In the Civil War he was an officer in the Federal army. From that time to the day of his death he was, in one capacity or another, on the teaching force of Harvard University. His death diminishes the altogether too small number of men in whom specialized scholarship has not made impossible broad culture and human sympathy.

Football Reform
One stage in the progress toward more wholesome conditions in intercollegiate football was reached last week. The new rules formulated by the American Intercollegiate Football Rules Committee were put into final form on Saturday. These rules may be divided into two categories: In the first may be put those rules which have been framed to bring about a more open game, putting less of

a premium upon mere weight and strength and more of a premium upon speed and alertness. To attain this. devices have been adopted to make the line of scrimmage less compact and to foster longer runs. In the second category may be put those rules which have been framed to penalize and as far as possible to eliminate brutality and other kinds of unfair play. Certain acts have been stigmatized as brutal and unfair. severe penalties have been attached to them, and an additional official has been added to make detection of the violation of rules easier. All these rules, however, are but forms which can be effective only as they represent a sound spirit in athletics. The Committee itself recognizes this fact, and urges officials to enforce not merely the letter but also the spirit of the rules. How successful these new rules will be no one, we believe, can now tell. Much depends upon how far a wholesome and intelligent determination to make college athletics clean has extended. These rules have been made in good faith; they ought to be fairly tested. In the meantime various colleges have taken separate action. At Yale the faculty, running somewhat counter to tradition, has made certain restrictions; at Wisconsin the ban on football has been removed, as it has also been at New York University, which called the conference that resulted in the formation of the new Rules Committee; at Harvard the Athletic Committee has pronounced in favor of football under the new rules, but the matter is still subject to action by the Overseers and the Corporation.

(6)

England Rules One-fifth of the Earth's Surface The Local Government Board's census of the British Empire has now been issued. The task

was undertaken some years ago at the instance of Mr. Joseph Chamberlain when he was Colonial Minister in the Conservative-Unionist Cabinet, but the report is officially addressed to Mr. John Burns, the President of the Local Government Board in the new Liberal Cabinet. The two men represent opposite extremes—one is an imperialist, and the

other a leader who dislikes the term imperial. Since the preceding census millions of square miles have been added to the British Empire. Its aggregate area is now nearly twelve million square miles (Russia's falls short of nine million), thus exceeding one-fifth of the land surface of the globe, and its population is over four hundred million, or about that of China; Russia, the third Empire in point of population, with about a hundred and forty million, stands far below. In India there has been a decrease of population because of famine and plague. Aside from this, there has also been a decline in the rate of increase throughout the remainder of the Empire. Nevertheless, King Edward's subjects in Asia exceed three hundred million; in Africa, forty-three million; in Europe, forty-two million; in America, seven and a half million; in Australasia, five million. Classifying these by religion, we find no less than two hundred and eight million Hindus, ninety-four million Mohammedans, fifty-eight million Christians, twelve million Buddhists, and twenty-three million Parsees, Sikhs, Jains, Jews, Confucians, and adherents of other religions.

(2)

Romance, history, and Prince Rupert adventure happily blend in the naming of a city not yet in being, but which, it is entirely safe to say, will play an important rôle in the future development of Canada's great Northwest. Realizing the importance of a right selection of a name for the city to be established at the western terminus of its great transcontinental railway, the Grand Trunk Pacific Company some time ago offered a prize of \$250 to the person who would suggest a name that should be euphonious, appropriately significant of Canada, and more particularly of the Northwest and British Columbia. Company received upwards of twelve thousand suggestions, and awarded the prize to Miss Macdonald, of Winnipeg, who suggested Prince Rupert, the name eventually selected. The selection happily restores to the geography of North America the name of the dashing cavalry officer who harried Cromwell's sturdy Ironsides, contested with Blake the supremacy of the seas, and, after a romantic career in the Old World, made for himself a name as an explorer in the New. For his brilliant though in the end unsuccessful services in the Stuart cause, Prince Rupert received from Charles II. in 1669 a grant to a vast domain in North America for a century or more known as "Rupert's Land." The grant was made to Prince Rupert, eleven other noblemen, and six commoners, who were officially styled "The Governor and Company of Adventurers of England trading in Hudson Bay." The grant comprised a vast domain, much vaster in fact than King Charles or even Prince Rupert dreamed, embracing as it did all the territory drained by the waters flowing into Hudson Bay. With true kingly generosity, this "Company of Adventurers" was required yearly to pay to the King and his successors only two elks and two black beavers. The Company took formal possession of their new empire, and established tradingposts from the Atlantic to the Pacific, including what is now Alaska. the exception of a period of seventeen years, during which it was held by the French, the Company, known later as the Hudson's Bay Company, claimed occupancy and control of all this vast region, excepting, of course, Russian America, now Alaska, down to 1867, when, under the "British North American Act" of the Imperial Parliament, negotiations were entered into whereby in 1869 "Rupert's Land" became a part of the Dominion of Canada. The importance of the grant to Prince Rupert is readily seen in the fact that it was the charter of the Hudson's Bay Company which he secured that saved the great Northwest to Canada, and it was this grant also that was the historical bar to the old-time slogan, "Fifty-four forty or fight," which once endangered the peace between the United States and Great Britain. The city which is thus fitly to perpetuate a name so closely associated with British North America will be established on Kalen Island, about forty miles below Port Simpson. It is near the Skeena River, and along the banks of the latter will be built the railway to terminate at Prince Rupert.

The President's Speech

The speech of the President, which we print in full this week, is, in our judgment, one of the most important utterances which he has ever made. It is important as the utterance of the President of the United States. It is still more important as the reflection of a sentiment, gradually crystallizing into an opinion, of a great body of Americans of sane mind, progressive temper, and moderate incomes. It embodies three convictions:

I. Indiscriminating condemnation is as bad as indiscriminating approbation. The periodicals which indulge in it are The heart of not critical periodicals. America is sound and the conscience of America is alert, and it is because they are so that the robberies perpetrated in violation of law by some labor leaders and the robberies perpetrated under cover of law by some capitalistic magnates have aroused such a passion of healthy To keep that passion indignation. healthy it must be controlled and directed by a sound judgment. With this The Outlook absolutely and without qualification agrees.

II. The enormous fortunes accumulated by a small number of capitalists are a menace to the country. menace is not averted by generosity in the expenditure of the incomes which are derived from these fortunes. As a remedy the President proposes "a progressive tax on all fortunes beyond a certain amount, either given in life or devised or bequeathed upon death to any individual—a tax so framed as to put it out of the power of the owner of one of these enormous fortunes to hand on more than a certain amount to any one individual; the tax, of course, to be imposed by the National and not the State Government." We agree with the President's diagnosis: such fortunes are a menace to the Republic. We do not consider the remedy which he proposes to be adequate. We doubt whether the Federal Government can under the Constitution levy such a progressive tax on all fortunes. We are quite sure that if it could do so it would only mitigate, not cure, the evil. The remedy must go deeper. Law must at least so far modify the tariff as to prevent it from being a stimulant to the acquisition of great fortunes. It must bring all corporations under such legislative supervision and control that the common people can invest their savings in productive industrial enterprises as safely as they are now invested in savings banks. Above all, it must, by a system of taxation on the land and its contents, secure to the people that common wealth which under our present industrial system is put up to be gambled for by the unscrupulous or laid hold of for their own benefit by the astute and the strong. brief, we cannot maintain an industrial system which promotes the creation of great fortunes in the hands of a few and remedy the evil by distributing among the people a part of the fortune at the possessor's death. We cannot go on eating fats and sweets and preserve our health by an occasional dose of calomel.

III. The Federal Government must "in some form exercise supervision over corporations engaged in inter-State business-and all large corporations are engaged in inter State business—whether by license or otherwise, so as to permit us to deal with the far-reaching evils of overcapitalization." Yes! And other evils than overcapitalization. The Outlook has no doubt that Congress can forbid any corporation to engage in inter-State commerce unless it has first received a license from the Federal Government, and that it can attach any reasonable qualifications to such license. In this way all great corporations can be brought under Federal supervision and control. The end sought appears to The Outlook just, the means proposed legitimate and probably wise.

By suggestions two and three the President has propounded for discussion two very important and far-reaching themes; the importance of them has already been recognized both by the European and the American press; the debate is sure to be widely extended and vigorous. The Outlook, without now pretending to speak a final word upon either of these questions, here expresses more than mere first impressions;

they are convictions gradually formed as a result of past studies, they have been heretofore frequently indicated in these columns, and they are here reiterated though not fully formulated.

A Great Senatorial Debate

The movement for railway rate regulation has conferred on the country one benefit: it has produced a real debate in the Senate of the United States. "Hope springs eternal in the human breast," and this event awakens a pleasing anticipation of the time when a real debate may take place in the House of Representatives. In the Senate, Senator Spooner, of Wisconsin, represented one view of the Constitution, Senator Bailey, of Texas, the other, and both were wholly free from the arts of the demagogue and the meretricious rhetoric of the stump speaker. The debate recalls the days of intellectual seriousness which some of us feared had passed from the Senate never to return.

There are three amendments proposed to the Railway Rate Regulation Bill, each intended to limit the interference of the courts with the operation of the bill: one allows them to consider only whether the Railway Rate Commission has by its decision in any case exceeded its legal and constitutional authority; the second allows the enforcement of the Commission's decree to be suspended by an appeal to the courts only in case the railway pays into court at stated intervals the difference between the money it has collected from the shippers and that prescribed by the Commission, or files a bond to secure the payment of the money; the third provides that the decision of the Commission shall go at once into effect, and that the courts shall not by injunction or other decree delay its enforcement. This last was the amendment under discussion.

The Constitution of the United States provides that "the judicial power of the United States shall be vested in one Supreme Court and in such inferior courts as the Congress may from time

to time ordain and establish." Congress organized a Supreme Court and District and Circuit Courts. The Supreme Court is called into existence by the Constitution; the inferior courts by Congress. Has Congress authority to limit the powers of these inferior courts, or do all the powers which belong to courts of justice, according to Anglo-Saxon usage, necessarily inhere in them under the Constitution? This is the question which the Senate debated last week, and which the country has to consider. For convenience' sake we shall designate the opposing opinions as the conservative and the radical view.

I. The Conservative View. The Constitution definitely vests the judicial power of the United States both in law and equity in certain courts to be established by the Congress. These phrases, "judicial power," "law," "equity," had at the time of the adoption of the Constitution a well-defined historical meaning—a meaning determined by the history and traditions of the Anglo-Saxon people. No authority was given to the Congress to limit the judicial power which the Constitution declared should be vested in the courts; to the Congress was given only the task of calling the courts into existence. As soon as they were created the "judicial power" was vested in them by the Constitution, and that power Congress has no power to take away, limit, or modify. In support of this contention is cited among other authorities the following language of Judge Story, of the Supreme Court, in the case of Martin vs. Hunter's lessee (1 Wheaton 304):

The language of the article [Art. III., Sec. I., of the Constitution] throughout is manifestly designed to be mandatory upon the legislature. . . "The judicial power of the United States shall be vested" (not may be vested) "in one Supreme Court and in such inferior courts as Congress may from time to time ordain and establish." . . . If, then, it is the duty of Congress to vest the judicial power of the United States, it is a duty to vest the whole judicial power: The language, if imperative as to one part, is imperative as to all. . . . But even admitting that the language of the Constitution is not mandatory and that Congress may constitutionally omit to vest the judicial power in courts of the United States, it cannot be denied that when

it is vested it may be exercised to the utmost constitutional extent.

Based upon these principles and this Supreme Court authority, Senator Spooner thus states the conservative position for which he contends:

They [the framers of the Constitution] intended by the Constitution to create, and did create, three co-ordinate and independent branches of the Government, to each of which was assigned its proper function, clothed with the power essential to their proper discharge. They intended that each should be in its sphere absolutely free from invasion by the others. They created the legislative department to enact rules of action, the executive department to administer the laws, the judicial department (the weakest of all in a way) to hold each of the others—the legislative and the executive—strictly to the limitations of the Constitution. Each was to be permanent as the Government itself, until changed by the people.

II. The Radical View. The Constitution does not define judicial power. Giving to Congress the authority to create the courts, it leaves with Congress the authority to define in detail the powers which those courts may exercise. gress has Constitutional authority to abolish the courts which it has created: but authority to destroy all the power of the courts necessarily involves authority to limit their powers. Congress frequently has thus limited the judicial power of the courts, and has been uniformly sustained by the Supreme Court in so doing. Thus by statute Congress has defined both the punishment which the courts may inflict for contempt, and the cases in which punishment may be inflicted: has limited the power to grant mandamuses to certain specified cases; has forbidden the courts to issue executions against the person in enforcement of their judgments, by the provision that "No person shall be imprisoned for debt in any State on process issuing from a court of the United States when by the laws of such State imprisonment for debt has been or shall be abolished." In these and other analogous cases the Supreme Court has affirmed the Constitutionality of the acts of Congress. Basing his argument upon these principles and these and other analogous authorities cited from the decisions of the Supreme Court, Senator Bailey answers the question whether Congress can limit the powers of the Federal courts in the following language:

That they have inherent powers in one sense is true; that is, if you create a Federal court, and do not expressly forbid it to exercise certain powers, it possesses them by virtue of its creation. Such is the power to issue an execution to enforce its judgment; such is the power to punish summarily for contempt; and yet the books are full of cases which affirm the power of Congress to prohibit this right of the court to issue execution or to punish for contempt, except according to the statute. When the Supreme Court expressly has decided that Congress can regulate the power of a Circuit Court to issue an execution, in God's name how can a lawyer contend that Congress can regulate the right of that court to issue a mere interlocutory decree?

III. Our View. The question which we have thus endeavored to define is one of far-reaching importance. If Senator Bailey is right, Congress could abolish all equity jurisprudence, the whole system of injunctions and mandamuses, could substitute for a punitive administration of justice a purely reformative system, could so curb and limit the power of the courts as to deprive the individual of a very important if not an absolutely essential safeguarding of his person and property. If Senator Spooner is right, the courts possess a power greater than Congress itself, and can neither be deprived of 'heir present powers nor invested with new powers if those which they now possess are inadequate. For if the Constitution defines by the phrases "judicial power," "law," and "equity" the powers of the courts so that Congress cannot diminish them, neither can Congress increase them. Thus the question is perhaps the most vital which has been brought before the country since it was called on to consider whether the Congress had Constitutional authority to prohibit slavery in the Territories. No opinion on this question is or can be authoritative except that of the Supreme Court of the United States. But the question is not complicated; it is one for laymen no less than for lawyers. Laymen as well as lawyers will differ in their solution of the problem. Outlook accepts the more radical view, or that of Senator Bailey, in spite of the

conceivable dangers enumerated above, chiefly for these three reasons:

1. A partial examination of the acts of Congress and the decisions of the Supreme Court convinces us that this view has been consistently held and acted upon from the foundation of the Government.

2. An examination of the language of the Constitution confirms this historic interpretation. The Constitution uses the phrases "legislative power," "executive power," "judicial power;" but it does not define either phrase. It appears to us that the term "judicial power" is used in the Constitution to distinguish it from "executive" and "legislative power," and signifies simply "the power to construe and expound the law, as distinguished from the legislative and executive functions" (Bouvier's Law Dictionary). The Congress cannot exercise that power nor vest it in the President, as it cannot exercise executive power, nor vest in the courts or the President legislative power. But while the general power to construe and expound the law is vested in the courts by the Constitution, the powers which they are to possess in order to construe and expound the law rest wholly with the people, and may from time to time be increased or diminished; and this must be done by the representatives sitting in the Congress. The Congress cannot take the judicial power from the courts, but it can determine what shall be their judicial powers.

3. The radical position is not only confirmed by the practice of the Nation and the decisions of the Supreme Court, and sustained by the language of the Constitution; it also appears to us to be in accord with sound political principles. It is not for the advantage of the Nation that the courts should be guaranteed all the powers possessed by Anglo-Saxon courts prior to 1787, nor deprived of the possibility of possessing additional pow-The Nation should not be tied hand and foot even by its own traditions, still less by those of the mother country. The people should be able to confer additional powers on the courts if such are necessary for their efficiency, and to take from the courts powers already possessed by them if they are used injuriously. History shows that from the time of Moses down the people have suffered more from unjust or unwise judges than from their own excesses. It is safer to trust the people with absolute power than to vest that power in any oligarchy—executive, legislative, or judicial. The way to prevent the destruction of the courts by Congressional action is not by making them independent of Congress, but by electing good Congressmen. is peril from the passions of an unchecked democracy; but the remedy is not the creation of a judiciary with power which can neither be increased nor diminished, but by the maintenance of a judiciary whose judicial powers are always subject to ultimate popular decree.

Whether it is wise to deprive the Federal courts of their power to grant injunctions or otherwise to stay proceedings under the decisions of the Inter-State Commerce Commission we do not here discuss. We are doubtful of the wisdom of such a measure. But we believe that Congress has authority to increase and diminish, in its discretion, the powers of the Federal courts, except those of the Supreme Court.

Maxim Gorky

Alexei Maximovitch Pyeshkoff, widely known under his writing name of "Maxim Gorky," who arrived in this country last week as a representative of the revolutionary movement in Russia, is a very interesting and from certain points of view a significant figure in contemporary Russian life. Political and economic conditions in Russia for many decades have pressed so closely upon the instincts, occupations, habits, and ideals of the people that they may be regarded as constituting in an unusual sense the vital conditions of Russian life; and for this reason Russian literature has shown very little of the ease, the play of humor, the sense of freedom, which bears fruit in the delicate touching of many kinds of art for the mere pleasure of it. intimately than any other modern literature it represents actual conditions; and as the expression of these conditions perhaps the best explanation of the Russia of to-day, seething with agitation and in the throes of revolution, is to be

found in the novels of Gogol, Dostoyevski, Turgénieff, and Tolstoy. This fiction is the outcry of the soul of Russia, repressed and stunted, but in passionate protest against the oppression which has arrested the normal development of the Russian people, checked its freedom of thought, and in a way blighted the beauty of its imagination. One of the saddest chapters in the history of the last twenty-five years in that country has been the disappearance of a group of promising young writers who, a generation ago, by the variety of their talents, their enthusiasm, and their devotion to the higher ideals of the Russian nature, seemed about to inaugurate a new movement in Russian literature. To-day many of them are dead, others are in exile, and a feeble remnant of white-haired and broken men constitute a terrible arraignment of the kind of government which, instead of freeing the genius of a people, destroys it. When Turgénieff wrote "Fathers and Sons," he awoke the conscience of the Russian people and opened its eves to the conditions of the serfs. In "On the Eve" and in various other novels he pictured the Russian idealist eloquently declaiming against the Government, but entirely lacking the willpower to right abuses or to lead a movement of liberation. Tolstoy has been driven by Russian conditions into a philosophy of religion and life profoundly interesting as the expression of a man of perfect sincerity and of great genius, but entirely unworkable as a social system. Gogol's "Dead Souls" and "The Inspector" lifted the veil from the widespread demoralization of Russian character. Dostoyevski's "Crime and Punishment" was a tragic study of some contemporary social conditions in that country. These writers, despite the sense of melancholy and the note of despair which pervades their work, disclose a certain breadth of view, and represent the great traditions of literature.

Maxim Gorky is a man of a different type of mind, the exponent of a much narrower view, the representative of a class rather than of the nation. Of humble parentage, neglected and practically abandoned in his childhood, he became a tramp, and while he was still a boy the bitterest and the most sordid side of human experience was driven into his consciousness. He scorned books; but when Dumas, Gogol, and other writers came in his way, his imagination took fire and his intellectual life began. He knew the great floating population of Russia at first hand; the men who live on the great rivers, the tramps, the outcasts, the prostituteseven the thieves: and he became their For the first time, almost, in recorder. the history of literature, the lowest types of men and women entered into art, and their characteristics were seized upon by a man of intimate knowledge and of a narrow but powerful and graphic imagination. His genius is at its best in his short stories, many of which have an astonishing vitality, vividness, and power; such a story, for instance, as "Toye" (The Trio), which describes the career of three boys whose childhood was passed in the most sordid and wretched surroundings, who had companionship with thieves, murderers, and prostitutes, and were overweighted with temperament; one passionately proud, another of a sensitive, poetic nature, and the third an embryo philosopher. The individuality of this little group is sketched with intense and almost passionate sincerity and in the realistic manner. Another little story, "Twentysix of Us and One Other," describes a group of bakers in a subterranean bakery, whose habits were hardly above those of animals, doing their work under the most noisome conditions, to whom the poetry of life is represented by an innocent Russian girl who passes in and out of the building in which they are at work, with a smile or a word of greeting for them, and becomes a kind of divinity to them. Then comes the villain in the character of a young soldier, and the men watch in an agony of apprehension, comforting one another and laying wagers on the virtue of the girl; and when finally her history mingles with the sad history of so many girls of her class, the light of day fades out for the little group of men, to whom her personality was a crevice through which the blue of heaven shone. In his longer story, "Foma Gordyeeff," Gorky drew a picture of life among the

commercial classes which holds both the characters and the readers with the relentless grip of the hardest kind of realism, brutally frank and direct.

Genius of a kind Gorky undoubtedly possesses; intimate knowledge of phases of life to which, as a rule, literature has been a stranger, is at his command. But he lacks breadth of view, a sense of the wholeness of society. He is partial, one-sided, and narrow. He lacks the religious enthusiasm of Tolstoy, the breadth of social outlook of Turgénieff; and there is behind his terrible picture of the worst social conditions none of that grasp of general laws which infuses such volumes as "Nana" and "L'Assommoir" with a terrible fascination. The sympathies of the American people have been profoundly stirred by the needs and distress of the Russian people. They are naturally in touch by instinct and by conviction with a great people struggling through mist and darkness towards a freer life. But they will wait, before accepting Gorky's interpretation of affairs or his leadership in the movements of the day, for a definition of his aims and the methods by which he would secure them. It may, however, be said with confidence that, whatever allowance charity may make for individuals, there is no considerable body of people in this country who will follow as a leader or respect as a teacher one whose teaching or whose example indicates a disregard for the sacredness of the family.

The Aftermath

Easter morning was the beginning of the world-wide disclosure of the religion of Christ to men. To us, too often, it marks the culmination of the Christian year, the end of the typical experience of the founder of our faith. The tide of devotion, steadily rising through the Lenten season, touches high-water mark in the joy of the great festival and then subsides in the regularity of the ordered services which fill the year until Advent recalls once more the figure of the Master of life. To the first believers the day of the Resurrection meant something deeper and more significant than it means to

too many of their successors to-day. It was a day of fulfillment, but it was even more a day of beginnings; it marked not the culmination but the widening of a great force in the affairs of men; not the sublime apotheosis of the greatest of Teachers, but the going forth of his spirit to the ends of the earth; not the finishing of a unique work, but the beginning of the work of that church which, despite its wanderings and divisions, is still the body of Christ.

Easter morning will always bring in the divinest of days; no other festival has so much joy in its keeping as that which commemorates the victory over death and the sudden flooding of the sorrowful world with hope and life. But Easter is much more than a refuge from fear, a sanctuary where the tears of sorrow are dried and smitten hearts calmed with faith and filled with joy; it is the starting-point for a new vigor in the running of the race; it is a new consecration to the work, a new rest and strength in the sorrows, uncertainties, and cares of life. The Disciples did not stay in the places which his reappearance had made memorable; they did not make a church of the tomb; they did not rest in the assurance of their immortality: they had come, not to the end, but to the beginning of their faith and work. What they had dimly hoped they now possessed; what the most spiritual of them faintly discerned they now understood; Easter was to them, not the culmination, but the confirmation of the great new faith which had been born in their hearts. Their questions were answered, their doubts set at rest, their night of ignorance and uncertainty turned to day; the revelation of the will of God and his purpose toward his children in the human life of the Christ was completed; their hour of service had struck, their part in the great work had been assigned, their ministry begun. From the empty tomb went forth a band of disciples indifferent to toil, ready for hardship, emancipated from the fear of death, to carry the glad tidings to the ends of the earth. For Easter is not only a great memory, it is a great hope; it is not the end but the beginning of the world-wide coming of that light of immortality which means, not simply release from fear, but the joy and courage and boundless energy of the measureless life of God in the soul of man.

Every Easter ought to bring with it a renewal and deepening of faith expressed in greater strength and a more steadfast devotion to the bringing of righteousness and peace among men. If Christ be risen from the dead, then of all men to reverse the Apostle's phrase-are those who believe most happy; and it is of the very essence of happiness that it diffuse itself. Pleasure is often selfish; happiness must always have in its heart a fervent desire to share with others that which it feels is too great to keep for itself. The modern world is full of unhappiness because it is full of unbelief; the air is charged with doubt, pessimism, and despair. To be happy in such an age as this is the first duty of every man who believes in God and his care for his children; for happiness is the state of those who know that, while all kinds of pain and sorrow may meet them on the way, they are forever safe in his keeping; and that, however black may be the clouds that hang about the world, there is nevertheless a divine purpose being worked out in the troubled life of the race. If everywhere to a few men and women there should come the victorious joy, the burning zeal, which the first Easter brought to the first disciples, the air of the world would be changed as if by magic, a new courage would invigorate all good works, a new peace fall on minds now oppressed with forebodings, a new joy kindle under the somber skies. If Christ be risen, why keep the stone before the sepulcher in which the highest hopes of the race are hidden! Men need the joy and freedom of a great renewal of faith; those who believe need a tonic in the debilitating air of the time; let them take counsel with their noblest aspirations instead of with the semi-despair of those interpreters of life who read its mysteries without the light of the Resurrection; let them rest, not in the guidance of their fellows, blind and baffled like themselves, but in his leadership who knew sorrow and pain and sin as no other has ever known, and who could say in the

presence of all the misery of the world—God is love, and ye are his children.

"The Supreme Need of the Modern Church"

The nineteenth century will be memorable for an industrial revolution which enormously increased the wealth-producing power of the civilized nations. Political economists contemplating its results agree that society is now confronted with the problem of an equitable distribution of the wealth produced by increasing power in increasing volume. The twentieth century already bids fair to effect this somehow, whether by evolution or revolution is not yet clear:

"For all the past of Time reveals A bridal dawn of thunder peals, Whenever Thought hath wedded Fact."

Those who carry distinct recollections of but a decade of illustrative events are aware of a social movement setting in throughout Christendom with a steadily swelling current. Not to speak of the portentous growth of Social Democracy under the shadow of German militarism, the gage of battle against privileged interests flung down by "Labor" in the recent British election is of closer significance to us, among whom the doctrine of municipal ownership, imported or rather re-enforced from our mother country, has lately gained surprising strength.

No more significant sign of the set and the strength of this social movement has appeared among us than the turn recently given at Yale to the Lyman Beecher Lectures on Preaching. For thirty years this lectureship has been filled by men of distinction in American and British churches. This year it was for the first time exclusively devoted to setting forth "The Social Message of the Modern Pulpit." The lecturer, Dr. Charles R. Brown, of California, possessed unusual qualifications for such a service. The First Congregational Church at Oakland, which he has served for ten years, includes in its membership of nearly fourteen hundred many representative business men of large means, and many whose capital is mostly or only in

themselves. He is also a voting member of the Central Trades Council, the executive body of the labor organizations in that city of 70,000 people, a man in whom both capitalists and laborers confide for just appreciation and competency to lead.

At the Des Moines meeting of the National Council of Congregational Churches in 1904, Dr. Brown's address upon "The Supreme Need of the Churches" to apply the social principles of the Gospel to the conditions of everyday life was noted as one of the most significant utterances of that occasion. That address constitutes the core of the eight lectures delivered at New Haven. That so staid and conservative a university as Yale brought Dr. Brown across the continent to give them, primarily, to the young men it is training to preach the Gospel, must be deemed, in view of their substance, a most noteworthy sign of a changing time.

These lectures bring an indictment against the economic system of Christendom as both unjust and inhuman, together with an appeal to the Christian conscience to humanize it according to the ideals of Jesus. The third lecture, grounded on "the story of an ancient labor movement" in the Book of Exodus, drew a close and stinging parallel between the bitter lot of the Hebrew laborers for Pharaoh and that of many of our own people whose labor contributes to splendid fortunes:

Are there not thousands of breaker boys at the mines in Pennsylvania, and of bobbin girls in the cotton-mills of the South, and of factory hands, both men and women, in all the huge manufactories, whose physical health and mental unfolding, whose spirit of hope and moral stamina, are being ruthlessly undermined by the grinding demand for large profits and good dividends, in order still further to swell the most extravagant scale of living, on the part of great numbers of the prosperous members of society, which this world has ever seen?

These are not the words of a demagogue. Neither ignorance nor class interest can be imputed to the speaker. It is not in the market-place, but before the Areopagus, that he declares: "There are Pharaohs in our counting-rooms as well as in those palaces on the Nile." Yet it is not individuals so much as the

system which breeds and binds them that he condemns. If steel-workers are discarded at forty-five, it is for the reason given by their superintendent: "The way we have to rush things now makes it necessary for us to get in a batch of men, work them out, and then get a fresh batch." If twenty thousand children under twelve are slaving in Southern cotton-mills, it is for the same unreason: "We have to compete with other mills, and keep our profits up." And so, to speak blunt truth, seed-corn is fed to hogs. Pertinently Dr. Brown asked, "What type of human being will such a process ultimately produce?" Spiritual values are at stake in the industrial struggle. "Let my people go that they may serve me "—the Voice that spake in Egypt speaks in America.

Dr. Brown's indictment of our economic system is that it is a system of unmodified self-interest, and that this ruling principle brings in, not the kingdom of heaven, but the kingdom of hell. The way out, however difficult, is plain. It is in substituting for the ideals of Pharaoh or Crœsus concerning property the ideals of Christ concerning persons. "There is a will of God about wages and hours, lands, mines, luxury, and penury," as affecting human welfare. Jesus would found the social order on the basis of human brotherhood in the service of one another as the service of the All-Father. Here Dr. Brown is as strong constructively as in the criticism preceding. His main emphasis is on the axiomatic principle of the social responsibility of the strong for the weak, and on the co-operation of trained specialists and Christian preachers as guides and inspirers of the divine task of humanizing inhuman conditions.

These lectures in book form are very likely to elicit a wider interest than any of their predecessors. Two classes of people, poles apart from each other, will regard them with more or less distrust. On one hand high and dry economists will resent what seems to them an unwarrantable intrusion of sentiment into business. George Eliot long ago turned the point of this objection in saying, "The desires of men are the molecular forces of economics."

Her meaning is obvious. What gives value to anything is the fact that some-body desires it. What nobody desires has no economic value. Economics is simply the steward who fills the orders of desire, regardless whether it is the desire of Judas Iscariot or the desire of the Good Samaritan that gives the order. But there can be no question which of these two has the right of way. So far, then, from the demand of Christian ethics upon economics being an intrusion into business, it is rather an extrusion of Satanic ethics out of business.

On the other hand are revivalists, relying solely on efforts for individual regeneration to "reach the masses" weighed down by oppressive conditions. Statistics expose the futility of this rowing with but one oar. During the first half of the nineteenth century, while the conditions of industrial life were substantially democratic, revivals of religion multiplied the churches much faster than the population grew, although their gospel was individualistic. During the second half-century, as industry gradually passed into its present oligarchic organization, this rate of increase declined, though great revivalists traversed the land. During the last decade of the century the growth of the churches just kept pace with that of the population, and since the present century began has dwindled to 77.5 per cent. of it. It is not that the individualistic type of Christianity has been less frequently or fervently preached. It has rather been proved socially unserviceable, unable to expel social injustice from an environment in which multitudes find the higher aspirations of humanity constantly baffled and starved.

Thus experience gives point to the word for the hour that was spoken at Yale:

The Hebrew Church began with an industrial deliverance. The Divine Voice spake to meet the social needs of a people in bondage. Their deliverance was a social readjustment. The Christian Church, likewise, in its beginnings was accompanied by a social reaction which found expression in a voluntary communism. A people full of the Holy Spirit endeavored to conform the industrial and social relations of men to the will of Christ. This is the supreme need of the modern Church.

The Spectator

"It is the needless waste of the modern hotel magnificent rather than its ostentatious luxury that in particular disgusts me," said the Spectator's friend who had been spending a week at one of New York's expensive hostelries. "If one wants marble-pillared entrance, extravagant decoration, bizarre coloring, a medley of effects from white and gold to Circassian walnut, a sickening surfeit of the ornate unrelieved by one small oasis of simplicity to rest the eye, with all the machinery of 'complete comfort' (so called) which goes with the palace idea of an inn, why, he gets what he pays for. But when it comes to a like lavishness of the menu, the practical necessity of ordering more than one wants or can eat without gorging, to get a part of what is wanted, then my old-fashioned conscience revolts; for it is simply waste; and while luxury may be, and is, justified-since justifiable luxury is so wide a variable, according to condition, as to elude definition for others-waste cannot be justified. The cardinal principle of modern business (and these days we all think in terms of business) is to minimize waste, to 'utilize the by-prod-Yet in one great feature characterizing the life of a people devoted to business as we Americans are—our hotel system, of whose superiority so much is made—waste in food is accepted as a matter of course."

The Spectator, who heartily indorsed his friend's protest as embodying certain hazy notions and distinctions of his own. recalled it not long after while listening to the experience of another friend, a generous man of inherited wealth, but a man whose soul abhors waste. Perhaps in him such natural abhorrence has been intensified by the fact that his specialty as a university professor is sociology. "I took my family to New York recently for a week's stay at the Blank," he said. naming a leading hotel; "and, having heard so much of the cost of living there. I thought I would try an experiment. I decided that we should live as nearly as possible as we did at home, and, by keeping exact figures of the cost of each

meal, find at the week's end the average cost for each per day. There were five in our party, my wife, the governess, the two children, who are twelve and fourteen, and myself—practically all adults. This, of course, enabled me to take advantage of a single or double portion of anything, as vegetables, where it would suffice for the party. I did not stint any one, but did not order the most expensive dishes. What did I order? Well, we usually had fruit, a cereal, and eggs and coffee for breakfast; cold meat and salad, perhaps, with fruit, for lunch; soup, a roast, say, and two vegetables, with salad, dessert, coffee, and a bottle of claret for the older ones, for dinner. included the claret and the usual fees, and found that the average cost for each of us was \$2.65 a day, at what is reputed to be one of the most expensive hotels in New York. Had I been a little less careful in ordering just enough, and had I ordered more of the unusual things, taking the license one is apt to take at a hotel, that average cost might easily have been nearer five dollars a day. experiment gives me a line on what the waste of hotel living is, at least for transient patrons."

One such hotel in New York "serves from four thousand to six thousand meals daily." This was the statement of its manager when interviewed recently on the remarkable expansion of the hotel business, due to an abnormal prosperity, as shown by what the reporter calls "the recordbreaking demand for high-priced food supplies." Now, it happens that the Spectator has been shown through the pantries and the kitchen of this particular hotela most reassuring custom, by the way, to prove that the process of wholesale cooking may be so sanitary as actually to give confidence, even zest, to appetite. But what most struck the Spectator was, not the perfect cleanliness everywhere, which he of course expected, but the crematory to consume everything that left any table, on any plate or platter. No matter how little anything had been touched, though even more than half a sirloin steak, for example, had remained on the platter just as it came from the kitchen, it was incinerated with the

unusable débris. What such palatable leavings of food would total in a hotel conducted regardless of waste, and serving from four thousand to six thousand meals daily, the Spectator does not venture to guess. But here certainly, as it seems to him, is a by-product of the hotel business to be utilized for those who need "just food." The Spectator offers this suggestion modestly, appreciating that a seemingly simple plan may often involve difficulties that would make it practically valueless.

®

Extravagance and waste are associated in popular thought with irresponsible wealth, usually speculative or inherited. Few appreciate how largely these characterize the less fortunate, even the poor. The Spectator has, in this connection, more than once recalled the talk he had with the head of the Organized Charities in a New England manufacturing city. The topic was the high cost of living there, especially the price of meat. "But our butchers say," explained the local authority, "that they cannot sell their poorer cuts of meat to any but their richer customers. They are the only ones who know how to make use of such cuts, or care to try to." There was some complaint at the time that the rate of wages paid, though higher than in most manufacturing cities, was insufficient because of the exceptional cost of living. To one operative with whom he talked the Spectator instanced the popular demand for only the best cuts of meat as an extravagance, even waste, when with a little care and painstaking cheaper cuts could be made equally palatable and nutritious. "But," was the reply, "we ought to get wages enough so that our wives need not have to fuss to make poor meat taste good." For this point of view—that having the best is a social right, and that being obliged to substitute something cheaper, even if satisfactory, is a social wrong—there is, the Spectator has found, no argument but to change the point of view by indirect education. This, he believes, is being slowly but surely accomplished through the now general instruction in scientific cooking.

The Man with the Muck-Rake

By Theodore Roosevelt

An address delivered by the President of the United States at the laying of the corner-stone of the Office Building of the House of Representatives, April 14, 1906, and printed by The Outlook from an authorized copy and by special arrangement

VER a century ago Washington laid the corner-stone of the Capitol in what was then little more than a tract of wooded wilderness here beside the Potomac. We now find it necessary to provide by great additional buildings for the business of the Govern-This growth in the need for the housing of the Government is but a proof and example of the way in which the Nation has grown and the sphere of action of the National Government has We now administer the affairs of a Nation in which the extraordinary growth of population has been outstripped by the growth of wealth and the growth in complex interests. The material problems that face us to-day are not such as they were in Washington's time, but the underlying facts of human nature are the same now as they were Under altered external form we war with the same tendencies toward evil that were evident in Washington's time, and are helped by the same tendencies for good. It is about some of these that I wish to say a word to-day.

In Bunyan's "Pilgrim's Progress" you may recall the description of the Man with the Muck-rake, the man who could look no way but downward, with the muck-rake in his hand; who was offered a celestial crown for his muck-rake, but who would neither look up nor regard the crown he was offered, but continued to rake to himself the filth of the floor.

In "Pilgrim's Progress" the Man with the Muck-rake is set forth as the example of him whose vision is fixed on carnal instead of on spiritual things. Yet he also typifies the man who in this life consistently refuses to see aught that is lofty, and fixes his eves with solemn intentness only on that which is vile and debasing. Now, it is very necessary that we should not flinch from seeing what is vile and debasing. There is filth on the floor, and it must be scraped up with the muck-rake; and there are times and places where this service is the most needed of all the services that can be performed. But the man who never does anything else, who never thinks or speaks or writes save of his feats with the muckrake, speedily becomes, not a help to society, not an incitement to good, but one of the most potent forces for evil.

There are, in the body politic, economic and social, many and grave evils, and there is urgent necessity for the sternest war upon them. There should be relentless exposure of and attack upon every evil man, whether politician or business man, every evil practice, whether in politics, in business, or in social life. I hail as a benefactor every writer or speaker, every man who, on the platform, or in book, magazine, or newspaper, with merciless severity makes such attack, provided always that he in his turn remembers that the attack is of use only if it is absolutely truthful. The liar is no whit better than the thief, and if his mendacity takes the form of slander, he may be worse than most thieves. It puts a premium upon knavery untruthfully to attack an honest man, or even with hysterical exaggeration to assail a bad man with untruth. epidemic of indiscriminate assault upon character does not good, but very great The soul of every scoundrel is gladdened whenever an honest man is

Digitized by Google

assailed, or even when a scoundrel is untruthfully assailed.

Now, it is easy to twist out of shape what I have just said, easy to affect to misunderstand it, and, if it is slurred over in repetition, not difficult really to misunderstand it. Some persons are sincerely incapable of understanding that to denounce mud-slinging does not mean the indorsement of whitewashing; and both the interested individuals who need whitewashing, and those others who practice mud-slinging, like to encourage such confusion of ideas. One of the chief counts against those who make indiscriminate assault upon men in business or men in public life is that they invite a reaction which is sure to tell powerfully in favor of the unscrupulous scoundrel who really ought to be attacked, who ought to be exposed, who ought, if possible, to be put in the penitentiary. If Aristides is praised overmuch as just, people get tired of hearing it; and overcensure of the unjust finally and from similar reasons results in their

Any excess is almost sure to invite a reaction; and, unfortunately, the reaction, instead of taking the form of punishment of those guilty of the excess, is very apt to take the form either of punishment of the unoffending or of giving immunity, and even strength, to offenders. The effort to make financial or political profit out of the destruction of character can only result in public calamity. Gross and reckless assaults on character, whether on the stump or in newspaper, magazine, or book, create a morbid and vicious public sentiment, and at the same time act as a profound deterrent to able men of normal sensitiveness and tend to prevent them from entering the public service at any price. As an instance in point, I may mention that one serious difficulty encountered in getting the right type of men to dig the Panama Canal is the certainty that they will be exposed, both without, and, I am sorry to say, sometimes within, Congress, to utterly reckless assaults on their character and capacity.

At the risk of repetition let me say again that my plea is, not for immunity to but for the most unsparing exposure

of the politician who betrays his trust, of the big business man who makes or spends his fortune in illegitimate or corrupt ways. There should be a resolute effort to hunt every such man out of the position he has disgraced. Expose the crime, and hunt down the criminal; but remember that even in the case of crime, if it is attacked in sensational, lurid, and untruthful fashion, the attack may do more damage to the public mind than the crime itself. It is because I feel that there should be no rest in the endless war against the forces of evil that I ask that the war be conducted with sanity as well as with resolution. The men with the muck-rakes are often indispensable to the well-being of society; but only if they know when to stop raking the muck, and to look upward to the celestial crown above them, to the crown of worthy endeavor. There are beautiful things above and round about them; and if they gradually grow to feel that the whole world is nothing but muck, their power of usefulness is gone. If the whole picture is painted black, there remains no hue whereby to single out the rascals for distinction from their fellows. Such painting finally induces a kind of moral color-blindness; and people affected by it come to the conclusion that no man is really black, and no man really white, but they are all gray. In other words, they neither believe in the truth of the attack, nor in the honesty of the man who is attacked; they grow as suspicious of the accusation as of the offense; it becomes wellnigh hopeless to stir them either to wrath against wrong-doing or to enthusiasm for what is right; and such a mental attitude in the public gives hope to every knave, and is the despair of honest

To assail the great and admitted evils of our political and industrial life with such crude and sweeping generalizations as to include decent men in the general condemnation means the searing of the public conscience. There results a general attitude either of cynical belief in and indifference to public corruption or else of a distrustful inability to discriminate between the good and the bad. Either attitude is fraught with untold

damage to the country as a whole. fool who has not sense to discriminate between what is good and what is bad is well-nigh as dangerous as the man who does discriminate and yet chooses the bad. There is nothing more distressing to every good patriot, to every good American, than the hard, scoffing spirit which treats the allegation of dishonesty in a public man as a cause for laughter. Such laughter is worse than the crackling of thorns under a pot, for it denotes not merely the vacant mind, but the heart in which high emotions have been choked before they could grow to fruition.

There is any amount of good in the world, and there never was a time when loftier and more disinterested work for the betterment of mankind was being done than now. The forces that tend for evil are great and terrible, but the forces of truth and love and courage and honesty and generosity and sympathy are also stronger than ever before. It is a foolish and timid, no less than a wicked thing, to blink the fact that the forces of evil are strong, but it is even worse to fail to take into account the strength of the forces that tell for good. Hysterical sensationalism is the very poorest weapon wherewith to fight for lasting righteousness. The men who, with stern sobriety and truth, assail the many evils of our time, whether in the public press, or in magazines, or in books, are the leaders and allies of all engaged in the work for social and political betterment. But if they give good reason for distrust of what they say, if they chill the ardor of those who demand truth as a primary virtue, they thereby betray the good cause, and play into the hands of the very men against whom they are nominally at war.

In his "Ecclesiastical Polity" that fine old Elizabethan divine, Bishop Hooker, wrote:

He that goeth about to persuade a multitude that they are not so well governed as they ought to be shall never want attentive and favorable hearers, because they know the manifold defects whereunto every kind of regimen is subject; but the secret lets and difficulties, which in public proceedings are innumerable and inevitable, they have not ordinarily the judgment to consider.

This truth should be kept constantly in mind by every free people desiring to preserve the sanity and poise indispensable to the permanent success of selfgovernment. Yet, on the other hand, it is vital not to permit this spirit of sanity and self-command to degenerate into mere mental stagnation. Bad though a state of hysterical excitement is, and evil though the results are which come from the violent oscillations such excitement invariably produces, yet a sodden acquiescence in evil is even worse. At this moment we are passing through a period of great unrest-social, political, and industrial unrest. It is of the utmost importance for our future that this should prove to be not the unrest of mere rebelliousness against life, of mere dissatisfaction with the inevitable inequality of conditions, but the unrest of a resolute and eager ambition to secure the betterment of the individual and the Nation. So far as this movement of agitation throughout the country takes the form of a fierce discontent with evil, of a determination to punish the authors of evil, whether in industry or politics, the feeling is to be heartily welcomed as a sign of healthy life.

If, on the other hand, it turns into a mere crusade of appetite against appetite, of a contest between the brutal greed of the "have-nots" and the brutal greed of the "haves," then it has no significance for good, but only for evil. If it seeks to establish a line of cleavage, not along the line which divides good men from bad, but along that other line, running at right angles thereto, which divides those who are well off from those who are less well off, then it will be fraught with immeasurable harm to the body politic.

We can no more and no less afford to condone evil in the man of capital than evil in the man of no capital. The wealthy man who exults because there is a failure of justice in the effort to bring some trust magnate to an account for his misdeeds is as bad as, and no worse than, the so-called labor leader who clamorously strives to excite a foul class feeling on behalf of some other labor leader who is implicated in murder. One attitude is as bad as the other, and no worse; in

each case the accused is entitled to exact justice; and in neither case is there need of action by others which can be construed into an expression of sympathy for crime.

It is a prime necessity that if the present unrest is to result in permanent good the emotion shall be translated into action, and that the action shall be marked by honesty, sanity, and self-restraint. There is mighty little good in a mere spasm of reform. The reform that counts is that which comes through steady, continuous growth; violent emotionalism leads to exhaustion.

It is important to this people to grapple with the problems connected with the amassing of enormous fortunes, and the use of those fortunes, both corporate and individual, in business. We should discriminate in the sharpest way between fortunes well won and fortunes ill won; between those gained as an incident to performing great services to the community as a whole, and those gained in evil fashion by keeping just within the limits of mere law-honesty. Of course no amount of charity in spending such fortunes in any way compensates for misconduct in making them. As a matter of personal conviction, and without pretending to discuss the details or formulate the system, I feel that we shall ultimately have to consider the adoption of some such scheme as that of a progressive tax on all fortunes, beyond a certain amount, either given in life or devised or bequeathed upon death to any individual—a tax so framed as to put it out of the power of the owner of one of these enormous fortunes to hand on more than a certain amount to any one individual; the tax, of course, to be imposed by the National and not the State Government. Such taxation should, of course, be aimed merely at the inheritance or transmission in their entirety of those fortunes swollen beyond all healthy

Again, the National Government must in some form exercise supervision over corporations engaged in inter-State business—and all large corporations are engaged in inter-State business—whether by license or otherwise, so as to permit us to deal with the far-reaching evils of

over-capitalization. This year we are making a beginning in the direction of serious effort to settle some of these economic problems by the railway rate legislation. Such legislation, if so framed. as I am sure it will be, as to secure definite and tangible results, will amount to something of itself; and it will amount to a great deal more in so far as it is taken as a first step in the direction of a policy of superintendence and control over corporate wealth engaged in inter-State commerce, this superintendence and control not to be exercised in a spirit of malevolence toward the men who have created the wealth, but with the firm purpose both to do justice to them and to see that they in their turn do justice to the public at large.

The first requisite in the public servants who are to deal in this shape with corporations, whether as legislators or as executives, is honesty. This honesty can be no respecter of persons. There can be no such thing as unilateral honesty. The danger is not really from corrupt corporations; it springs from the corruption itself, whether exercised

for or against corporations.

The eighth commandment reads, "Thou shalt not steal." It does not read, "Thou shalt not steal from the rich man." It does not read, "Thou shalt not steal from the poor man." It reads simply and plainly, "Thou shalt not steal." No good whatever will come from that warped and mock morality which denounces the misdeeds of men of wealth and forgets the misdeeds practiced at their expense; which denounces bribery, but blinds itself to blackmail; which foams with rage if a corporation secures favors by improper methods, and merely leers with hideous mirth if the corporation is itself wronged. only public servant who can be trusted honestly to protect the rights of the public against the misdeed of a corporation is that public man who will just as surely protect the corporation itself from wrongful aggression. If a public man is willing to yield to popular clamor and do wrong to the men of wealth or to rich corporations, it may be set down as certain that if the opportunity comes he will secretly and furtively do wrong to the public in the interest of a corpora-

But, in addition to honesty, we need sanity. No honesty will make a public man useful if that man is timid or foolish, if he is a hot-headed zealot or an impracticable visionary. As we strive for reform we find that it is not at all merely the case of a long uphill pull. On the contrary, there is almost as much of breeching work as of collar work; to depend only on traces means that there will soon be a runaway and an upset. The men of wealth who to-day are trying to prevent the regulation and control of their business in the interest of the public by the proper Government authorities will not succeed, in my judgment, in checking the progress of the movement. But if they did succeed they would find that they had sown the wind and would surely reap the whirlwind, for they would ultimately provoke the violent excesses which accompany a reform coming by convulsion instead of by steady and natural growth.

On the other hand, the wild preachers of unrest and discontent, the wild agitators against the entire existing order, the men who act crookedly, whether because of sinister design or from mere puzzle-headedness, the men who preach destruction without proposing any substitute for what they intend to destroy, or who propose a substitute which would be far

worse than the existing evils—all these men are the most dangerous opponents of real reform. If they get their way, they will lead the people into a deeper pit than any into which they could fall under the present system. If they fail to get their way, they will still do incalculable harm by provoking the kind of reaction which, in its revolt against the senseless evil of their teaching, would enthrone more securely than ever the very evils which their misguided followers believe they are attacking.

More important than aught else is the development of the broadest sympathy of man for man. The welfare of the wageworker, the welfare of the tiller of the soil, upon these depend the welfare of the entire country; their good is not to be sought in pulling down others; but their good must be the prime object of all our statesmanship.

Materially we must strive to secure a broader economic opportunity for all men, so that each shall have a better chance to show the stuff of which he is made. Spiritually and ethically we must strive to bring about clean living and right thinking. We appreciate that the things of the body are important; but we appreciate also that the things of the soul are immeasurably more important. The foundation stone of National life is, and ever must be, the high individual character of the average citizen.

SIDNEY LANIER

BY JOHN WILBER JENKINS

He loved his art and freely spent himself, Counting no cost, nor measuring his days; Not turned aside by misinterpreters Nor halted for the sweet incense of praise.

But, even amid the darkness, his fair face.

Ever turned eager toward the eternal light,

He saw the bright beams of the coming day

Far through the blackness of th' enshrouding night.

Wounded and fallen, still he struggled on, Brave-hearted, valiant to his latest breath: With cypress mourners came; but, laurel-crowned, They found him smiling in the arms of Death.

A TON OF ANTHRACITE

BY FRANK JULIAN WARNE

N the progress of corporate control over the production and distribution of anthracite coal it has come about that the consumer of domestic sizes residing within a radius of one hundred and fifty or two hundred miles of the hard-coal fields of northeastern Pennsylvania pays \$6.75 a ton for the prepared These consumers are principally householders, and as the annual amount used by the average family is estimated to be between fifteen and twenty tons, the yearly charge to each is about \$125, a considerable item in the total cost of living to most families. This fuel is used both for cooking and heating purposes, and naturally a larger amount for the latter purpose is consumed during unusually severe winters. The consumption for heating purposes is confined to about six months of the year-from October to April-while its use in cooking is fairly uniform throughout the twelve months.

Pennsylvania, New York, and New Jersey consume the greater proportion of the total shipments from the region of production, these three States receiving about sixty-five per cent. of the total, while approximately fifteen per cent. goes to New England points and some twelve per cent. to Middle Western States. New York City and near-by points consume annually more than nine million long tons, Philadelphia about four million, and Boston two million long tons. total annual production is more than sixty-five million long tons, the shipments from the region exceeding fiftyeight million tons. This is divided between domestic and steam sizes, so called because the former is used largely in the home and the latter in industries for steam purposes. The shipments of domestic sizes exceed thirty-six million tons, and of steam sizes twenty-two million tons, the relative proportion of each to the total shipments being sixtytwo and thirty-eight per cent. respectively.

In this brief discussion of the elements of cost entering into the price of anthracite with the view of indicating the shares in the consumer's \$6.75 which go to the various agents engaged in the mining, transporting, and selling of hard coal, it is possible to touch upon only the more important factors. This is the price paid per ton for only the domestic sizes. In addition to these, which include grate, egg, stove, and chestnut, and which are largely confined to use in stoves, furnaces, and ranges, the anthracite industry produces five other sizes, with different prices and having different These latter include lump coal, which is marketed in sizes as it comes out of the mine, and pea, buckwheat, rice, and barley, the latter being generally designated as steam sizes, and principally used in the industries for steam purposes.

Under normal conditions the householder, in New York City for example, pays \$6.75 for a ton of the domestic sizes delivered in the cellar. the short ton of 2,000 pounds. A long ton of 2,240 pounds costs the retail dealer five dollars, the difference in weight between the ton he buys and the ton he sells usually being counted by the retail dealer as compensation to him for the quantity lost in the receipt and delivery of the coal. This \$5 is the price per long ton to the retail dealer at the railroad company's delivery point at tidewater, to which amount should be added fifteen cents per ton for boat freight and fifteen cents for discharging, making a ton of domestic sizes delivered in the retail dealer's yard cost \$5.30. rule, it costs the retail dealer twenty-five cents a ton for the labor employed to place a ton of coal in the consumer's cellar, and out of the \$1.20 gross profit per ton remaining he has to meet the cost of conducting his business, such as rent, salaries, wages, interest on capital invested, expenses for horses and wagons, office expenses, bad debts, and the score

Digitized by Google

and one items entering into the conduct of the retail dealer's business. As a general statement, the retail dealer makes from twenty-five to fifty cents a ton on the coal he sells.

If society did away with the retail dealer, and secured coal direct from the railroad carrying and coal-mining corporation, it could save to the consumer from twenty-five to fifty cents on every ton of the domestic sizes consumed, provided the corporation was made to be content with its present earnings, and was not permitted to take to itself also the retail dealer's present net profit. The industry at one time in the distribution of the product supported middlemen—that is, a class of commission dealers performing a service in distribution between the producing companies and the retail dealer—but several years ago this class of distributers was abolished by the coal-producing companies, who now sell their product direct to the retail dealer, thus saving to themselves the middleman's profit or commission.

Out of the five dollars which the retail dealer pays for a ton of the domestic sizes, \$1.60 goes to the railroad company in freight rates for transporting the commodity from the mines in northeastern Pennsylvania to New York, a distance of about one hundred and fifty miles. The writer is aware of the difficulties encountered by one who would endeavor to determine the exact or even approximate cost of transporting a particular commodity over a railroad system. Ordinarily, and in the case of most commodities which are transported along with miscellaneous freight, it is practically impossible to determine accurately the cost of transporting any one article of commerce. But with anthracite coal the difficulties are not so great as with most commodities, for it is transported in entire trains by itself, and, in consequence, every item in the cost of transportation does not have to be separated and allotted among a hundred and more articles. It is true that if the carrying company desires to make the cost of transporting this commodity appear small or large, it would not be difficult for its officials to increase or decrease the cost elements by such percentages as would appear perhaps plausible, but which, nevertheless, would not be fair or just to the consumer of coal.

But this question of freight rates for the transportation of anthracite coal has already been passed upon by the Inter-State Commerce Commission, a tribunal which may be justly regarded as aiming to secure the common good. When the contest between the anthracite-carrying railroads and the "independent" operators was at its height, a decade and more ago, the exactions of the transportation companies were a cause of bitter complaint, and to secure redress against the many forms of injustice then practiced by the railroads, one of these "independent" companies, Coxe Brothers & Co., made formal complaint against the high freight rates. In consequence, the Inter-State Commerce Commission made an exhaustive inquiry into the transportation charges on anthracite coal by the Lehigh Valley Railroad. Without going into the details of this very interesting case, it is sufficient for our present purpose to know that this Federal body handed down a decision in which the rate the railway company was to charge for carrying a ton of anthracite coal to the Eastern markets was fixed at the maximum sum of \$1.40. This rate, the Commission said, gave to the transportation company a profit of sixty per cent, above the amount required to pay operating expenses for coal carriage, which latter the Commission found to be eighty-five cents a ton. This \$1.40 a ton was the maximum charge the company was to levy, the Commission intimating that even this sum might be too high, and if after trial this was found to be the case, the Commission would not hesitate to require further reductions. This decision was handed down before the Supreme Court ruled that the Commission could condemn an existing rate, but had not the authority to name a new rate. present rate, as already stated, is \$1.60. It is plain that if the Commission's rate was made effective so as to benefit the consumer of anthracite, the price of domestic sizes could be reduced at least twenty cents a ton.

After the retail dealer and the railroad

company have been satisfied for the services each performs in distributing the ton to the householder, the consumer's \$6.75 has been reduced to \$3.40. This last-mentioned sum is the price of a ton of domestic size at the mine. It is not possible here to trace out in detail all the elements entering into the coal company's price at the mine of \$3.40, nor is it possible to discuss the more important elements to the extent their importance deserves. I shall have to content myself with a mere enumeration of some of these elements.

The cost of mining a ton of all sizes, steam as well as domestic, ranges all the way from \$1 to as high as \$2.25. matter of fact, the cost of mining is not the same at any two collieries, as the elements entering into determining this cost varies in different mines. In some, for example, the cost of timbering the working places and gangways may be quite an item, and in other mines no part or very little of the expense of min-The same is true of keeping water out of the mines, in some it being drained off naturally at little expense, while in others it has to be pumped out at heavy Owing to impurities in the seam in some mines, the cost of preparing coal for the market may be quite an item of expense, while in other seams the coal is so good and free from impurities as to make the cost of separating them of small consequence.

The most important element entering into the cost of mining is the wages of the employees, which average about \$1.50 on every ton mined. This does not mean that the miner receives \$1.50 for each ton of coal he sends out of the mine, but that the total wages paid to all of the twenty-five and more classes of workers in and about the colliery, distributed proportionately among the tons produced, resolves itself into a charge of \$1.50 for the labor cost on each ton. In addition to this labor cost of mining, the cost of materials has a claim of about forty cents upon the coal company's \$3.40.

Then, again, the coal company, as a rule, but not always, may have to meet the claim of the owner of the land in the form of royalty on every ton mined.

This element in the cost of mining differs on the different sizes, ranging all the way from eighteen cents a ton on coal reclaimed from the culm banks to thirtyfour cents on freshly mined coal. royalty charge is also lowest on the steam sizes. This charge is usually based upon the selling price of coal, readjustments being made, in cases, at intervals of five years. Where the coal-mining company owns the land outright, the payment of royalty to itself is merely a system of bookkeeping which has the effect of making the book cost of coal-mining appear higher than the actual cost. addition to the charges for labor, materials, and royalty, the coal company has to meet interest charges on the capital invested, wages of superintendents, land depreciation charges, and other channels of expenditure incident to the conduct of such great business enterprises.

We have traced all the more important elements entering into the \$6.75 which the consumer pays for a ton of the domestic sizes of anthracite coal. The retail dealer receives \$1.75, the railroad company \$1.60, and the coal-mining company \$3.40, the latter redistributing approximately \$1.50 to the mine workers and an average of thirty cents to the landowner.

Objection may be made to this treatment of the cost elements entering into a ton of anthracite because no account has been taken of the price reduction which usually goes into effect in April of each year, under which the domestic sizes are sold during that month for \$6.25 a ton, with an increase of ten cents a ton each month until the regular price of \$6.75 is restored in September. This is an average reduction for the five months of thirty cents a ton. reduction in price to the consumer about covers the cost to the railroad company for storing the coal during the summer months if it is not taken by the lower price inducement. The seasonable conditions affecting the consumption of hard coal make it to the advantage of the operator to shift the channel of expenditure for storage during the summer months to the consumer's cellar, and the spring reduction in price may be regarded simply as a transaction by which

the operator pays the consumer an average of thirty cents a ton for making use of the consumer's cellar during the summer instead of paying storage charges elsewhere.

It is not the purpose of the writer to claim that any one or all of these charges of the different agents engaged in the production and distribution of anthracite coal is or are excessive. But when it is remembered that, in addition to being what is called a natural monopoly, the system of corporate organization by which anthracite production and distribution are controlled enables the managers of capital in charge of this industry to exact the highest possible monopoly price, it is easily to be seen that, under circumstances which would compel these managers to be content with a less return and a more just compensation upon capital actually invested, the price of anthracite to the consumer would not be so high as \$6.75.

The question as to the future increase in the price of anthracite is one of the greatest importance to the consumer. Competition between producers, which until recent years has been depended upon to prevent unduly and unfair high prices, has lost its force through the system of corporate organization which to-day has secured an absolute monopoly upon not only the present output but upon the entire future supply of this Nor can the competition of bituminous coal be relied upon to safeguard the consumer of anthracite from extortionate monopoly prices. This competition, while effective in keeping down the price of the small sizes of anthracite consumed in the different industries, is of little practical value to the consumer mental investigation an understanding as to the actual capital invested, and refusing longer to pay charges on idle capital of domestic sizes. The latter is confronted by a monopoly which, judging from experience, will exact a monopoly Under the modern capitalistic régime, which does not aim to secure to labor a fair wage, to capital a fair return, and to the consumer a fair price, but which, on the contrary, is directed solely towards obtaining the maximum return possible to capital regardless of the interest of the other parties to production, distribution, and consumption, no consideration of the interest of the consumer can be expected. The experience of the anthracite mine workers the past six years indicates clearly that those in control of capital will accord to labor only so much wages as organized labor can compel it to give. It is also clear that when the power of organized labor is exerted in behalf of the employees aiding in production, then capital yields a fairer return to labor.

The same is true of the consumer, whose necessities give to the anthracite product the larger part of its value. long as the consumers are defenseless through the absence of means or organization to make effective their just claims, iust so long will capital take to itself in high prices for fuel what should properly and justly go to the consumer. It is safe to say that if the consumers of anthracite were sufficiently organized to make effective a demand for their rights, through a refusal, for example, to use the commodity unless the price was reduced. it would not be long before the managers of capital would content themselves with a less and a more just return, through a reduction in the price of anthracite. Or if the consumer exercised the power he possesses by securing through a Governin coal lands held for future use, it is also safe to conclude that the price of anthracite would be reduced.

INTERVIEW WITH A BILLIONAIRE

BY A MEMBER OF THE SETTLEMENT FOR THE NEGLECTED RICH'

SOME of our East Side settlements, established among the neglected poor, are studying the causes of poverty and how to abate it. At Half-Way House, the Settlement for the Neglected Rich, we are studying, on the contrary, the sources of wealth and how to promote it. We are trying to find out where some people get their wealth, how it is invested, and what they are doing with it.

Fifty years ago a man in the city of New York worth \$200,000 was considered rich. Then came the army of millionaires. After they had stormed the city and captured its standards of value a man whose wealth could be quoted in less than seven figures was considered poor. And now the only rich man in New York is the billionaire.

Do you know what a billion dollars means? It means, if invested at five per cent., an income of \$136,986.30 a day for every day in the year!

One of our most active workers at the Half-Way Settlement is a billionaire. He is interested in our aims and ideals. That is why he is willing to grant me an interview. As he shuns publicity, I withhold his name.

"Is it true," I said, "as currently reported, that you have made the greater part of your wealth out of your holdings of Equitable and Mutual Life stock?"

"That is exactly true," he answered, "and I have never been more glad to acknowledge it than at the present time. Only, for Heaven's sake, do not begin these words with capital letters. If these words 'equitable' and 'mutual' and 'life' are to be restored to their true and beautiful significance, they must be decapitalized, which would be equivalent in some cases to decapitalizing the stockholders. I have, indeed, made my wealth out of the process of shareholding, and very largely out of my relations

1 See "A Settlement for the Neglected Rich" in The Outlook for March 3 last.—THE EDITORS.

with other equitable and mutual shareholders, but you cannot understand this unless you understand my method of bookkeeping."

"What is the peculiarity of your book-

keeping?" I asked.

"It is a system of my own; it is algebraic rather than arithmetical in its method. It deals with equations and proportions rather than with fixed quantities. The ordinary bookkeeping is simply a process of addition and subtraction. It is good enough, as far as it goes, to measure values in a crude way. but it would not answer my purpose. My bookkeeping bears the same relation to the market value of property that idealism does to materialism in philosophy or art. The market value of property is often but a crude caricature of the actual value. The faded book-mark my mother gave me would not be, in the conventional bookkeeping, an asset at all; in my bookkeeping it figures high. There are no values so genuine as those that are purely sentimental, for sentiment constitutes a large part of the value of life.

"The trouble with the ordinary book-keeping," continued the billionaire, "is that it deals almost entirely with nominal values, only incidentally with real ones. The ordinary bookkeeping expresses value in symbols of money, but money is only a certificate of wealth, and must not be confounded with the real thing. It is a peculiarity of the dividends which I receive on my stock that they are paid, not in certificates of value, but in actual wealth itself.

"Ask many men how much they are worth, and they will count their stocks and bonds, which simply show what their property would bring in the market. These are only nominal or potential forms of wealth, and must not be mistaken for the real thing. There are people who prefer to get rich in this way. They have a certain environment of

comfort and luxury, but beyond this their wealth is largely a matter of book-keeping. They have mines which they have never worked, railroads upon which they have never ridden, horses which they do not drive or ride, books that they do not read. It is undigested wealth. Then there are the misers who hoard their certificates. That is what I call stagnant wealth; it does not circulate in the community nor in their own lives.

"As to my method of bookkeeping," said the billionaire, "you can form a better idea of it if you will step into my private office." Here I counted five large ledgers. "These," he said, "are my stock ledgers."

He took down one. It was entitled "Inherited Stock."

"You will see," said the billionaire, "that a large part of my wealth was inherited. Some of it has been in the family for centuries. The original deeds have been lost. Not exactly, either. The original deeds, I suppose, have really been preserved, but the doers have been dead so long that their names have not been recorded; and it would be difficult to say in many cases to which one of my one hundred thousand grandfathers I am indebted for some of these special bequests. My little boy has among his playthings a number of blocks which he uses for building purposes. On each of the cubes there is a letter. Now, it is easy to tell where the blocks came from, for his aunt bought them at a toy store; but to tell where the letters came from is a different task. They are a part of our family symbols. You will not find a Chinaman or an African or an Indian with just these things in his household stock. They came down through our family branch. They are of enormous value, and it was no fool that invented them; but it is almost as difficult to tell how we got them as to tell how our ancestors came to walk on their hind legs instead of on all fours."

One section of the book was entitled "Interest-Bearing Stock."

Under this head I found a long series of entries, among which were Marathon, the Parthenon, the Hermes of Praxiteles, the Greek Drama, the Coliseum at Rome, St. Peter's, the Cologne Cathedral, the Louvre, the British Museum, the Mayflower, Bunker Hill Monument, and a great number of other items, followed by algebraic symbols.

"Do you mean to say," I asked, "that you are drawing dividends from all this stock?"

"Certainly. Why shouldn't I?"

"But how do you establish your ownership?"

"Nothing is easier if you make the proper distinction between exclusive ownership and shareholding. People would rightly set me down as insane if I claimed exclusive ownership in any of these things, and there would be a great protest from all the legitimate heirs; but I should certainly be insane if I surrendered any of my rights as a shareholder. There is not a civilized court in the world that would not sustain my claim. My dividends from this stock of inherited wealth are as certain as any dividends in the world. They are 'gilt-edged.' might be called 'dividends of civilization.' They are not paid in cash, but in something better-in enjoyment, in sentiment, in knowledge, in beauty.

"One essential element of wealth many people have not discovered—that is, that we can share the better part of our wealth with others without becoming poorer ourselves, and that we may share the wealth of others without impoverishing them. It is easily explicable when we give up the idea that wealth is absolute or exclusive possession, but simply an unselfish form of shareholding.

"My inherited wealth," said the billionaire, "is not something which separates me from my fellow-men, but something which links me to them. I have never understood why wealth should make men exclusive. All true wealth radiates, is centrifugal, distributive. Under the conventional view of inherited wealth the fewer heirs the better; but under the true view the more heirs the more people are enriched, and therefore the more is wealth multiplied."

I asked my friend what was the meaning of the algebraic symbols in the stock ledger.

"Oh, that is a peculiarity of my book-keeping; it would puzzle them at the

clearing-house, but I understand it myself. It is impossible to express or even to suggest in arithmetic, especially with the dollar sign before it, the value of the Parthenon, or the Sistine Madonna, or the Cologne Cathedral, or of a thousand other things which I have entered in my inventory in the stock ledger. I simply indicate them by algebraic symbols, which suggest their historic, educational, or sentimental values.

"I, as a shareholder, draw dividends from all this stock, none of which is listed on the Exchange. Some of these dividends are self-paying. I don't have to cut Bunker Hill coupons on the seventeenth of June, or Liberty Bell coupons on the Fourth of July; they are paid to me with mysterious regularity in the processes and growth of American freedom.

"But I suppose you would like to know." he said, with a characteristic smile, "how I have come to acquire some more modern forms of wealth—wealth that figures, for instance, in Wall Street, and some that does not figure there. That is listed in these other books, which you are perfectly welcome to see."

He took down the ledger marked "Collateral Stock Book."

It was a ponderous tome. He turned over the pages rapidly. The entries of stock were appalling in number and vol-Steamship, electric light, American steel, Western Union, various iron, copper, and coal mines, nearly all the most important railroads in this country and in Europe, and a vast array of manufacturing stock, filled the pages of the ledger. I was amazed at the extent of the inventory and the dividends. billionaire noted my surprise, and said, with a laugh, "There is nothing sensational about this list. There is not one of these properties in which I am not a shareholder. I am not an exclusive owner of any one item, and have no desire to be; because, if I owned them in any such sense, they would own me, and I am not willing to place myself in the position of being owned by my wealth. But I am a shareholder just to the extent that I use them, and I draw my dividends by using them.

"All of these things and a thousand

more are a part of the gain of history and of the development of our age. They are a part of the total stock of our civilization. I am much obliged to Robert Fulton, George Stephenson, Richard M. Hoe, S. F. B. Morse, Thomas Edison, Andrew Graham Bell, and all the rest, for making me a shareholder in their inventions. I have not had a share of stock in any of the companies organized to propagate and work these inventions for the sake of making money; what I want is the use of these inventions themselves, for they have rendered a vast amount of money unnecessary. Stop and think how much it would cost you in time and labor to do for yourself what these things do for you. You pay a cent for a daily paper. It has taken a printing-press, a railroad, a telegraph, a telephone, a typewriter, and the combined arts of handwriting, stenography, and printing, to produce it. Grant that out of forty-eight columns only twelve are worth reading; yet, to create all the instruments and agencies necessary to collect and print and publish those twelve columns, millions of dollars were ex-That is to say, you pay one pended. cent for the use of all those millions.

"When people say to-day that a man is as 'rich as Crœsus,' they apparently do not know what a poor man Crossus was. He was not rich enough to travel by railroad or by steamboat or automobile. For traveling on land he was absolutely dependent upon a horse. His house was not lighted by electricity, gas, or petroleum. He was too poor to buy a watch, a pair of spectacles, or a box of matches. Not all the money he had, or could beg or borrow, would have sufficed to secure to him what are to-day regarded as necessities of life for even a poor man. He was fortunate in living in a country where nature was prodigal. but he could not command all the varieties of food at the same time which a poor man can command to-day-fresh strawberries from Florida, potatoes from Bermuda, bananas from the West Indies, oranges and fresh figs from California.

"The annihilation of distance in the days of Crœsus was secured only by a miracle, and enjoyed only by gods with winged sandals or winged steeds. It

would have taken Crossus three months, as it took some of our Puritan fathers. to cross the Atlantic; but in one of the steamers in which I am a shareholder I have crossed it in five days, eleven hours. and forty minutes; and the man who traveled by steerage got there just as quickly as I did. If it had rained drachmas or dollars in Greece for forty days and forty nights, until the gold was as high as the housetops, Cræsus, if he had invested the whole amount, could not have purchased the speed which an Irish immigrant can buy for thirty-five dollars. What a slow figure the swiftest of his heralds would cut to-day! A message can be sent from New York to London under the ocean quicker than the news of the battle of Marathon could have been carried twenty-five miles overland when that victory for freedom was won. And this modern messenger is within the means of the average man. It costs but twentyfive cents a word to send an ocean cable. By buying from the United States Government a little picture of Washington, costing just two cents, a mother in Maine can send a letter to her boy in San Francisco or the Philippines.

"You ask me how I draw my dividends of use from my collateral stock. I draw them when they mature; when I want them; that is to say, when I use them. To illustrate: Yesterday I took the Staten Island ferry to New York, then the Subway to the Grand Central Station, then the Empire Express to Buffalo. I bought three newspapers, one costing three cents and the others one cent each. I arrived at Buffalo at 4:45, having made the trip of four hundred and forty miles in eight hours and fifteen minutes. sent a telegram to New York which cost twenty-five cents. My expenses that day, exclusive of meals, were as follows:

Staten Island Ferry	\$.05
Subway	.05
Fare to Buffalo	9.25
Newspapers	.05
Telegram	.25

\$9.65

"Thus for the sum of \$9.65 I had the use that day of a ferryboat, the subway, the railroad from New York to Buffalo, three newspaper plants, and a telegraph line of 440 miles. Count up now the cost of

the ferryboat and the cost of running it, the cost of cutting the Subway and running it, the millions invested in the equipment of the New York Central Railroad, and the capital and cost of operating the three newspapers and the telegraph, and you will see that for the sum of \$9.65 I had the use of many millions of dollars. I did not have to bother myself about owning and directing the roads or the telegraph or the newspapers. I owned the use of them, and that is enough. Of course a good many other people have the same advantage, but that is one of the pleasant things about it. The worst kind of wealth which any one can possess in material goods is that kind of wealth which is so fenced off that nobody can enjoy it with him.

"Last summer I secured possession of a Swiss lake and three conspicuous mountains. I have taken possession of them in just that way. Whenever I am there so that I can climb the mountains and sail on the lake, they are mine; no-body can rob me of them. When I leave them, I take a certificate of ownership with me; it is the picture I carry in my mind. As I shut my eyes and look at that picture, it is priceless."

The billionaire took down a third volume entitled "Common Wealth Assets." "Here I enter," he said, "my forms of cosmic wealth. No man can be considered really rich in this day and age whose wealth is confined to one planet, and that the planet on which we stand. Purely mundane wealth would be absolutely discredited in the system of universal exchange if it had not solar indorsement. The greatest source of my wealth is some ninety-three millions of miles from here, a tract of space so remote that I have never traversed it except by eyesight. Yet every morning with unfailing regularity my share of the daily product of the vast cosmic furnace is delivered in golden beams and billets which make the gold of Ophir or of the Klondike seem as dross in comparison. This gold does not need to be sent to the mint to be coined, or to the jeweler's or to the goldsmith's to be worked up; it is delivered ready for use. And it is useful, not in gilding the surface of life, but in the promotion of life itself.

can store it, too, in field, barn, and cellar. It is not only pure wealth in itself, but it can invest other things with wealth and beauty. Generously diffused over the soil, it is the best known fertilizer. With wonderful energy it pumps water into the clouds for irrigation. Every beam is a sheaf of color. Night and morning it paints magnificent scenery on the cloudy canvas it has spread. It is an incalculable source of light and heat, wonderfully democratic in its beneficence; shining alike on the prince and the peasant.

"This cosmic wealth is a part of the common wealth. It belongs to all. Even the animals can draw their dividends here. No one can corner this stock of gold, or put a fence around the sun and secure a monopoly of the product to be delivered at so much a beam. "And if there is anything which excites my indignation," said the billionaire, "it is when men seek to deprive others of their due and natural share of this solar wealth. In our great cities even sunshine has a market value, and the worst form of poverty is when men and woman are forced to live in slums where they contract tuberculosis and other diseases because they cannot pay for sunlight.

"The atmosphere is another form of common wealth, a part of my birthright, on which I began to draw as soon as I was born. What right has any one to deprive me of my just share of it, or to poison or soil my allotment of it? It seems to me that that is not a very dangerous form of socialism or of municipal or State control which so orders the construction of cities and houses that the individual occupying them shall not be deprived of his natural share of the common wealth, the cosmic gifts of light and air.

"Then there are the stars, which constitute my cosmic jewelry, the only diamonds and gems I possess; and the moon, which pours out a monthly supply of free silver, and lifts the tidal billow.

"There are the ocean and the great international seas, which cannot be bought up. They are a part of the common wealth. Nations may claim a strip of them on the coast, but they are a part of the highways of the world. We are all tenants in common of sky and sea. Perhaps the time will come when we shall make it impossible for one man to secure vast tracts of this earth to the utter exclusion of everybody else, and when the birthright of every individual to a share in the globe on which he is born will be recognized.

"You see, I hope," said the billionaire, "that I was right in saying that a very large part of my wealth grows out of my relations to the mutual life; and because it is mutual it is equitable."

"I understand now," I said, "the distinction you make between legal ownership, between a mere title to wealth and the reality of use or enjoyment. I understand, too, the emphasis you place on shareholding, or what may be called social or corporate wealth, and your dividends of civilization and common wealth; but are there not certain forms of your wealth which are personal and which cannot be made over to others?"

"Yes," he said, "there are some forms of wealth which cannot be transferred. There are possessions which are purely individual, and they are some of the most valuable things which a man can call his own. I have another stock book in which I enter these personal assets."

He took down the "Personal Ledger." "In the first place, there is my stock of good health. You could not list it in Wall Street or anywhere else; it has absolutely no exchangeable value to anybody else, except the companies in which my life is insured; but it is of immense value to me. I know a man who would give a million dollars at once if he could Poor fellow! he is almost bankrupt in his digestion. He could buy out Washington Market any day in the week and not feel it; but if he ate a good square meal he would feel it quickly enough. If there is anything he envies, it is the robust health of some stalwart laborer on his place who is working for the prevailing rate of wages, but who might earn forty thousand dollars a year if he could make over his breathing and digestive apparatus and other physiological appurtenances to this millionaire who is rich in gold but a pauper in health. This man parted with his health to get his money; now he would like to part

with his money to get back his health. It is remarkable what a spiritual and moral quality there may be in good health; it affects one's relation to the entire universe. 'Give me health and a day,' said Emerson, 'and I will make the pomp of emperors ridiculous.'"

I noticed that another stock listed as a purely personal possession was his "stock of knowledge." But the billionaire turned over those pages rapidly and smilingly said, "I don't want you to know just how poor I am. I wish I had invested a good deal more in that direction. But I appreciate its value, if I cannot illustrate it.

" Of course knowledge in my system of bookkeeping is capable of double entry; it is something you can impart, and therefore you can share it with others; but, on the other hand, it is something which you cannot acquire without earning it. The earning capacity of people differs: but to the extent that you earn anything in this field, you must earn it yourself. It is therefore a purely personal possession. It is just here that some of the nouveaux riches find themselves up against a wall. They have learned how to make money, and got some additional knowledge in the process; but they have not acquired knowledge of a better sort or developed their capacity to get it. They can buy a book in a foreign language, but not the capacity to read it; they can buy a celebrated picture, but not the capacity to enjoy it; they can buy a ticket for the opera, but not an ear for music. A man's mental outfit, whether by natural endowment or acquisition, is his own; it is a part of his indestructible capital which cannot be burned nor stolen from him. It is a form of absolute wealth so purely personal that he cannot even bequeath it in his will. I sometimes regret that Nature is so inexorable in this respect, and that so much knowledge and capacity must die with the man who possesses it.

"I think," continued the billionaire, turning away from his Personal Ledger and speaking in a positive but purely impersonal way, "that our American millionaires must, on the whole, be credited with an appreciation of the value of knowledge in its broadest sense as an

element of power. One of the best evidences of this is the vast amount of money which has been given by our rich men for libraries, schools, colleges, and other educational institutions, and to encourage the pursuit of science and art.

"The millionaire of the new school has also discovered that if he cannot personally assimilate all his material wealth, he is not obliged by law to keep it. He can enrich himself by giving it away. is not so easy a thing to do as it may seem to you. For some men it is a harder task to give away their money than it was to make it. It is very hard for some plutocrats, after having spent forty or fifty years in exercising the power of getting, suddenly to turn around and begin to exercise the power of giv-All the muscles of their benevolence are weak and flabby. Their thought has not been exercised in that direction. One of the terrible dangers of getting too much gold is that it may ossify the sentiments, and one may get a disease which I call the 'plutocratic clutch.' It is what I may describe as lockjaw of the hand. It is a disease in which it is impossible for the hand to relax into the open palm.

"I knew a man who had this disease. The doctor said to him, 'You will never be able to open your hand till you have learned to open your heart.' An operation on the heart, you know, is a delicate piece of surgery, but by the process of psychotomy it is possible. He told me what a struggle he had to give away so small a sum as five dollars. He had to be persuaded that somehow he was going to get some interest on this investment in heaven, and was flattered by the fact that his name would appear in the papers. He told me the story of his struggle from miserliness into generosity, and it seemed to me far more heroic than any story I know of—a struggle from poverty into wealth. He learned the hardest lesson of his life, to give for the sake of giving. Some of his gifts were necessarily public; a large number were of the left-handed kind; his right hand did not know what the left hand had done. And then he told me, with a warmth in his voice and a little moisture in his eye, that in getting his wealth he had never experienced a

hundredth part of the happiness he had in giving it away."

The billionaire put up his stock books, but the title of another book caught my eye, "Castles in Spain."

"Ah," he said, laughingly, "you journalists have reduced curiosity to a fine art."

"Well," I said, persuasively, "you have told me about your possessions in France and Switzerland and elsewhere, why not tell me of your castles in Spain?"

He took out the volume. I noticed that a good many of its pages were canceled, but some were still fresh and fair

and in his own handwriting.

"This book," he said, "nobody sees but myself. It is kept in my private safe. My investment in natural scenery both in this country and in Europe is a form of investment in real estate. But my castles in Spain are not what you call 'real property.' Nevertheless, I am accustomed to regard them as one of the most valuable of all forms of personal wealth. These castles are of my own architecture and my own building; they have a peculiar fascination for me. I do not have to get permission from the building department to put them up. I do not insure them, because they are safe from damage by fire and water. They have a habit of dissolving now and then, but they generally fade away so gradually that you do not know that they are gone. What to some people is the capital defect of these castles is to me their supreme excellence; that is, that they are purely imaginary. They can be reared in a night and are ready at once for occupancy. There is nothing more valuable for the creation of wealth and happiness than the faculty of imagination; because with it you can create wealth out of material which is absolutely devoid of market value. There is no grander resource for a nominally poor man than, by a mixture of hope and imagination, to be able to change his condition and environment. If he is not architect enough to do this himself, by the investment of a dollar he can secure the services of Walter Scott, Shakespeare, Dumas, Van Lennep, Goethe, Victor Hugo, Sophocles, Euripides, or Homer. Or, if he likes some more modern literary architect, he can easily find one who will create a new environment and atmosphere for his mind, so that he can secure one of the fundamental conditions of happiness, the capacity of escaping from yourself.

"How poor the world of literature and life would be if it were not enriched by the imperishable creations of the imaginations and the visions of the seers! And in these days the man who is nominally poor can buy them almost as freely as the millionaire, and there are public libraries that now form part of the common wealth."

The billionaire paused and looked at his watch. I took the hint.

"I have not begun," he said, "to get through my catalogue of the sources of wealth. I have not mentioned the wealth of friendship, the joy of work, the incalculable resources of affection, and scarcely touched on the treasures of memory. But you have some idea now of my method of bookkeeping, and can calculate the value of some of these things in life without any help from me.

"Do not quote me as saying anything against money or the men who have the capacity for getting it. When society is somewhat better constructed, we shall have more money, not less; and perhaps it will be better distributed. But the great advantage of my form of book-keeping and of estimating values is that a man can be a billionaire on a very small amount of money."

As I took up my hat to leave I cast a glance at a few shelves of books which the billionaire had in his counting-room. They were most of them devoted to political and social economy.

"I am not tied up," he remarked, "to any particular school of political or social economy. A man who becomes a doctrinaire in this comparatively unexplored field is soon lost in a maze of crude technicalities, and may become a Philistine before he gets through. But I should be ungrateful not to acknowledge my indebtedness to this volume." He took down a little book, with a title neatly lettered in his own hand: "Josephsson's Galilean Economics." "It is based on the gold standard, you see: 'Do unto others as you would have them

do unto you.' Some of its fundamental principles are: To him that hath shall be given. That is a recognition of the capacity of the individual to enrich his own personality. Every treasure which he has secured only makes it easier to secure something still higher and better.

"Other principles are: A man's life consisteth not in the abundance of the things he possesseth.

- "What shall it profit a man if he gain the whole world and lose his own soul?
 - " He that loseth his life shall find it.
 - "It is a book of parables and precepts.

The principle of reciprocity on which its social economy is based is well enunciated by one of the followers of Josephsson: Let every man bear his own burden. That is a recognition of individual duty. And then there is the reciprocal principle:

"Bear ye one another's burdens, and so fulfill the law of Christ.

"A man who follows Josephsson," said the billionaire, as he took my hand, "has laid up his treasures where moth doth not corrupt, and where thieves do not break through and steal."

HOW ONE CHURCH REORGANIZED ITS SUNDAY-SCHOOL

BY H. J. HASKELL

"HOSE don't look like quarterlies," said the visitor; "what are they?"

"Class books," replied the superintendent, briskly. "We aren't buying quarterlies any more. The girls used them, sometimes. The boys didn't, except in school. But that was only one trouble. The real objection was that we wanted a school of religion—a school, mind you—and not a lot of sermons on miscellaneous topics with the verses printed in the quarterlies for texts. So what we've got now is a graded school. Let me show you."

Though it lacked a half-hour of opening time, pupils were already coming. In a corner a group of girls were bending over a table drawing maps, while a teacher stood outside the circle, occasionally making a suggestion.

"We have to come early to get these maps drawn," she explained. "We are so busy in the lesson hour, you see."

The superintendent stopped a boy of thirteen and asked for his book. It was made of blank leaves in a pair of black, cloth-bound covers, technically known as a "manuscript binder." A printed slip pasted on it bore the words, "Beacon Hill Sunday-School, Junior Department, Grade D." Written carefully beneath was the title: "The Story of God's Later Messengers."

"You see we aren't confined to the Bible for our material," said the superintendent, as he opened the book." "Grade C of this department is studying the work of the Apostles, under the general title of 'The Story of God's Early Messengers.' But we don't see any reason for stopping with them, as if their work were something altogether different from modern missions. This church doesn't recognize any such gap in religious development." He was running over the pages as he spoke. They were removable at will, by untying the string that bound them, and additional leaves could be inserted. At the end of the year, he explained, they could be bound in heavy paper, a new label could be pasted on the binder, and it would be ready for the next year's work.

"Don't you remember, when you were a boy," he said, "that it was always a lot more fun to do a thing yourself, no matter how badly, than to have some-body else do it for you? Now, with this scheme the boy makes his text-book himself. A prepared quarterly is like a mechanical toy that runs itself and leaves the owner nothing to do. It's much neater and prettier than this, but it isn't half the fun. Is it, John?"

The owner of the book grinned and nodded.

"Let's see. These first lessons are

about India. Here's the map. Say, John, I don't know that I'd have recognized that as India if it hadn't been labeled. But that's all right. You'll be drawing a better one before you get through."

He turned to the first lesson. At the top of the page was written the title, 'What a Cobbler Did for God.' In the upper left-hand corner was pasted a small picture of a Buddhist temple.

"We ought to have had William Carey up there," put in John; "but we couldn't get his picture, so we used the temple instead."

Beside the picture as a memory verse were Carey's words: "Expect great things from God. Attempt great things for God." Underneath was a series of a dozen questions such as, "What was Carey's trade?" "What did he finally choose to do, and why?" "To what country did he go?" These had been hectographed by the teacher and a space left for the answers, which were in the boy's handwriting. The other lessons in the book were on other missionaries.

"But you use Bible lessons, of course?" the visitor inquired.

"Certainly. Only our notion is that the material ought to be adapted to the age of the pupil. We have organized the school into five departments according to age. The children from four to nine are in the primary department. The junior ages are nine to thirteen, the intermediate thirteen to seventeen, the senior seventeen to twenty-one, and there is an adult department besides. department includes several grades. The school has an average attendance of about two hundred and twenty-five, and we plan to have seventeen grades. As a rule, one teacher is to keep a class only a year. A teacher is supposed to be a specialist in one grade, and the classes are to progress from one teacher to another, just as they would in the ward school. All schools use this plan with their infants' department. We are going to try the same principle all through the school."

"And how do you 'adapt' your material, as you call it?" persisted the visitor.

"Well, take the primary department. The kindergartners are studying nature

lessons with the general idea of God as the creator, providing for the needs of his creatures. The older ones take up the same idea with Bible stories selected to illustrate it—God helping Israel through Moses and Samuel and David and so on. We assume that children between nine and thirteen are interested in great events, in heroic achievements. and that sort of thing. They don't care so much what men are as what they do. So we give them first the story of Hebrew history selected from that point of view, and follow it with the life of Jesus, and then with missionary history. All through these courses in the junior department. you see, we emphasize the more stirring things. The next department, the intermediate, is devoted to biographical studies of characters in the Old and New Testaments and of later times. Why, we include Francis of Assisi and Savonarola and Luther and Washington and Lincoln, just as much as we do Samuel and Elijah and Josiah. Adolescence. you know, is a time when boys and girls are especially interested in great characters and-"

"Hold on," the visitor interrupted. "Excuse me, but I know you're a busy business man, not a professor of pedagogy. Where did you get all these ideas? What is a Sunday-school superintendent supposed to know of the needs of adolescence, and all that?"

The superintendent laughed. "No," he said, "we don't claim any originality here. The ideas aren't ours. They are Pease's—and Short's. You see, Professor Pease, of the Hartford School of Religious Pedagogy, got out 'An Outline of a Bible School Curriculum' a couple of years ago, and Short got hold of it. The book suggests outlines for seventeen years' work for pupils of every age from four to twenty-one. We've adopted it bodily—and it works."

Then he told the story. When the new pastor came, two years previously, the Sunday-school was getting on in the usual fashion, without much interest or enthusiasm. After looking over the field, the pastor decided that the first need was increased efficiency of the teaching force. Few of the teachers were experienced or knew anything of methods. So

at the teachers' meetings he set them to work, not on the next Sunday's lesson, but on a book on pedagogy. That started the interest, and the second year about thirty persons began the study of Professor Coe's "Education in Religion and Morals." This helped them to a pretty definite idea of the aims of religious education and of the Sunday-school. Then, with some misgivings, the pastor ordered a half-dozen copies of Pease's "Curricu-The book discusses the characteristics of children and young people of various ages, and suggests courses adapted to these needs. Each course is merely outlined, with one or two lessons worked out in detail. For most of the lessons merely the title is indicated, and the development of material is left to the The pastor thought the book teacher. would afford a good basis for discussion. He hoped that within a year a few of the more enthusiastic and adventuresome teachers would be ready to discard the International lessons and experiment with the courses outlined. More he did not expect.

But a curious thing happened. After the first evening's discussion there was a general request for more copies of the "Curriculum," until twenty-five had been ordered. The teachers asked that the meetings be held semi-monthly, then weekly. At times a fifteen-cent lunch was served, followed by a two-hour discussion. Teachers were asked to work out new lessons from the titles suggested in the guide-book. Sometimes one of them conducted a class from the Sundayschool invited for the occasion while the others looked on and got or gave suggestions. The enthusiasm grew. Soon forty persons were attending the meet-

"This is the greatest religious revival the church has had in years," said a deacon.

It was the pastor's principle to let the teachers so far as possible do the talking. They soon began to ask, "Why can't we try this plan ourselves?" A few were timid, but the final decision, without pressure from the pastor, was practically unanimous. For the previous two years' courses had weeded out the teachers who had not the time or the

interest sufficient to do the work, and had attracted several efficient men and women to whom the traditional methods had never appealed.

The question of finance had to be considered carefully before a change was made, for the church was not wealthy, and, besides, it was directing all its energy toward the erection of a new building. Copies of the "Curriculum" would cost a dollar and a half apiece, but most of the teachers already had it. The binders, seven by nine inches, could be had for ten cents each, and the leaves for twenty-five cents a hundred. Small pictures for illustrating the lessons could be ordered from any one of several companies for fifty cents a hundred. The change, it was found, would entail no extra expense. So the reorganization was determined on, and at a special meeting a realignment of classes was arranged in order to conform the grades to the ages specified in the book.

Altogether, twenty-three classes were organized—one in each of thirteen of the seventeen grades, and, in some of them, two. There was already one adult Bible class. Three more were started. two in the "History of the Bible," with Dr. W. J. Mutch's fifteen-cent outline as a text, and the third in the "Evolution of the Religion of Israel," founded on Professor Cornill's scholarly little volume, "The Prophets of Israel," which was secured in paper covers for twentyfive cents. In the reorganized school about twenty-five per cent. of the pupils were above high school age.

"What have been your results?" the visitor asked, as the superintendent finished his story.

"Well," he replied, "of course I could tell you better after we have had a year's experience. But the thing that has impressed me most, as superintendent, is that every teacher is here every Sunday. They have to be, you know, to make the classes go, because they must outline each lesson in advance. On an average, about ten per cent. of the teachers used to be absent. In the three months that we've been running a graded school we have hardly had an absentee. To me that is more significant than the increased attendance of pupils, though for

the quarter that has been over twentyfive per cent. above last year's record. But talk to some of the teachers."

They agreed with the superintendent. "Before we adopted the graded work," one of them said, "I had about decided to give up my class. It seemed to me that the International lessons weren't getting us anywhere. I was quite discouraged. But things are different now. The pupils take hold of the work better."

"Take hold"—that was the common expression. Parents, they said, had spoken of the change. In one family that had been quarantined because of scarlet fever, the children had insisted on having the lesson-sheets sent in every week so that they could paste the pictures on and hunt up the answers to the questions on Sunday afternoon.

The Superintendent led the way to a small room off the auditorium, into which children had been crowding before going to their seats. Hanging from wires were large sheets of cardboard, each bearing six leaves that had been removed from the lesson binders. The display leaves had been selected by the teachers as class exhibits. On some of them were carefully colored maps.

Others carried reproductions of famous paintings artistically arranged with the lesson material. All showed evidence of painstaking work. The children were commenting on them animatedly.

"We thought a little competition might help," the superintendent observed. "Once a quarter we propose to invite the parents in to see the exhibits. We hope to think of other devices later. But, after all, we are putting our main dependence in our graded curriculum. There are two ways of persuading children to come to Sundayschool, you know. One is to hold out all sorts of inducements like picnics and entertainments. The other is to make the teaching so interesting that they won't want to stay away. We're trying the second."

A few minutes later the school was deep in the lessons, drawing maps, hunting up Bible passages, looking over pictures, and answering questions.

"A church," the pastor said, as he looked over the auditorium, "is a complex organism, with many branches. This I call our educational department."

SPRING

BY MARY BALDWIN

Dawn and its silence draw a silver sigh
Far in the east where early shadows lie
All flocked and folded like soft peaceful sheep.
The Spirit of the Spring stirs in its sleep,
Breathes into life a misty floating sheen;
The willows dreamy drip of constant green;
Exultant beats a bird-heart o'er a nest,
Where dim, vague stirrings 'neath the tiny breast
Spell fresh the miracle of motherhood.
Ah, how the world is young! ah, how 'tis good!
To feel the new life flutter mystic wing;
Like to a lark to feel one's soul upspring,
Transpierce the very limit of the sky,
And toss its challenge to Eternity!

¹ Further information concerning this experiment in religious education may be secured from the Rev. W. M. Short, Beacon Hill Congregational Church, Kansas City, Missouri.

THE PRESENT DANGER OF FINLAND'

BY H. MONTAGUE DONNER

ISTORY does not furnish us with any more striking example of the inherent force of united popular purpose, when intelligently and unswervingly directed to good ends, than the recent restitution to Finland, after six years of sore tribulation, of her ancient constitutional rights and liberties. The magnificent outcome of the Finnish nation's calm resoluteness is, in its largest sense, the triumph of an enlightened democracy over a mediæval despotism immensely superior in everything but moral prestige—the triumphant vindication, on the stage of nations, of high ideals over the gross forces of materialism and greed.

When we come to inquire closely into what Finland has gained through the historic ukase of November 4, we find that the country has specific grounds for self-felicitation. In the first rank of importance is the assurance that no further changes in the laws of the Grand Duchy will be attempted without the concurrence of the duly elected representatives of the Finnish nation, on whom is bestowed as a further safeguard the right of determining the legality of all governmental procedure, thus insuring the people a degree of direct control over legislation which they were far from enjoying under the old order of things. Further, the last traces of the evil system of the censorship have been doomed to disappear, a consummation which, however devoutly prayed for of old, had never before in the history of Russia's relations with Finland been more than partially and grudgingly granted. change is, of course, not so revolutionary as in Russia, where there has never hitherto been any organ for the expression of popular opinion, but it is, nevertheless, of enormous significance to the cause of liberty. The present task of remodeling the whole form of parliamentary institutions is a reform which for many years past all classes in Finland have recognized not only as desirable but as sooner or later inevitable. Under the old order of things the legislative machinery, based as it was on the antiquated system of the Four Estates formerly in vogue in Sweden, although up to the present time justified in its results, had not only grown decidedly too cumbersome, but had plainly, in the eyes of the nation at large, become inadequate for modern requirements, and was bound to give way in due course to a system answering more nearly and directly to the needs of a highly educated and progressive proletariat.

The present extraordinary Diet, therefore, will pass into history as the last of its kind, inasmuch as it has the unique function of decreeing its own end and taking measures for the creation of a successor very differently constituted, as well as endowed with far wider powers. Before it passes to its rest, however, it. will have enacted other most important legislative measures—laws to secure absolute freedom of the press, of speech, of person, of public meeting and organization, such statutes to be guaranteed inviolable by being placed among the fundamental laws of the land, all future attacks on which by the Czar or his Ministers are to be guarded against by the adoption of wording so precise and clear that it cannot possibly admit of ambiguous construction.

It would seem that, having thus gloriously won back their freedom without bloodshed, the Finlanders would now naturally unite to take common measures for the security as well as the improvement of their autonomous institutions. It is here, however, that we are confronted with a spectacle that is as

¹ The author of this article is a nephew of Senator Otto Donner, of the Finnish Government, has been prominent in Finnish-American organizations, and has contributed other articles on this general subject to The Outlook.—THE EDITORS.

disconcerting and saddening to the lovers and admirers of Finland as it is new and startling in the history of her people, hitherto universally admired for their unflinching adherence to law-abiding procedure and orderly protest, even in the face of most bitter and long-continued oppression and studied provocation. It would really seem as if the Finnish national character, so entirely admirable under adversity, had suffered a species of moral disintegration under the stress of sudden prosperity. It is lamentable to find that just at this juncture, when the fortunes of Finland, in the face of the partial triumph of the reactionary forces in Russia, may be swaying in the balance, the Grand Duchy itself should. be rent by factional bitterness and mistrust. But so it is, and the situation needs study in a new light.

In former articles in The Outlook (September 20, 1902, and January 10, 1903), I have shown how Finland was roughly divided into the rival camps of Svekomans and Fennomans, and how, in pursuit of the Machiavellian policy immemorially dear to Russian statecraft, of divide ut imperes, it has always been the aim of Russia to widen the breach between the Swedish and Finnish speaking elements in order to render easier of accomplishment the ultimate purpose of destroying Finnish autonomy altogether.

Most unhappy, indeed, and far-reaching, have been the effects of this policy of darkness and double-dealing-effects that have, alas! come to light with startling clearness now that the heavy hand of the tyrant has been shaken off, and the Finns find themselves left to work out their own salvation. Now it is only too manifest how the constant spectacle, during six years of contemptuous disregard of the rights of others, as evidenced in official malversation, chicanery, and bribery, and in the system of police espionage and the encouragement of paid political informers; of the insidious posing of the Russian Government as the particular friend of the unemployed working classes, to whom it more than once distributed money and food drawn from the funds collected in previous years by the Finnish State and provincial

governments; and of the systematic setting of class against class, inevitably worked subtly and almost imperceptibly to undermine, particularly among a portion of the laboring classes, that stern sense of personal independence and integrity, combined with respect for the law, which has always been so marked a characteristic of the Finnish race.

It is, of course, to be expected that Finland should now be in special peril from its outer enemies, among the most active and influential of whom must naturally be counted the Russian officials who have just been forced out of the posts upon which they had for so long illegally fattened in the Grand Duchy-from Prince John Obolensky himself, and the ousted governors of Finnish provinces, down to the merest provincial hanger-on of the alien police heads. In the natural order of things, however, it is to be expected that the Finnish cause in St. Petersburg would triumph over all their machinations when guided by such competent and devoted men as the new Secretary of State for Finnish Affairs, General Langhoff, in whom the Czar appears to have great confidence, and his chief assistant, former Governor Björnberg, of Vasa, who perhaps more than any other one man possesses the most implicit trust of the Finnish people. But it is in truth sad to think that their task should be immeasurably increased. and their success put in serious jeopardy, by internal foes of the country. such is the unhappy truth. Instead of the prudent, well-considered co-operation of all classes of the community in the work of rehabilitation which the previous history of the country would lead us to expect, admirers of Finland have now the chagrin of seeing a resolute attempt made by a fraction of the new commonwealth to arrogate to itself a controlling part in the work of reorganization. The ugly specter of social fanaticism, under the red banner of Social Democracy, is seen struggling to rise to power on the ruins of the overthrown despotism first erected by the mailed fist of Muscovy, and so lately reviled by the very faction that would now take its principles of action as their models.

The Social Democratic party is a new

phenomenon in Finnish politics, and, as I have endeavored to show, may be regarded as the direct outgrowth of the Russian misrule of the past six years, with its studied policy of fomenting not only party but class discord. Founded partly on legitimate grounds of disaffection, such as lack of representation in the Diet and denial of the right of suffrage, it has gone to school under an apt master of violence and treachery, and it would be strange if, finding itself suddenly become master of its destinies, it did not yield to excesses in its new and unwonted taste of power, unbalanced as vet by the restraining influence of any adequate sense of responsibility.

The youngest by far not only of the political parties of Finland, but of the various national entities composing the great and rapidly growing modern phenomenon of the Socialist body which is seeking to establish a common brotherhood of propaganda and action against the monarchical and military governments of Europe, the Social Democracy of Finland (the extremists among which, during the Russian régime of terrorism, had declared an alliance with the Socialist-Revolutionary party in Russia) is, nevertheless, the first section of that body to be placed in a position where it can exert an immediate and powerful influence in the creation of new forms of government; and for that reason its methods of procedure and their results must be watched with particular interest, especially by the neighboring nations. It must be confessed, even by those weary of autocratic misrule and military despotism, with their everlasting international rivalries and the heavy burden of taxation which they entail, that so far, in the fierce light which thus beats upon them, the Finnish Social Democrats have not cut a very dignified or even respectable figure.

It is not that the political programme of the party is beyond the demands of reason. As a matter of fact, their demand for a unicameral legislature and universal suffrage seem to have commended themselves so strongly to the Finnish people as a whole that they have been practically acceded to by the

Mechelin Senate and the special legislative committee appointed by the Diet to prepare the official scheme of governmental reforms, though there exist minor points of difference that have yet to be adjusted. It is their studied attitude of defiance, their absolute disregard for any interests but their own-in other words, their lack of a communal conscience—their appeals to passion and prejudice, their preaching of the gospel not merely of social discontent, but of class hatred and racial animosities, together with their many deeds of actual violence-that constitute the Social Democrats a most potent menace to the security of the Finnish State. This menace is greatly increased, owing to the fact that the Government is without a military arm to quell any belligerent demonstration on the part of organized labor on account of the abolition of the Finnish army by the Russian bureaucracy in 1901 and the further unfortunate circumstance that the gendarmerie and police force are undergoing reorganization from top to bottom after their wholesale corruption during the Muscovite tyranny. It is this unhappy state of affairs that has made it easy for the Social Democrats to send agitators throughout the country inciting the more ignorant and credulous of the peasantry against the upper classes in general, who, after all, are the most liberal-minded and democratic in Europe, and recounting the bloody exploits of the Russian "mujiks" in the distant provinces of the Empire as something worthy of admiration, if not actually of emulation. Under the circumstances it is not to be wondered at that the demeanor of the lower classes in both town and country has shown signs of change for the worse, and that instances of violence on the part of workingmen against others of their number who did not share their views have been frequent of late in Helsingfors and other towns. Matters actually went so far that prominent agitators made a public appeal in the capital for the formation of a gigantic organization of school-children over fifteen years of age to withstand the "slavery" imposed upon them by parents and teachers, whom they were openly called

upon to defy, so that they should learn to have "backbone" in preparation for the struggle for their full rights when they should begin life! As for the existing young people's unions of one kind or another, they ought to disappear, inasmuch as they had the grand motto of "Equality and Liberty" only upon their lips!

It is satisfactory to note, however, that a reaction from all this preaching of hatred, malice, and all uncharitableness, and, incidentally, of extermination of the Swedish element, is beginning, according to latest advices, to make itself felt. Some of the leaders of the movement are beginning to realize that there is little choice between Russian tyranny and rabble rule. There is even good reason for believing that the Social Democracy of Russia has recently sent a protest to their too fervid sympathizers in the Grand Duchy, representing to them that they will only furnish an excuse, by proceeding to methods of violence, for the Russian Government to step in on the plea that the Finlanders have definitely shown themselves unable to rule themselves peaceably. However this may be, there is no doubt that the orderly element is bestirring itself to make the weight of public opinion felt, so that even the regular Socialist organ in Helsingfors, the "Työmies," is found urging the workingmen's and "Red Guard" committees to put only men who are well known and tried in positions of importance, and pointing out the dangers of allowing the anarchistic element to obtain too much prominence in the ranks of the party.

This is only as it should be, for it remains true, notwithstanding the success of the Nationalist movement in November, that there never was more urgent need of union among all parties in Finland, for in the background of the consciousness of her wisest statesmen there lies the constant apprehension of that

close interrelatedness of Finnish affairs with those of the Muscovite Empire which still makes possible a return, in case the popular movement in Russia should definitely fail, to the iniquitous policy of repression and destruction of constitutional guarantees. Hence the Constitutionalists, who hold the reins of power, must be alert to read the signs of the times. Apparently they are doing so, and are quite ready and even anxious to meet their political opponents halfway, for they recognize the great value of prompt action under the circumstances. They see that if the forces of reaction in Russia, as exemplified most strikingly in the baleful figure of Durnovo, or in that of Trepoff, triumph before the work of the Diet is complete. the whole labor of the Finnish patriots might be rendered abortive. The possibility of such a catastrophe should not be lost sight of, and, looking to such an eventuality, it would seem as if the Diet ought to hold Time by the forelock, and be ready with some constitutional device providing for the instant call of a National Assembly elected by direct universal suffrage, and so secure a legislative body thoroughly democratic and representative of the whole nation, which could then take action with the absolute certainty that in whatever interpretation it should place upon the necessities of the situation, or in whatever measures it should deem necessary for the salvation of Finland, it would have the united backing of the people.

May we not reasonably hope, however, that the Czar's Government will not dare, after all, to flout a second time the outspoken opinion of civilized mankind in favor of Finnish autonomy, even if it should not hesitate to defy the reawakened wrath of an outraged people, this time determined to fight to the last gasp for the sacred hearths of a free race and the cherished banners of civilization and progress.

Comment on Current Books

Bowdoin Boys in The first of the recent exploring expeditions into Labrador the wilds of Labrador was made by a party of students from Bowdoin College in 1891. In a small schooner the main party visited the coast of the peninsula as far north as Hopedale, while four of the members went up the Grand River three hundred miles to the Grand Falls, undergoing great hardships and bringing back important material as a result of their exploration. The story of the trip is interestingly told by one of the participants. (Bowdoin Boys in Labrador. By Jonathan Prince Cilley, Jr. Cilley & Burpee, Rockland, Maine. 50c.; postage, 8c.)

Readers of the English "Spectator" will be Literary Criticisms grateful for another selection from the short essays of Mr. Richard Holt Hutton, so long identified with that admirable journal, and one of the most accomplished literary journalists of his time. This selection covers a wide range, and brings out the diversity of Mr. Hutton's gifts, the breadth of his sympathies, and the ease and clearness of his style. He was a journalist in his attitude rather than in the manner of his work; for many of these short essays are stamped with genuine literary quality. He is at his best in dealing with such subjects as Wordsworth, Cardinal Newman, Carlyle, and Arnold, and his best means keen criticism, sympathetic interpretation, and an eminently readable style. This volume will not add to Mr. Hutton's reputation, but it will give pleasure to the large group of readers who have learned to enjoy his intelligence, lucidity, and the air of elevation which pervaded everything he wrote. (Brief Literary Criticisms. By the late Richard Holt Hutton. Selected and Edited by his Niece, Elizabeth M. Roscoe. The Macmillan Company, New York. \$1.50.)

Cache la Poudre

A Third Avenue melodrama de luxe, with a Wall Street villain, a beautiful but depraved enchantress, a youthful hero who, foully wronged, becomes a cowboy of pure heart and vast strength, and a culminating thrill at the Custer massacre followed by a wedding—all bound in buskin ornamented in cowboy style with leather fringes. This edition is equivalent to admission to the boxes; for those who are content to sit in the stalls there is a plainer edition somewhat less lavishly illustrated. (Cache la Poudre. By Herbert

Myrick. The Orange Judd Company, New York. \$5. Postage, 20c.)

While memory remains to Called to the many who suffered in the Civil War, both North and Field South, pictures are brought out and hung before us, keeping alive the pathos and the occasional flashes of comedy of forty years ago. Mrs. Thruston evidently writes from intimate knowledge. The story opens with a bright scene—the girlish bride running down the road to meet her husband, unconscious of the bitter news he brings of a war that will darken all their future. It is a story of the hardship of those who stay at homeand we realize that it is not overdrawn. The charm of it lies in its perfect naturalness, and there also is the secret of its intensity. (Called to the Field. By Lucy Meacham Thruston. Little, Brown & Co., Boston. \$1.50.)

In the painful situation of a The Castle man publicly reputed a coward of Lies because his nerve became paralyzed in a critical situation, who rushes into reckless adventure with a bare hope of retrieving his self-respect, there seems to be an excellent chance for a psychological study. But the plot soon plunges into an intricate and crudely wrought tissue of incidents too hard of belief to appeal to the imagination. The Bulgarian-Macedonian crisis furnishes the raw material. (The Castle of Lies. By Arthur Henry Vesey. D. Appleton & Co., New York. \$1.50.)

This compact little dic-Elson's tionary—or perhaps, Musical Dictionary more accurately, expanded musical vocabulary or glossary—is rather more inclusive than most books of its class. Its defects are not difficult to find: but its merits will be more evident to those who use it. We cannot quite understand why its list of composers and other musical artists should not include Americans. The book contains a list of musical terms in English with their Italian equivalents. In a note Mr. Elson presents a very reasonable argument for the retention of Italian as the language for musical directions. (Elson's Music Dictionary. By Louis C. Elson. The Oliver Ditson Company, New York. \$1.)

Expositions of Holy Scripture

These five volumes confirm the impressions recorded in the note recently made upon their predecessor. Each contains on an average between fifty and sixty short ser-

Digitized by Google

mons, amply justifying Dr. Maclaren's reputation as a master of expository preaching. In his treatment of the Old Testament fruitful lessons for to-day are discovered in apparently barren texts concerning ancient events, while religion and morality are fused together, as in the preaching of the prophets. In the New Testament, while his standpoint is that of the mediæval theology, to the extent of maintaining that Jesus could not be the Saviour of the world unless supernaturally born, this feature appears but occasionally; religious and moral emphasis is continuous. These volumes are a treasury of thought for preachers, Sunday-school teachers, and all who study the Scriptures for a practical purpose. (Expositions of Holy Scripture. By Rev. Alexander Maclaren, D.D., Litt.D. The Books of Isaiah and Jeremiah, 2 vols. The Gospel of St. Matthew, 3 vols. A. C. Armstrong & Son, New York.)

Feeling, with Prolegomena This substantial volume from the prolific pen of Dr. Denton J. Snider carries the reader through the ground-floor of psychology, as introductory to the upper stories of will and intellect. The conception of psychology here presented is distinctively spiritual, and carries a religious value. The universe itself is regarded as psychical, and one is reminded of Virgil's well-known lines:

"Immanent spirit sustains the All, and infusing itself through the members,

Mind gives motion to mass, and blends with its hugeness of body."

Dr. Snider gives a fresh and original treatment to a familiar subject, and raises new points for thought with stimulating effect. To whatever criticism he may provoke his fellow-psychologists, he is most symmetrical. That "of all good things there are three," as Germans say, is a cardinal maxim with him. The distribution of his subject matter into triads, which appears in his preceding works, is carried through here, as there, into the uttermost details. Distinguished psychologists have protested against confounding psychology and philosophy. In the Prolegomena introductory to his treatment of Feeling, Dr. Snider goes further; he dethrones philosophy, and installs psychology in its place as "the science of sciences. But surely this is revolutionary. The thinking by which the Self creates an ordered universe out of innumerable fragmentary facts, including those of the very being of the Self, is a philosophical work, though the activity which undertakes it is psychical. We think Dr. Snider is rather too hard on his fellow-craftsmen, the psychologists, in saying that they "write and teach Chaos." On the whole, setting extreme claims aside, his treatment of Feeling does not, in substance, differ from that of current authorities; but it prefers to the hard beaten path walking on the springy grass that borders it. (Feeling, with Prolegomena. By Dr. Denton J. Snider. The Sigma Publishing Company, St. Louis. \$1.50.)

A useful handbook, cover-Getting Ready ing a different field from for Europe any single volume of which we know. It devotes a chapter to each country (including even North Africa and Asia Minor), and, without undertaking the full work of a guide-book, discusses routes, attractions, and all the large and important aspects of travel and sightseeing for that country. There are also outlines of history, information as to art and architecture, bibliographies, money tables, abundant maps, pictures of famous objects of interest, suggestions as to equipment, and much else. (How to Prepare for Europe. By H. A. Guerber. Dodd, Mead & Co., New York. \$2, net.)

The hen that hatched a duck Hazel of reappears in an English vil-Heatherland lage, where she figures as the anxious, dull-witted mother of a bright, impulsive girl. The latter does nothing worse than to engage herself to the wrong man, and extricate herself again with brave despatch. It is not surprising to find the heroine likening herself and Mr. Inderwicks, her lover, to Jane Eyre and Rochester. The thought had already occurred to us. The author evidently knows rural England as well as how to write a pleasing story. (Hazel of Heatherland. By Mabel Barnes-Grundy. The Baker & Taylor Company, New York. \$1.50.)

The subject of this bi-John Witherspoon ography by Mr. David Walker Woods, Jr., won distinction in more spheres of activity than any clergyman in our country before or after him. As minister for quarter of a century of the Scottish Kirk, he took a prominent part in the long struggle for popular rights which culminated in the formation of the Free Church in 1843. Called hither in 1766, as was his countryman, Dr. McCosh, a century later, to be college President at Princeton, the vigorous life he imparted to the college justified the expectation entertained at his advent, likened by Moses Coit Tyler to "that of a prince coming to a throne." Before the war for independence he bore a leading part in the organization of American Presbyterianism, mainly on the lines of the Church of Scotland. During the war he sat in the Continental Congress and won distinction by efficient service in military, financial, and diplomatic affairs. Horace Walpole, indeed, thought him responsible for the Revolution itself. The biography of such a man is an inseparable component of the history of his university and church and country. (John Witherspoon. By David Walker Woods, Jr., M.A. The Fleming H. Revell Company, New York. \$1.50, net.)

The Last Spike Cy Warman is well known as a writer of railroad stories, for which his early experiences as a railroad engineer had supplied him with abundant material. The tales in his new book are chiefly of the early days of railroading in the West; the one which gives its title to the volume is the romantic story of a young engineer engaged in the building of the first transcontinental road, the romance culminating with the driving of "the last spike." The stories are readable and entertaining, but they lack that something which, for want of a better name, is called "the literary touch." (The Last Spike and Other Railroad Stories. By Cy Warman. Charles Scribner's Sons, New York. \$1.25.)

A very convenient work in Museums and Ruins of Rome of which describes the mutwo small volumes, the first seums and the second the ruins of the Eternal City, by two well-known German scholars, who have revised the English edition. The plan of the work is very simple. Beginning with the Vatican, the student is taken through the Papal collections, the municipal collections, and the national collections, the text describing and characterizing the masterpieces, with sufficient biographical data relating to the sculptors, with succinct but clear accounts of the character of the work, and descriptions which enable the reader to fasten his attention on special characteristics, with a reinforcement of a profusion of illustrations. Each volume is prefaced by a short bibliography giving a list of books which treat of Rome and Romans, selected for the purpose of putting a beginner who means to be a serious student in the way of access to the best literature. (The Museums and Ruins of Rome. By Walter Amelung and Heinrich Holtzinger. In 2 vols. E. P. Dutton & Co., New York. \$3, net.)

Five short stories by Mrs. Spofford portraying the struggles for a livelihood made by Southern women in Washington after the war. The "Little Old Woman" is particularly pathetic, "A Colonel's Christmas" foreshadows better times, and true love triumphs over worldly advantages in "A Thanksgiving Breakfast." Humor, tenderness, and an intimate ac-

quaintance with the time characterize these tales. (Old Washington. By Harriet Prescott Spofford. Little, Brown & Co., Boston. \$1.50.)

Since the publication, a Philosophy of dozen years ago, of Otto Religion Pfleiderer's masterly work on this subject, no competitor with its fame has appeared till now, when the present work by the veteran Harald Höffding, of Copenhagen, seems likely to dispute with it for pre-eminence. He defines his task as "to elucidate the relation of religion to spiritual life," of which it is one among various forms. The real nature of religion is not to be found in its beginnings, whatever they may have been, but rather in its development, in which an unchanging principle is discovered operating throughout the continual change of religious forms. Such a principle appears in all popular religions, but especially in the higher types of religion, in "the conviction that no value perishes out of the world," and this is accordingly held to be "the core of religion." Religious need "consists in the desire to hold fast to the conservation of the highest values beyond the limits which experience exhibits and in spite of all the transformations which experience reveals." Thus our religious problem to-day is only a special form of "a great riddle" occurring also in other special spheres, and its axiom, or postulate, of the conservation of values, like the axiom of casuality, or the axiom of the persistence of energy, is only one form of the principle of the continuity of existence. Approaching the religious problem, first, in the intellectual line of epistemology, Professor Höffding, like Kant, finds it no thoroughfare. Turning thence through a line of psychological inquiry into religious experience, which shows the content of religious faith to be that "fidelity prevails throughout existence," he finds, like Kant, the ultimate criterion of the validity of this faith within the ethical sphere. "Ethics is concerned with the production of value:" it is in this sphere that the final balancing of the spiritual account must take place. It belongs to ethics to estimate different values comparatively. Ethically considered, the command is: "Make life, the life thou knowest, as valuable as possible." It is for religion to supply the motives of this pursuit of value. Everything called holy must be estimated by an ethical criterion. In the concept of the holiest religion and ethics ultimately meet. "That which is capable of the innermost appropriation by the individual, and at the same time is able to establish the deepest fellowship between individuals—that is the Holiest." To this

meager synopsis of a work of rare philosophical perspicacity and broad religious sympathy should be added Professor Höffding's remark that the special need of the present period of transition is the creation of "a new type of life," life based on the reality of ethical values with a psalm of confidence in their conservation. "The eternal is in the present, in every valuable moment, 'in each ray of sunshine,' in the striving which takes 'Excelsior' as its motto." (The Philosophy of Religion. By Dr. H. Höffding. Translated by B. E. Meyer. The Macmillan Company, New York. \$3.)

While the purpose of this book Silas Strong by Irving Bacheller is noble and worthy—a strong plea for the preservation of our forests-the actual story is not as impressive as it might be. The hero is somewhat too taciturn; his real character may not be an exaggeration, but its expression falls short of being lifelike. Another strange element is the wood-nymph who, entirely ignorant of life or even thought, captivates a young man who is a power in State politics, and becomes his wife. There is a very sweet tenderness whenever the two little children appear on the scene, relieved by the prickly honesty of their old aunt. The poetic justice of the coincident death of Silas and the "business" destruction of the forest is striking. (Silas Strong. By Irving Bacheller. Harper & Brothers, New York. \$1.50.)

The little village in the Pennsyl-Six Stars vania mountain valley here made the scene of a dozen or more admirable short stories is brimful of human nature, and Mr. Lloyd gets out of it a deal of honest fun and genuine character. There are some passages of serious feeling and indications of currents of passion, but in the main the tales are gently humorous, with a taste of dialect but without its abuse, and with a true perception of what is interesting and worth recording in the lives of simple people. These stories have pleased many as they have appeared in magazines, and they work together capitally in book form to make a clear and harmonious literary picture. (Six Stars. By Nelson Lloyd. Charles Scribner's Sons, New York. \$1.50.)

The Study of a Novel

In view the use of this book as a college text-book. It will, however, be found of positive interest to all students of literature. Structure, settings, plot, dramatis persona,

style, subject matter, æsthetic and influence are all, with other phases of fiction-building, analyzed and illustrated by pertinent examples. Sometimes, as is usual with such studies, the analysis is a little stiff and the desire to classify and group ingenious rather than useful, but there is a time to dissect as well as a time to enjoy, and in its own chosen field this book is exceedingly thorough and instructive. (The Study of a Novel. By Selden L. Whitcomb, A.M. D. C. Heath & Co., Boston. \$1.25.)

With this volume there Travel Lessons on belongs an ingenious the Life of Jesus contrivance for making the lessons realistic. A set of stereoscopic photographs of Palestine are so arranged that two or three views can be studied with each lesson. A simple stereoscope is supposed to be used by each class. We can easily imagine that in the hands of a wise teacher, who is willing to follow the sane and clear instructions which are given in an accompanying pamphlet, this simple outfit would be very serviceable. As Mr. Forbush says, this device not only secures attention by isolating a boy behind a hood and directing his sight to a picture interesting by reason of variety, but it also helps to make the scenes and characters which the boy studies real to him. The lessons themselves are well planned, sensible in their approach to difficult questions, human and concrete rather than bookish and abstract, and adapted to boys' and girls' minds. (Travel Lessons on the Life of Jesus. By William Byron Forbush. Underwood & Underwood, New York. 50c. With Stereoscope, 75c.)

This is the second in or-The Vicar der of Anthony Trollope's of Bullhampton Manor House series, although, like all his books, it can be read with perfect comprehension independently. It is pleasant to know that the publication in this country of new editions of the Barsetshire and the Parliamentary series has disclosed a very genuine interest in the fiction of this placid and unexciting but always readable novelist. In truthful portrayal of English society Trollope was supreme, and his novels always have a genuine hold on the attention and a certain element of upheld suspense in the plot which make needless any sensationalism. The men and women are wellbred English people of the kind with whom Trollope was in daily intimacy. (The Vicar of Bullhampton. By Anthony Trollope. In 2 vols. Dodd, Mead & Co., New York. \$2.50.)

This Razor must Pay for Itself before You Payme a Penny Without Charge.

—and a Postal gets it. I Guarantee to Keep your Blades Sharp Forever

24 Blades

I am the man you hold personally responsible for every promise made in this advertisement.

P. C. SHERMAN

WILL you let me send you a razor-without a cent deposit?
Then I will keep it sharp and keen for the rest of your

life free.
That's my plan-my new plan of selling razors.

No other razor makers in the world sell razors this way-because

the world sell razors this way-because they can't-their razors won't stand it. Mine will-it's the way it's made. Now, I don't say, "Send me the price of the razor, a.d if, after you have tried it, you find that it isn't all I claim, I will send your money back." Not me.

On a "money back" proposition you may feel that there was some chance of not getting your money of the world.

not getting your money back if you wanted it—I won't let you feel that way

about my razor.

For if the razor don't do all I say, you send it back at my expense, and you're out nothing, for you've paid me nothing and you owe me nothing. Simply do this—Send me

your name, occupation, home and business address—and in any manner that is

nome and business address—and in any manner that is convenient and agreeable to you introduce yourself to me. I'll take all the risk and send, prepaid, a Sterling Safety Razor with 24 blades, or an Old Style Interchangeable Razor with 12 blades.

You see the Sterling Razor is so much better than any other razor that I can afford to send one without any resyment or denotit.

payment or deposit.

When you have tested it 7 days, if you find it the finest and easiest shaving razor you ever used, keep it.

Then the razor must pay for itself—that's my new

You see the average man should be shaved at least three times a week—at 15c. a shave that's 45c. a week for

three times a week—at l.sc. a shave that's 45c. a week for shaving.

So, if you decide to keep the razor, all I ask you to pay me is what you'd pay the barber—45c. a week for a few weeks until the razor is paid for.

That way I make the barber buy you the razor.

At that my razor doesn't take any more money to pay for itself than you would have to pay out of your own pocket for an ordinary razor.

And I go even farther.

I see to it that your blades are kept sharp forever—free.

I see to it that your blades are kept sharp foreverfree.

With any other safety razor you are always paying out
money because you must keep on paying for new blades or
resharpening as long as you live.

But with the Sterling, all you do is, send me 12 dull
blades, at any time, with 10 cents to cover postage, and I
return them to you perfectly sharp, free of charge.

That's really "no honing and no stropping."

Did you ever hear of anything as clever as this in the
razor line?

It's this way—the reason I can make this offer is be-

It's this way-the reason I can make this offer is be-cause I'm not in the least doubtful or afraid of my

My STERLING blades are made of the finest razor steel that money can buy-costs me twice as much as the

steel used in any other razor blades.

And mine is the only razor on the market that is made of genuine Sheffield steel—that is not a cold rolled steel.

With my careful, systematic process, each STERLING blade is hardened, tempered, ground and honed in oil, all

by hand, and then hand stropped-so that my razor must

And each of my STERLING blades must pass the SHERMAN test, the most rigid test to which a razor blade can be subjected.

No other razor blade could pass this test.

But I must make certain that the temper and cutting edge of every STERLING blade is perfect and lasting. I cannot afford to pass any but faultless razor blades, because my razor is made to shave with, and not made to sale.

to sell.

And, because of all this, I can afford—and am glad—to send you the razor, prepaid, for free trial without any deposit but your name, address and the introduction. If you don't introduce yourself to me I will have to write you to do so, and that will delay shipment of the Sterling. You can buy the Sterling Razor for \$5.00, but I am willing to send it to you and let it pay for itself.

Now—write me to-day, stating whether you wish the Safety or Old Style Interchangeable, and let me send you the razor. State whether you wish to cut close or medium, and whether your beard is wiry or fine. Don't send me any money—only a postal.

Remember the razor is yours for a week free—then either keep it and let it pay for itself with the guarantee that I must keep the blades sharp forever—free—or return it to

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

It is pure!

That is the one thing about Ivory Soap that is of paramount importance.

It floats; it is economical; it is free from that unpleasant odor which many soaps have; it is available for use not only in the bath and toilet, but also for fine laundry purposes—these things are important, but, after all, they

are secondary to the one great fact that Ivory Soap is pure soap; and nothing else.

There is no "free" (uncombined) alkali in Ivory Soap. That is why it will not injure the finest fabric or the most delicate akin.

Ivory Soap—9941 Per Cent. Pure.

8

Shaken and partly de-San Francisco stroyed by earthquake, dein Ruins vastated by fire, with more than half its people homeless, encamped in the open air, and sorely in need of food and shelter, San Francisco appeals to the sympathy and the succor of The calamity is comparable America. only with those which laid waste Chicago, Charleston, and Galveston, and in some ways is more widespread than any that has ever afflicted any American city. Early in the morning of Wednesday of last week (5:15 is the exact time) an earthquake so powerful as to affect seismological instruments on the other side of the world shook part of the Pacific Coast. A second and lighter shock followed at eight o'clock. Not only San Francisco, but a score of smaller Californian places suffered. Santa Rosa, for instance, a charming town north of San Francisco, lost some forty or fifty lives, and the public and business buildings were wrecked; San José suffered even more severely, and, including the loss of life in Agnew's Insane Asylum near by, probably at least one hundred and fifty people perished there; at Palo Alto the fine and beautiful buildings of the Leland Stanford Junior University, including the great memorial church, were overthrown in whole or in part. These, with the lesser disasters in many places, would alone have startled the world, had they not been thrown into relative insignificance by the appalling scenes in San Francisco. Just what the loss of life there may have been is not yet accurately known. No doubt the first fearful guesses of many thousands were much exaggerated, but although the great business houses and public buildings had hardly any people in them at the early hour, there were countless tenement, lodging, and small private houses shaken down, and beneath them and from falling walls

in the streets where they had rushed for refuge, and in single disasters here and there, hundreds of men, women, and children perished or were maimed. One newspaper correspondent thus describes the effect of the shock: "Beginning with a slight tremor, it increased in violence every moment. Before it was over, the smaller and older buildings in the business districts had fallen like houses of cards, the great steel buildings were mainly skinned of walls, and the tenement district, south of Market, was in ruins. In the Western Addition and the hills, where live the wealthy and well-to-do people, few houses went down; but the shock was so great that people streamed out into the streets, where the ground was still quaking." The United States Government buildings fell, with the exception of the Mint, which was favorably situated, and the new Post-Office, which was seriously injured but not wholly destroyed; the City Hall, which cost \$7,000,000, lay in ruins; theaters, business blocks, department stores, hotels, banks, and churches were overthrown by scores. The famous Palace Hotel escaped the shock to fall later by fire. erally speaking, the few steel structures withstood the shock remarkably well, and architects draw the deduction that if a steel structure be properly anchored in rock foundations it is the best form of frame to resist seismic disturbance. even though the outer shell of stone or brick be shaken off. The damage by shock was greatest in the low, made lands which lie mainly to the southeast of Market Street and were occupied partly by the business section, partly by the poorer classes of dwellings, including "Chinatown," which was utterly destroyed. It is a difficult problem for insurance men to say what was ruined by shock and what by fire, but, as we

write, the impression seems to be that the first form of destruction was less sweeping than at first supposed.

Hardly had the ground At the Mercy of Fire

ceased to shake to and fro when a great number of fires blazed fiercely up in all parts of the ruined section. Joining together in centers of flame, soon eight large conflagrations could be counted. Water was not to be had from the broken mains. the wind blew west from the Bay, and the most heroic efforts of firemen and volunteers could not prevent a steady advance of the fire lines toward the northwest, where is the better residential section, and through the southern or Mission section, thickly tenanted by poor people. Dynamite was used freely, but with little effect, and on Thursday it seemed as if the entire city would go. But that night came a change of the wind, and the steady western trade-wind turned the fire back on itself, so that by Friday Mayor Schmitz could issue a proclamation declaring that the fire was under control, the danger passed, and a supply of water at hand; nevertheless, he pointed out the likelihood of other fires being started if citizens should use unsafe chimneys, and urged great caution. The turn in the direction of the fire endangered for a time the great ferry house at the foot of Market Street. While the section actually destroyed is not, geographically speaking, much more than a third of the city territory, it is the heart of San Francisco, including the chief business streets, immense districts inhabited by the poorer people, and a large part of the so-called Nob Hill quarter, where were the finest and costliest residences of the city. Another fine residence section, Pacific Heights, escaped, together with that known as the Western Addition. The unburned territory, although large in extent, was in the nature of suburbs and was not closely built up, so that estimates made as late as Saturday declared that three-quarters of San Francisco's improvements on real estate had been destroyed. The burned district is about two miles from east to west and from two to four miles from

north to south, with, of course, very irregular lines. The money loss by fire may be from two to three hundred million dollars, and it is feared that some of the fire insurance companies may be overwhelmed by their liabilities. What may be the uninsured and pitiful loss of personal property, especially by the poor and homeless families, is not capable of being reckoned in figures.

The Concentration Camps

More than 200,000 people, it is said, slept on Thursday

and Friday nights in the great camps established in Golden Gate Park, in the Presidio, and at Fort Mason, tens of thousands crossed the ferries and sought refuge in Oakland, Berkeley, and Alameda, while other thousands camped in the small parks, public buildings, and the open field. Suffering was serious and widespread despite the mild and clear weather. Water was scarce and its distribution difficult; food was at first hard to come at, and there seemed danger that it might temporarily give All accounts agree, out altogether. however, that the people as a whole were patient, resourceful, and mutually helpful. Attempts at plunder and extortion were promptly met and sternly punished. General Funston, commanding the United States troops, lent the municipal authorities invaluable aid in preserving order, picketing the lines and aiding the refugees. Citizens' committees were active in every direction. Soldiers, police, and firemen toiled incessantly and efficiently. A few miscreants were shot; some provision dealers who tried to charge a dollar for a loaf of bread were arbitrarily forced to desist. The dead were buried in trenches here and there by the older men workers. The injured and feeble were protected and helped to hospitals. Tents were erected by hundreds in the camps. Everywhere were seen picturesque as well as pathetic and heartrending incidents, and everywhere was a disposition to make the best of things. The greatest danger now is from sanitary conditions, which are necessarily bad in the beginning but are rapidly being improved.

Relief at Hand The moment the situation became understood the Nation rushed to the aid of the stricken people of San Francisco. Congress appropriated first a million dollars for relief, and later added a second million. Secretary Taft devoted his whole time to setting in motion the War Department's machinery to hurry from every available point tents, provisions, and, if needed, soldiers. Chambers of Commerce and other public agencies subscribed and gathered vast amounts. Individuals contributed sums ranging from the \$100,000 each of Andrew Carnegie and W. W. Astor to the dollar of the workingman. By Saturday it was estimated that at least ten millions had been subscribed, and from every quarter supplies were hastening by the train-load to San Francisco. President Roosevelt recommended that "the outpouring of the Nation's aid should, as far as possible, be intrusted to the American Red Cross, the National organization best fitted to undertake such relief work." Of this National society Secretary Taft is President, and it is now so organized that it can easily and naturally co-operate with those instruments of the Federal, State, and municipal governments which will be employed in alleviating distress. Many of the States have well-organized branches. It is most fortunate that of these the California branch is among those best established. For money contributed through this channel there will be a public accounting, and contributions intrusted to the Red Cross will have the greater value because they will be utilized in conjunction with the public authorities. For this reason The Outlook advises its readers to make their contributions for the relief of San Francisco, and of other places injured by the earthquake, through the Red Cross Society. Money may be sent either to the State treasurers or to the National treas-The largest State branch is that of New York, and its Treasurer is Jacob H. Schiff, Room 309, 300 Fifth Avenue. The Treasurer of the American National Red Cross is Charles Hallam Keep, Washington, D. C. Dr. Edward T. Devine, Secretary of the New York City Charity Organization Society and Professor of Sociology in Columbia Univer-

sity, has been chosen to assume control of all Red Cross relief work in the State of California. It is certain that support from outside will be needed for an indefinite period. Too much praise cannot be given to the military and municipal authorities in San Francisco for the work already done, but they must have National support and organized relief. That San Francisco will be rebuilt is already an assured fact, and that it will so be rebuilt and so supplied with water as to render impossible, even in case of earthquake, the devastation of last week is confidently predicted.

•

The President's Criticism of the Judiciary When Judge Humphrey, of the United States District Court of Chicago, decided

that the beef-packers under criminal indictment were immune, by virtue of the information which they had given to the Bureau of Corporations, it was clear that some change in the law would have to be made unless Judge Humphrey's decision were reversed. It is evident that Congress never intended to make one law for the control of corporations interfere with the operations under another law designed also to control corporations; and yet that was the practical effect of the decision. The President has, consequently, sent a special message to Congress recommending that Congress pass "a declaratory act stating its real intention." The President points out the necessity also of allowing the Government "the same right of appeal in criminal cases, on questions of law, which the defendant now has, in all cases where the defendant has not been put in jeopardy by a trial upon the merits of the charge made against him." He, moreover, urges the desirability of enacting a law "declaring the true construction of the existing legislation so far as it affects immunity." In commenting on this he justly adds:

Our system of criminal jurisprudence has descended to us from a period when the danger was lest the accused should not have his rights adequately preserved, and it is admirably framed to meet this danger. But at present the danger is just the reverse; that is, the danger nowadays is, not that innocent

men will be convicted of crime, but that the guilty man will go scot free. This is especially the case where the crime is one of greed and cunning, perpetrated by a man of wealth in the course of those business operations where the code of conductis at variance, not merely with the code of humanity and morality, but with the code as established in the law of the land.

With this The Outlook heartily agrees. The same principle was laid down by Secretary Taft in his speech at Yale Law School last summer. But when the President goes on to speak in criticism of Judge Humphrey's decision, he employs phraseology which one would hardly like to see even in newspaper comment. He says that "the result has been a miscarriage of justice," that he can "hardly believe that the ruling of Judge Humphrey will be followed by other judges," and that "such interpretation of the law comes measurably near making the law a farce." This language of the President is hardly in accordance with the principle on which he acted when, in reply to the labor leaders headed by Mr. Gompers, he delivered a rebuke to them for submitting to him a criticism of a co-ordinate branch of the Government. In that case it was Congress whose dignity the President regarded. The judiciary is also a co-ordinate branch of the Government with the executive. Its position is such that its power and usefulness are in great measure dependent upon the respect which the people pay to it. There is no occasion for making of the courts a fetish; but the American people are not so lawabiding that it is wholesome for any public man so to speak of the judiciary as to lower popular respect for the courts.

€

The Outlook expressed Comment on the its own views of the ' Muck-Rake'' President's address on Speech the "Man with the Muck-Rake," together with a reprint of the speech itself, last week. Those newspapers which made their criticisms of the address before it was delivered discovered after its delivery that they had to do their work over again. Much to their surprise, they found that the noteworthy thing about this speech was not, after all, a criticism of critics, but a proposition for an amelioration of conditions out of which the "muck-rakers" had made capital. The Cincinnati "Post" is one of the few newspapers which thought it worth while to debate at length the President's protest against hysteria. It considers that protest untimely in view of the fact that "our fault as a people is not in too much complaint, but in too easy tolerance of wrongs.' The passage in the President's speech which has aroused discussion all over this country, and even evoked comment from the British press, is that in which he recommends a tax upon fortunes transmitted by gift or inheritance. This discussion has revealed many points of view, and has been participated in by some journalists who seem to have no point of view whatever. One of the most unintentionally amusing comments has been made by the "News and Courier," of Charleston, South Carolina. This paper says, with calm indifference to the meaning of words, that the President's suggestion "is Socialism in one of its most radical manifestations, and it indicates a policy which will meet with high favor by the reactionary element in both the old-line political parties." thus expressing its surprise at such a "radical" and "reactionary" proposition, it announces with entire equanimity a suggestion made "by a thoughtful student of social and political problems in this town," namely, Charleston, that "enormous fortunes . . . shall revert in large part to the State upon the death of their owners." Some newspapers urge that the taxation or confiscation of fortunes should be made, not by the Federal Government, but by the State. this the Milwaukee "Free Press" says:

There is manifest justice in the idea of this tax being imposed by the National Government—the proceeds going into the National Treasury. Most of the fortunes of unhealthy limits as to size are sapped up from the country at large, rather than from one small portion of it—as a State. There would be no justice in the State of New Jersey, or New York, getting all of the Rockefeller wealth except a million or two that might be allowed to pass on to the billionaire's children.

Volatile as the American people often are in matters which appeal to the sentiments and the emotions, they are conservative in matters of thought and opin-

ion. In respect to this proposition of the President's, this conservative trait has been tersely expressed by a Southern newspaper, the "Ledger," of Birmingham, Alabama, in these two sentences:

The American idea has been to allow a man to make all he can. That is so clearly a man's right that nobody except the Socialists object to it.

And the New York "Times" is so confident that the present industrial system and order are of divine origin that it ventures to think that

Upon more mature reflection the President may conclude that it is not wise to undertake to interfere, by Governmental operations, with the natural course of our evolution. He may even come to be impressed with the wisdom of the familiar line:

I sometimes think that it were best to leave the Lord alone.

This conservative opinion, or at least the tendency to be cautious in formulating views about matters that have not been framed in conventional party pronouncements, has been evinced in the disinclination of many public men to express their opinion upon the proposition to put limits upon fortunes. Senator Clark, of Montana, who is reputed to be the richest man in the Senate, expressed the opinion, as reported in the press, that there was "no warrant for this unrest and agitation." On the other hand, Professor Franklin H. Giddings, of Columbia University, who is everywhere recognized as an authority on social science, is reported to have said that Mr. Roosevelt has exercised great political foresight in forestalling a bitter class struggle between the power of great wealth and the power of a workingman's socialism by formulating plans designed to maintain the present social organism by limiting it in the interest of the whole public. Strange to say, very little comment has been called forth by the apparently more immediately practicable proposition of the President for the Federal licensing of corporations doing an inter-State business.

æ

Operators Reject Miners'
Compromise Offer
The representatives of the anthracite-car-

rying railroad companies on April 16 rejected the final compromise offer of

the representatives of the hard-coal mine employees to the effect that the differences between them preventing a resumption of mining operations be submitted for arbitration to the Anthracite Coal Strike Commission. The formal reply of the operators closes with the statement that "we have no suggestions to make other than those contained in our former proposition," which were to the effect that only questions concerning wages and the adjustment of complaints be submitted for arbitration to at least a majority of the Strike Commission, a proposition that had previously been rejected by the representatives of the mine employees. The reply of the operators states that "the fundamental principles regarding the conduct of this business have all been established by the Strike Commission," and insists that no reason has been suggested why they should be retried. The next important steps bearing upon the situation will be the submission to a special convention of anthracite employees of a report of the negotiations which have been carried on with the operators since December last, and the action this convention will take in the matter. It is possible that the convention will accept the report of the committee, and then by resolution agree to a continuance of the arrangements and conditions of employment laid down by the Anthracite Coal Strike Commission's award. The alternative is the formal declaration of a strike to take the place of the present suspension. Strike conditions already prevail among the mining population of the three hardcoal fields. Marriages have been postponed, thousands of mine workers have left the region to secure employment elsewhere or have returned to their homes in southeastern Europe, family expenditures have been checked, business houses have laid off employees, the crews of coal trains and many yard employees have been thrown out of employment, and a general state of idleness prevails in all the mining Such conditions, although in towns. less accentuated forms, would have prevailed during the summer, however, even if there had been no formal suspension of coal-mining at this time, owing to the

over-supply of coal held by the railroad mining companies. It is estimated that nearly nine million tons of coal are in the different storage yards, and until this had been largely disposed of the mines would have been worked on half-time only, with corresponding idleness for the employees. The important developments in the bituminous mine labor situation the past week are the return of more workers to the mines in different States in consequence of the signing of the 1903 mining scale by other operators, and the rejection by the mine workers' officials of the offer of arbitration by the operators who refused to sign the 1903 scale. offer was referred to in The Outlook of April 21. The reasons given for its rejection by the National Executive Board of the United Mine Workers of America are its limitations in scope and the resulting unfairness of arbitration to those operators who have granted the compromise wage increase. An important announcement relating to the coal situation was made last week. United States Government has employed Mr. Charles E. Hughes, who conducted the insurance examination in New York, as special counsel to examine alleged violations of the Inter-State Commerce Law by the coal-carrying railway companies.

An Avalanche of

Immigrants

On one day last week over eighteen thousand immigrants were await-

ing examination in New York harbor. Large and well equipped as is the immigration office on Ellis Island, efficient and well organized as is the force of inspectors, such numbers are overwhelming. Five thousand a day are about all that can be adequately examined; that means that the equivalent of a good-sized village has to be so closely uspected that no pauper, no insane person or idiot, no case of contagious or loathsome disease, shall be allowed to pass. Of this community, in other words, a census has to be taken, and the physical condition of each of its members has to be diagnosed. Even the normal number of immigrants taxes the ability of the inspectors to the utmost. It requires a high degree of alertness, skill, trained judg-

ment, experience, and common sense to pick out from a steadily moving file of foreigners those who are not legally admissible. When, therefore, there is such human congestion as that which has existed at Ellis Island these past few days. the conditions are serious. By Saturday, 45,000 immigrants, it is estimated, had reached the port of New York during the week. Of course there has been nothing to do but to keep shipload after shipload waiting unlanded. In the meantime other crowded vessels have been arriving, each of them black with people—floating hives covered with human Enough foreigners arrived in New York harbor last week to populate a city a fifth larger than Tacoma, Washington. Is it conceivable that such a host, one-half again as large as the greatest number heretofore arriving in the same interval and greater than the total number of immigrants for any year prior to 1832, can be properly scrutinized in any one place within the space of a week? Is it not clear that inspection ought to be made in the various ports of embarkation rather than concentrated in one place on this side of the Atlantic? There is now pending in both houses of Congress a bill placing further restrictions upon immigration. It seems imperative that some legislative action be taken. Even arbitrary restrictions, although they might do nothing more than limit the number without affecting the quality of immigrants, appear now to be preferable to a continuation of present conditions.

The New York Legisla-The Insurance ture acted last week on Legislation all of the insurance bills introduced by the Armstrong Committee, sending them to the Governor in practically the form into which they had been finally put by the Committee. An attack which promised for a time to be successful was made in the Senate on one of the most important parts of the main An amendment was introduced by Senator Horace White, of Syracuse, eliminating the provision requiring mutual companies to make public the lists of their policy-holders previous, to an elec-

tion. The amendment was forced through the Senate against the protest of Senator Armstrong that it would fatally weaken the whole plan of the insurance legislation and would make it impossible for the policy-holders of the New York Life and the Mutual to exert any influence against the old management at the coming election. An immediate outburst of public disapproval throughout the State and the prompt and energetic action of Governor Higgins secured a reconsideration and the rejection of the amendment the next day. The bill was then passed without further amendment. This completes the work of the Armstrong Committee, crowning it with the success which the faithful, unselfish, and tireless labors of its members so richly deserve. In contrast to the excellent record of the Legislature in the insurance legislation is its action in regard to the tax on the surplus of savings banks. Both the Republican party and Governor Higgins personally had pledged themselves to the repeal of this tax; but, in spite of this pledge, the bill providing for its repeal was defeated in the Senate last week. It is reported that the bill was killed for political reasons in an attempt to embarrass the Senator who introduced The failure to carry out its expressed pledge, for purposes of factional revenge, reflects the greatest discredit on the Republican party in the New York Legislature.

(8)

The two hundredth anni-The Franklin versary of the birth of Celebration Franklin was observed in Philadelphia last week by a series of deeply interesting meetings. It is not often that a great public man is so closely identified with a locality as was Franklin with Philadelphia-his home for many years, and the place in which he worked out many of his experiments, both scientific and practical. There was a large representation of foreign scientists, among them Sir George Howard Darwin, who presented to the American Philosophical Society, in the very building in which Franklin formerly presided over its sessions, a medallion of Franklin, which he put into the hands of the

presiding officer, Professor W. B. Scott, of Princeton, a great-great-grandson of Franklin, and a medallion of Erasmus Darwin, one of Sir George's great-grand-Professor Hugo de Vries, of Amsterdam, Professor Pickering, of Harvard, Professor Knight, of London, Professors Nichol, of Cornell, Chamberlin, of Chicago University, Royce, of Cambridge, and Rutherford, of Montreal, contributed to the discussion of the different sides of Franklin's wonderfully fruitful career. The most picturesque feature of the celebration came at the close of the opening exercises in Witherspoon Hall when Mr. Carnegie, wearing a brilliant scarlet robe as Lord Rector of the University of St., Andrews, conferred upon Miss Agnes Irwin, Dean of Radcliffe College, and a granddaughter of Franklin, the degree of LL.D. from the same Scotch university which in 1759 conferfed that degree on Franklin. Miss Irwin is the fourth woman whom the University of St. Andrews has honored with this degree. The presentation of a degree by a venerable foreign university to the great-granddaughter of Franklin was the most picturesque incident, but the presentation of the Franklin medal to the Republic of France, in accordance with the act of Congress, was perhaps the most significant. The ceremonies were held in the Academy of Music, and the presentation was made by Mr. Root, Secretary of State, to M. Jusserand, French Ambassador. Previous to the presentation, addresses in commemoration of Franklin were made by Dr. Horace Howard Furness, President Eliot, and Mr. Choate. Dr. Furness's interpretation of Franklin's character was especially intelligent and happy. said, among other things:

No more auspicious star twinkles for us in the firmament than that which shone on the birth of Franklin. Under it he was endowed with an unappeasable hunger for knowledge; with a temperament so equable that the sight of injustice could alone disturb its poise; with a wisdom so comprehensive that no experience of life, however humble, failed to enlarge it; with a sagacity so sure that it partook of a prophet's fire; with an honesty so ingrained that in his "Autobiography" he would endure disgrace rather than seem to be what he was not; with a sense of humor so keen that it kept him from

yielding to the obtrusive vagaries of overwrought enthusiasm.

President Eliot, on the other hand, dealt chiefly with Franklin's attitude toward public affairs:

Franklin's political philosophy may all be summed up in seven words—first freedom, then public happiness and comfort. spirit of liberty was born in him. He resented his brother's blows when he was an apprentice, and escaped from them. As a mere boy he refused to attend church on Sundays, in accordance with the custom of his family and his town, and devoted his Sundays to reading and study. In practicing his trade he claimed and diligently sought complete freedom. In public and private business alike he tried to induce people to take any action desired by them by presenting to them a motive they could understand and feel-a motive which acted on their own wills and excited their hopes. This is the only method possible under a régime of liberty.

1

Mr. John Burns, the English Civil List labor leader, once contended **Parsimony** that no man's work is worth more than twenty-five hundred dollars a year; he has had to take considerable bantering, however, since he has accepted a Cabinet office which pays ten thousand dollars a year. The fact is, as President Eliot said in his recent address at Chicago, the day-laborer—Mr. Burns was that once-will never believe that any man can fairly earn a great salary. No ironbound rule, indeed, can be laid down in the matter. As regards our Government servants, however, we do not gauge their salaries by the accumulated amount of wealth represented in the business managed—but we should gauge them by a reasonable estimate of the inherent worth of human service. The President of the United States is obliged to be satisfied with a smaller salary than that paid to the heads of some minor European countries; yet what man fills an office of greater responsibility? In a recent article in the "NorthAmerican Review" ex-Postmaster-General James declared that President Monroe, on retiring from the Presidency, was compelled to sell his library for want of money and go to work in order actually to exist, and that President Benjamin Harrison was obliged after his term of office to take up his profession again in order properly to provide for his family,

saving more in the year following his retirement from the Presidency than he had been able to save in the four years of his incumbency; that William Windom, Secretary of the Treasury, was compelled to enter active business after he had retired from President Garfield's Cabinet; that Windom's successor, Governor Foster, administered the secretaryship when his private affairs were really on the verge of bankruptcy, yet, knowing what the Government straits were soon to be with regard to gold, he could have profited by that knowledge had he been so disposed; that Mr. Carlisle came to New York, after four years' service as Secretary of the Treasury, absolutely dependent on the practice of his profes-As Mr. James pointed out, Mr. Wilson, Secretary of Agriculture, showed the other day that the value of the agricultural products of the United States for 1905 considerably exceeded six thousand million dollars, and also showed with what great rapidity the value of the farms themselves is increasing. Notwithstanding this augmented wealth, and notwithstanding the higher cost of living, there has been no increase, in a general way, of the salaries of our public officials.

@

Progressive as Amer-The Workman is icans have been in Worthy of His Hire most directions, we are among the backward nations in compensating our high public officers. In the business and professional worlds Americans receive far higher salaries than men of corresponding positions in other countries, but our great Government officials, the men upon whom the prosperity of the country vitally depends, are paid low salaries compared with officials of like responsibility in any other country. We are glad that public attention has now been drawn to this subject by Congressmen themselves. sentative Longworth, of Ohio, in a recent speech pointed out the fact that the salaries of the President, Vice-President, Supreme Court Justices, Cabinet Ministers, and Ambassadors are very much smaller than our Government can easily afford and should pay; for instance, the salary of the

Auditor of the Panama Canal is ten thousand dollars a year, while his chief, the Secretary of War, receives eight thousand dollars. Nor are the salaries of Senators and Representatives adequate for a proper performance of the duties which they owe to their constituents and their country. In this spirit Representative Longworth recently introduced a bill practically to increase the salaries of our diplomats abroad by providing permanent embassies and legations; and as to our home officials, Representative Loudenslager, of New Jersey, presented a bill to increase the salaries of the heads of Executive Departments to fifteen thousand dollars a year each, and the salary of the Vice-President of the United States to twenty-five thousand dollars a year; we wish that he had also included a doubling of the President's salary.

To Helen Keller's appeal Helen Keller's for the blind, printed Appeal in another place in this issue, we add our indorsement rather for our own sake than for hers. The Outlook wishes to be counted with her. The first duty which every man owes to society is to be self-supporting; the most fundamental charity is help to the willing to become self-supporting. the blind can be made self-supporting, that they are eager to become self-supporting, and that they cannot become self-supporting without aid from the seeing, Helen Keller abundantly demonstrates. In the two States of New York and Massachusetts associations have been formed, first, to give such aid, and, second, by so doing on a moderate scale, to inspire the State to take up the work and carry it on upon a larger The immediate requests of these associations are very moderate. New York's asks for the current year \$15,000. It has, we believe, no paid officers. immediate needs of the Massachusetts organization we are not able to state, but they are not large. When the possibility of rendering the blind independent and self-supporting has been established beyond all question, we may reasonably hope that the States will

undertake the work of providing industrial education and industrial opportunities for them—but not before. Meanwhile, those who wish to be counted among the pioneers can send their contributions, or their inquiries for fuller information, for the Massachusetts Association, to Mr. Charles F. F. Campbell, 393A Broadway, Cambridge, Massachusetts; for the New York Association, to Mr. Herbert S. Barnes, 35 Wall Street, the treasurer, or to Miss Winifred Holt, 44 East Seventy-eighth Street, the secretary. Such contributions will be applied effectively to help the blind to support themselves.

�

Daniel Huntington, Daniel Huntington who died at his home in New York City on Wednesday of last week, was probably the oldest artist of rank in the country, and had long been one of the best known. His career may be said to cover the whole history of American art after the close of the period of Copley, Stuart, and Allston. point of age he was the leader of the older school of American painters, and for many years any kind of memorial painting for municipalities or organized bodies was apt to go his way by a kind of predestination, as in Holland it went to Frans Hals or Rembrandt. He had distinguished New England ancestry, was educated in the good old-fashioned way in an academy in the days when academies were places of liberal education. He had the great good fortune to be prepared for college by Dr. Horace Bushnell, and began formal college work at Hamilton. His love of art, however. and his predestination to use the brush as an instrument of expression, interrupted his college course. Fortunate friendships confirmed his taste, and at a very early age he left college and began painting portraits. He studied, meanwhile, under Inman and Professor Samuel F. B. Morse, who at that time was Professor of the Literature of the Arts of Design in the University of the City of New York, and a professional painter. As far back as 1835 Mr. Huntington painted two pictures—"The Bar-room Politician" and "The Toper Asleep" which attracted wide attention and gave

him some reputation. A year later he was painting in the highlands of the Hudson, in the neighborhood of Rondout Creek, and demonstrating his right to be a leader of what has since been called the Hudson River School. Four vears later he went abroad, studied in Rome, Florence, and Paris, and painted a number of pictures which were widely discussed. After a brief residence in his own country he went back to Europe on account of failing eyesight, and lived for two years in Florence. On his return to New York in 1845 he gave the emphasis of his efforts to portraiture. The list of prominent men in England and the United States who sat for him is a long and distinguished one, and his brush has preserved the features of many of the best-known women of New York and Washington. He became an academician in 1840, was elected president in 1862, and held that position until 1891, when he resigned. A contemporary critic said of him that few of our painters "have exhibited greater versatility of talent or more broad and pure artistic sympathies. ... He has delineated scenery and executed genre pictures with eminent success, so that his artist life is singularly representative and suggestive." The large picture, crowded with figures, sometimes known as "The Republican Court," but which the artist called "Mrs. Washington's Reception," contains between sixty five and seventy portraits of men and women, and was painted with the most painstaking fidelity, the artist having sought out and studied all accessible material in the way of portraiture. He is said to have painted more than a thousand portraits and at least two hundred other pictures, his portraits being distinguished by simplicity, dignity, and richness of coloring, and his landscapes by sincere feeling for nature and by admirable technical skill. Mr. Huntington was associated with the best things in the life of New York and of the country. He was one of the founders of the Century Association, and its president from 1879 until 1895. His long life was stainless, his devotion to his profession tireless and enthusiastic, his capacity for friendship notable, and his kindness tireless.

The Glory of San Francisco

Above the awful ruins of San Francisco, above the pall of dust and smoke which overhangs it, is a splendor which will remain long after the ruins and the cloud have disappeared, and no one can understand the true meaning of this tragedy who fails to see this splendor that of brave, true men and women. These, not buildings of steel and brick and stone, constitute the glory of a city, and these are not ruined. Never did they shine more luminous than in the awful days which have just passed. Above the crash of falling buildings, the explosions of dynamite, the cries of the wounded and the dying, one might hear, voiced not in words but in splendid deeds, the chant:

"We will not fear though the earth be removed,

And though the mountains be carried into the midst of the sea;

Though the waters thereof roar and be troubled,

Though the mountains shake with the swelling thereof."

We build our cities with strong and noble architecture, we call on all our knowledge and skill to create material symbols of our wealth that shall be able to defy the forces of nature, and a cyclone blows upon them and they are carried away by its breath like a child's house of cards, or the fire creeps stealthily upon them and they burn like shavings in the furnace, or the volcano opens its mouth and laps them up with its fiery tongue, or the earth shakes them and they fall upon the ground as though smitten with hopeless terror. And cyclone, fire, volcano, and earthquake repeat the lesson we are so slow to learn, that the material is not the real, not the permanent. Its strength is fragility, its endurance transient.

But, at the same time, indomitable courage, unshaken patience, exhaustless charity, find in the disaster their opportunity; in the tragedy their glory. They also repeat to us a lesson—that the immaterial is the real, the spiritual is the indestructible. The real tragedy is the collapse of a human soul, and, thank

God, what the disaster at San Francisco reveals is the soul of a great people unshaken by earthquake, unsinged by fire.

In that hour the hearts of men were revealed, because the conventions of society were loosened, and the people were thrown back upon their instincts and their impulses for guidance. Doubtless there were shameful scenes of panic and of sordid selfishness, but there were also resplendent deeds of unselfish devotion, and it was this spirit of devotion that was dominant. The citizens making their brave fight against the devouring flames after the water supply was exhausted and courage was no longer reenforced by hope, the conversion of the food supplies of the city into a common stock to be shared by the hungry as necessity might dictate, the invitation to the homeless to find shelter in the houses that remained, the offer of free carriage across the bay by the railway company to the fleeing throngs, the inrush of physicians from the surrounding country to tend the wounded and the dying without charge, the volunteer burial service for rich and poor in a common grave, the Catholic priest putting up his altar and conducting service in the open air that reverence and faith might not be without a witness, the Mayor reflecting the purpose of the people in his public message to the Nation that a new San Francisco will be rebuilt upon the ruins of the old, the quick response of the whole country, by Congress and by unnumbered thousands of individual givers, offering their aid before a call had been made for succor these and kindred incidents stand out to show that San Francisco is not destroyed nor America injured. For no city is destroyed while her people remain brave and true, and no country is injured while her people are united in the faith that the injury of one is an opportunity for service to his uninjured neighbor.

"The removing of those things that are shaken, as of things that are made," says the sacred writer, "signifieth that those things which cannot be shaken may remain." The Outlook makes here no attempt to explain the ways of God. We essay a humbler task: to point out a lesson that may be learned from the earthquake and the fire—the

lesson that the glory of America lies, not in her material things, but in her spirit. The material things may at any time crumble to dust or be consumed to ashes; but if so, the only effect is to give her heart of courage and of charity a new opportunity for exercise. And it is this spirit which alone makes either an individual or a nation great.

The Divorce Decision

The Supreme Court of the United States has rendered a decision which it is reasonable to believe will have the effect of putting an end to fraudulent divorces.

The Constitution of the United States provides that full faith and credit shall be given in each State to the judicial proceedings of every other State; but, in order that such credit shall be given, the court whose judicial proceedings are in question must have jurisdiction of the case and of the parties involved. is necessary to give a State court jurisdiction of the parties is a question which has often been before the Supreme Court of the United States. It has decided that if a court grants divorce in accordance with the laws of a State, that divorce is binding on the parties and properties within the State, although the defendant may never have had notice of the divorce proceedings; that if both the parties appear in the case, this appearance gives the court jurisdiction; that if the husband and wife have lived in the State and the wife has left her husband and moved into another State, the courts of the State from which she has moved have jurisdiction and the divorce decreed by them is valid although she has not been personally served with its process. But it has now decided that if a husband and wife have had no residence within the State. and one of them, say the husband, has obtained residence in it, having previously separated from his wife, the decree of divorce granted by such State has no legal effect beyond the boundaries of that State unless the wife has been personally served with process or otherwise brought within the State's jurisdiction. We cannot better indicate the

effect of this decision than by quoting from the opinion of Judge White his statement of the effect which would be produced by the opposite opinion that a State may grant a legal divorce to a man residing in that State though his wife has never resided in it and has never been personally served with the summons:

Under the rule contended for [and condemned by the Supreme Court] it would follow that the States whose laws were the most lax as to length of residence required for domicile, as to causes for divorce and to speed of procedure concerning divorce, would in effect dominate all the other States. In other words, any person who was married in one State and who wished to violate the marital obligations would be able, by following the lines of least resistance, to go into the State whose laws were the most lax, and there avail of them for the purpose of the severance of the marriage tie and the destruction of the rights of the other party to the marriage contract, to the overthrow of the laws and public policy of the other States. Thus the argument comes necessarily to this, that to preserve the lawful authority of all the States over marriage it is essential to decide that all the States have such authority only at the sufferance of the other States.

Grouping these decisions of the Supreme Court, the results may be thus briefly stated: If a State wishes to go back to the pagan-Roman conception of marriage as a partnership which can be dissolved at the pleasure of either party, it is at liberty to do so, and divorces granted by that State will be legal within the boundaries of the State. If a husband and wife living in another State wish to adopt the pagan-partnership conception of marriage, they can move to such pagan State and get the divorce and it will be legal. But if the husband alone wishes to turn pagan and moves to the State where marriage is regarded as a dissolvable partnership, he cannot compel his wife to accept his new conception of the marriage relation, and any divorce which he may obtain within the State to which he has moved will have no force or effect outside of its boundaries.

It is thought by some of the newspapers that the effect of this decision will be to add impetus to the movement for uniform divorce laws. We think that it will have the opposite effect. The chief complaint against the present working of divorce laws in America, by those who

believe that marriage is something more than a commercial partnership, dissolvable at the pleasure of either party, has been that the States whose divorce laws are most lax have been able to impose those laws on all the other States. will no longer be possible. We shall continue to have some States which believe that husband and wife should live together until death do them part, and others which believe that every marital tiff or uncongeniality of temper should lead to a separation and a new experiment. But the people of one State will not have their marriage laws invalidated by the decrees of another State. They will have therefore no longer the same reason that they have had in the past for desiring some amendment of the Constitution limiting the power of those who hold the pagan conception of marriage to impose it upon those who hold the Christian conception of marriage. Any uniform divorce law would be necessarily a compromise between these two conceptions. It is at least questionable whether the injury to the family would not be greater than the benefit.

It may be reasonably hoped that this decision of the Supreme Court will effectually put an end, not indeed to all divorces on inadequate grounds, but to all fraudulent and grossly unjust divorces.

Public Responsibility for Mob Violence

Two months ago a crowd of men and boys in Springfield, Ohio, inflamed by the murderous deeds of two negroes, terrorized a sordid negro quarter of the city, demolished buildings, and set the forces of order at defiance. A number of young men and boys were arrested. Some were acquitted; others were fined one dollar apiece and costs, and their fine remitted. The Outlook, having characterized this proceeding as a travesty on justice, has received from Springfield the following letter:

To the Editors of The Outlook:

As one of the jurors drawn to sit upon the case of the alleged rioters arrested in this city a few weeks ago, and at the request of

other jurors and many prominent citizens of Springfield, I wish to say, briefly: The real rioters in the Springfield outbreak were never before this jury. Thirteen young men and boys were arraigned. Five were acquitted and eight technically convicted. The difference in the jury's verdict was based on this distinction: Those not shown to have started with or followed the mob crowd were re-leased. Those who, in the prevailing excitement, or through motives of youthful curiosity, kept with the crowd, but who committed no act of destruction or violence, were convicted under the first clause of a very severe indictment, namely, of "being found in an unlawful assembly." Not one, even of the latter, was proven to have done a single morally culpable act during the night of the riot. Propriety and public opinion, however, seemed to require a distinction to be made

in the verdict.

The police court officials, fire marshals, and the military authorities would have gladly given out to the world that in the person of these thirteen unoffending youths the real rioters, hose-cutters, and house-burners had been captured and punished. The fact is, the sharks and dog-fish got away, as they usually do, and the minnows were ensnared in the net. Those arrested spent from one to six nights in jail, according as they were or were not able to furnish bail. I repeat, not one of the actual rioters was

tried before this jury.

1906

The Outlook, in its issue of April 7, said: "If there could be any surer method of bringing ridicule upon criminal proceedings, it is apparently unknown in Springfield, Ohio." There could be, however, a "surer method of bringing ridicule upon criminal proceedings." It would be to punish the innocent because the guilty had escaped, and to allow public assumption, or the oratory of an eloquent police prosecutor, to usurp the place which in such a trial can justly be given only to the evidence.

CHARLES S. KAY.

Springfield, Ohio.

Either these boys were guilty of rioting or they were not. If they were guilty, the community could not release them from punishment without sharing in their crime and abetting them in lawlessness. If they were not guilty, the community was inexcusably at fault both in attempting formally to put some of the stigma upon them, and in failing to secure the real offenders. No explanation can change the fact that Springfield, Ohio, has twice suffered a mob to destroy property and menace the safety of citizens, and has twice allowed the mob to go unpunished. That community is in a sorry state of intellectual and moral confusion which

first permits within its borders a vicious quarter to flourish, and then acquiesces in attacks on that quarter by an irresponsible mob. No one community, however, is sinner above all others. As The Outlook said two years ago when the first of the two mobs held sway in Springfield, Ohio, "There are unnumbered communities in the United States. outwardly peaceable to-day, which are in fact as lawless as was Springfield" during the mob rule. And now another of these communities has revealed its law-Springfield, Missouri, has follessness. lowed the example of its Northern namesake, and has permitted a mob to seize and lynch negroes awaiting trial; and citizens of the place have shown a readiness to render judgment without waiting for the due process of law. Wherever, in fact, the community allows lawbreaking to continue unmolested so long as it is not scandalously open and too troublesome, it abdicates its throne as sovereign; it must, therefore, not be surprised if, when the mob seizes its throne, rudely does the work which the community ought to have done in an orderly fashion, and for a time rules in its stead, it loses its repute as a civilized community.

There is a sound foundation for the American public sentiment which holds a community morally responsible for the deeds of violence perpetrated within its borders. We are informed that the State of Ohio has by statute relieved its counties and cities from legal responsibility to property-owners for damage_done by mobs. If this is so, that State has denied to its citizens and residents one of the rights which all people who live in civilized lands ought to have. The man whose house is destroyed by a mob has, under such conditions, no recourse. cannot recover from the community, and of course he cannot recover from the irresponsible, propertyless rioters. He cannot trust for protection to the Government under which he lives; he can trust only to the chance that no mob will rise, or that, if a mob does rise, it will be checked. But, however broadly the State may grant to its local governments immunity for their own neglect, public opinion will justly hold them morally responsible, and will deny to them to

just that extent the right to call themselves civilized.

Great Fortunes

Every child comes into this world without anything. There are only three ways by which he can get anything: he can produce it by his industry; he can receive it from his neighbor; he can get it from the common stock.

Man can produce wealth by his industry—of brain or hand, in making goods or in finding a market for them, in service material or in service intellectual and spiritual. He may weave a piece of cloth or he may organize a factory and give employment to a thousand theretofore idle men. One is industry as truly as the other. Law ought not to put limits on honest and honorable industry. It ought to encourage, not discourage, service, whether of brain or hand. It were well if the State might levy no tax on property thus produced. If it could come by its own, it would no longer need to tax industry.

Man can receive wealth from another who already possesses it. He may receive it as a gift, as the child through his childhood receives from his parent food, clothing, shelter, education. The law may limit the amount which one man may receive by gift from another, and such limitations have sometimes been imposed. But man may also get wealth from his fellow-man otherwise than by gift: as by robbery, by theft, by fraud, by gambling. Robbery, theft, fraud, gambling, ought to be prohibited and as far as possible prevented by law. Little nefarious operations are prohibited, but not great ones the confidence game of the bunco man, but not the confidence game of the unscrupulous financier; gambling with dice, but not gambling in stocks and in grain and cotton. Senator Washburn proposed a bill to prohibit the latter form of gambling: it was defeated; it might receive more favorable consideration now.

The third method of acquiring wealth is getting it out of the common wealth of which the continent is a storehouse—out of the great forests, great prairies, great

mines, great reservoirs of oil, great rivers, great lakes, great natural forces like steam and electricity, and the great highways, whether of the Nation, the State, or the city. These belong, of right, to all the people. Under our industrial system they are offered to any man who is shrewd enough or unscrupulous enough, or both, to get possession of them.

Most if not all the enormous fortunes have been largely made by the second or the third method—by gambling operations or by getting possession of the common stock. If we accept the popular estimate of the elder Cornelius Vanderbilt's wealth at, say, \$180,000,000, and assume the popular chronology of the Bible, then we may say that if Adam had lived six thousand years, worked three hundred days each year, and laid by one hundred dollars each day, he would have earned no more than Cornelius Vanderbilt acquired in a life-Part of that \$180,000,000 he produced by productive industry, and to that he was justly entitled. But if he acquired any proportion of it from the pockets of men less shrewd than himself by gambling operations, and if he acquired any proportion of it out of the common stock by obtaining possession of one of the greatest of the Nation's great highways, to that proportion he was not entitled. The Outlook does not blame him; it does not blame other men, now living, who have acquired greater fortunes in whole or in part by the same method. It blames the industrial system which has produced both them and their methods.

What we want is not a law to take the great fortunes from their possessors when they die; we want laws which will insure to honest industry of brain and muscle all that it can produce, which will prohibit, and as far as possible prevent, all operations by which shrewd men get from their less shrewd neighbors something for nothing, and which will secure the common wealth—the oil in the ground, the unworked mines, the virgin forests, the untilled prairies, the great rivers, the unharnessed forces of nature for all the people. If we can find ways to do this—and this is not impossible we can safely leave individuals to make

as great fortunes as they can make by honest productive industry.

Evolution or Revolution?

The change from autocratic to constitutional government now in process in Russia is the result of a long-continued economic and political crisis. The economic crisis has been due, first, to the discontent of the muzhiks, or peasants, who form four-fifths of the population. The large landed proprietors are producing more than they consume; the peasants are producing less than they consume. In order somewhat to equalize conditions, it naturally occurs to the muzhik, with leagues of untilled soil a little way from his village, that the ownership of part of the arable land might well pass from landlord to peasant, especially as the muzhik has always believed that crown lands somehow would eventually belong to the peasantry. A few well-intentioned ministers have, it is true, helped the muzhik. About a quarter of a century ago the Peasants' Land Bank was created to advance money to muzhik purchasers on the security of property bought, but, though followed by the absorption of millions of acres, has only slightly relieved the pressure on the peasantry as a whole. muzhik now realizes that the general government system precludes agricultural This is emphasized by the reprogress. cent famine and the recent war-events raising agrarian problems from which the muzhiks were the first to suffer.

The economic crisis has been due, secondly, to the growth of industrialism in the towns, where a discontented proletariat class has been produced partly by material hardships, partly by the propaganda of professional agitators of communistic trades unionism among the uneducated. The agitators have not failed pertinently to call attention to the injustice between employer and employed and to the exemption of Government beneficiaries from certain rates and taxes. Hence, in many places workmen went on strike, and the crisis was only slightly

lessened by the Government's admission to the franchise of workmen representing the larger establishments. Russian "industrials," called into being largely by the genius of Count Witte, the present Premier, are now, for the first time, a factor which must be reckoned with, not only in Russia's social but also in her political structure. For the "industrials" will never be satisfied until they obtain, educationally, a sufficient number of Government-endowed schools, and, economically, a system of higher wages and fewer hours, but also, politically, a practically unrestrained access to a Parliament.

The economic crisis in Russia has been due, thirdly, to the strike of discontented Government employees themselves-post, telegraph, railway, and other employees. The disintegration produced by their strike proceeded not only because their cessation of work isolated the Russian Government last autumn from communicating with the rest of the world, or even with the Russian provinces, districts, and cities, by rail, telegraph, or telephone; it has a moral value from the fact that these employees, like the agriculturists and the industrials, up to the present practically voiceless, have now made their appearance on both the economic and the political stage. They demanded concessions. They obtained them, and more than once. These three conscious elements, then, the agriculturists, the industrials, and certain of the Government employees, brought about a material crisis, and from it constituted an argument for practical political reform.

Three additional elements, however, reinforce the argument for political reform. These latter elements form a mass no less conscious, if less coherent, than those already mentioned. First, there are the annexed races and religions. The problem as to these has always been, What shall be made of them—shall they be slaves or equals, enemies or coworkers? A century ago Alexander I.'s generous ideas triumphed; then there was tolerance by fits and starts; finally there was systematic suppression, as we have lately seen in Finland. Out of that suppression, however, has come an effort

of the annexed peoples to regain their ancient liberties, which in the case of the Finns has already been crowned with deserved success.

Again, there is the quieter but stronger influence of the zemstvoists, or members of the provincial councils. Despite the fancied evil of a large representation of the nobility among those members and the real evil of the central Government's nullification of some zemstvo activity, the general zemstvo tendency has shown itself liberal. Reactionary nobles may not freely exercise their landowners' and employers' will under that tendency. Liberal nobles are so many protagonists for its representative and reforming quality; for instance, Prince Troubetskoy has said: "His Majesty can prevent a revolution. There is but one way. He must have confidence in the nation and in its representative bodies."

Finally, there are the revolutionaries. Aside from the extremes of Nihilism in the last century and of Socialism in this. the revolutionaries who command our attention, and not infrequently awaken our respect, are the so-called "intellectuals," the survivors and representatives of the student movement. Its influence has greatly increased ever since Russian students became imbued with the spirit of Comte's positivist philosophy, in which social reorganization is the ultimate object of scientific research; and especially since 1868, when the student exiles at Geneva founded the "Narodnoye Dyelo" (The Cause of the People), and actually succeeded in smuggling it across the Russian frontier—a magazine aiming to draw away the young generation from merely academic Nihilism to more practical revolutionary activity. As usual, throttled public opinion, here represented by the exiled students, took revenge by becoming revolutionary.

There are revolutionaries so crazed by the oppression under which they have lived that they are eager to throw off that oppression at whatever cost and then let come what may. There are other revolutionaries, however, who have a definite, conscious purpose of construction as well as destruction, who keep before themselves the ideal of democracy, and are opposed to anything which does

not promise a Russian republic. If that republic ever comes into being, it may be said to have been born on January 22, 1905—"Bloody Sunday." The events of that day brought forward Father Gapon, a priest who understood the psychology of the masses in so far as defiance to a vacillating "Little Father" is concerned, but who had no clear political policy or principle. Otherwise, when he won his claim against the Government for destruction of property belonging to workmen, he would not have kept for himself part of the award, as it is alleged that he did. A Russian writer has recently confessed, "A backbone is missing both in Russian virtues and Russian vices."

One who apparently contradicts this impression is Nicolas Tchaykovsky, the friend of Kropotkin and Stepniak, and the present able representative of the Russian revolutionaries in America. An article from his pen on the Russian situation will be found in this number of The Outlook. The Tchaykovsky ideal is a republic, but the Tchaykovsky methods are apparently to be those of force. What chance of success have they? Even suppose the peasantry and the army to be more disaffected than they are, with what possibility of victory could the revolutionaries hope to pass over the present transient political stage and meet the requirements of that most advanced political form of government—a republic? Is not their surer path the one now being trod with surprising success in the present elections by the Constitutional Democrats—a party which the revolutionary as well as the State Socialists have energized in part, for in Russia, reversing the usual order, democracy has been awakened by socialism? The condemnation by the revolutionaries of the Constitutional Democrats as being too "academic" is not sustained by the favor just shown at the polls to the latter, who, accepting monarchy as an unavoidable governmental form for the present in Russia, nevertheless stand unswervingly for a Russian constitution on a democratic basis. This is the only firm and feasible footing for a change in Russia from autocracy to democracy. In France, '93 succeeded '89, and was

in turn followed by a reaction of the most extreme kind. Unless the precedents of history are misleading, in Russia reform, to be lasting, must come by peaceful evolution rather than by armed revolution.

Educational Secularization in England

The new President of the English Board of Education is Mr. Augustine Birrell, well known as the author of "Obiter Dicta," "Res Judicatæ," and other charming essays. A fortnight ago Mr. Birrell won another title to fame by introducing in the House of Commons a new Education Bill. So far as personality and style are concerned, it is a long time since any one carried the House with him as did this speaker, and if his bill should pass it would mark a distinct turning-point in English history. the first time in that history an attempt is now made to secularize British education—probably the most important phase in an educational conflict which, ever since Joseph Lancaster opened his school for education on sectarian lines, has been waged intermittently for a century, continuously for a generation.

At present English elementary instruction is controlled by the Board of Education, which came into existence six years ago. In every district instruction must be provided for resident children between the ages of five and fourteen; those between twelve and fourteen may conditionally obtain from local by-laws partial or total exemption from school attendance. Under the Education Act of 1902 the local educational authorities are the councils of counties, county boroughs, non-county boroughs with population over ten thousand, and cities with population over twenty thousand. These local authorities must establish educational committees, which in turn appoint from a majority of their members a managing council.

Prior to 1902 there were two kinds of schools in England—established by the Act of 1870—the board or public schools and the voluntary or church schools.

Both were supported in part by grants from the central Government; the board schools, however, were empowered to draw upon the local "rates" for their supplementary income; the voluntary schools were so called because largely supported by local voluntary contributions. As the school-board rate grew, it became increasingly difficult to get voluntary subscriptions, and there was a consequent decline in the quality of the voluntary schools. In the board schools unsectarian religion was taught; in the voluntary schools sectarian doctrines were inculcated. In 1902 each was educating about half of the six millions of working-class children in England.

The Education Act of 1902 co-ordinated these two classes of schools, but it did not completely co-ordinate them. The board schools were thenceforth known as "provided" schools; the voluntary schools became "aided" schools. educational expenses of the latter were paid not only by the central Government but also by the local rates—despite the agreement of 1870 by which there was never to be sectarian teaching in rateaided schools! In return for this favor the managers of the aided schools gave the use of their buildings free of charge for elementary school purposes, agreed to maintain the buildings and to comply with pedagogical requirements, including the number and qualifications of the teachers as prescribed by the local education authorities. Regarding popular control, however, the Act of 1902 gave to the public but two seats out of six on the managing committee of each "aided" school; the religious composition of those committees therefore was frequently if not generally such as to favor the application of religious tests in selecting teachers for those schools. The whole scheme reminds one somewhat of the famous Concordat, now abrogated, between Church and State in France. The English Concordat aroused a storm of protest from those who did not belong to the Established Church. They vehemently objected to being taxed twice so as to provide for Church of England teaching; they also refused to pay school taxes on the ground that a system of taxation without representation had been

instituted; there was a consequent haling to court of hundreds of these convinced "passive resisters." Their case is strengthened in the new Parliament, in which there are upwards of a hundred and seventy Dissenters, most of whom are supporters of the Liberal Cabinet and the party in power.

Their protagonist is Mr. Birrell himself, in face, manner, and style a fine example of the "early Victorian" Non-The provisions of his bill, conformist. as reported, should be welcome, not only to all dissenters from State-aided Anglican methods in particular, but to all who oppose State aid given to any sectarian school, whether Anglican, Wesleyan, Roman Catholic, or Jewish. Mr. Birrell's bill transfers the control of all schools maintained at the public expense from county and city councils to the popularly elected local school boards. The Government will no longer subsidize "aided" schools; if continued, they are to receive Government grants of money only on condition that the school managers accept the same unsectarian religious teaching as now given in the "provided" schools. Beginning with 1908, all Government schools are to be "provided" schools. The bill authorizes the local education authorities, whenever necessary or desirable, to arrange with the owners of the "aided" school buildings for such use of them as is required to carry on an elementary school five days in the week, between the hours of 9 A.M. and 4 P.M. the authorities to be responsible for the maintenance of the school building. all schools unsectarian Christian teaching may be given between 9 and 9.45 A.M., the attendance of children not to be compulsory until after 9:45; thus any parent who objects to Bible teaching. either because it is insufficient or because he is an agnostic or a non-Christian, need not send his child to school until the secular curriculum begins. By consent of the local authorities, sectarian religious instruction may be permitted on two mornings a week outside of school hours, free of any charge to the taxpayers or of compulsory attendance to the children. In cities, however,

where there is a choice of schools to which parents can send their children. extended facilities for sectarian teaching are offered: should four-fifths of the parents of children attending any particular school desire it, sectarian teaching may be given every day outside of school This is probably meant to meet the needs of the Roman Catholics and Iews, though here and there an Anglican school would benefit by it. No member of the regular staff of teachers is allowed to give sectarian religious instruction, however, nor is any religious test to be applied in the selection of teachers, who are to be chosen solely by the local authorities. Thus public control is to be supreme and absolute over every primary school supported out of the public funds. For the taking over of the "aided" schools the bill provides an additional annual grant of five million dollars to the education budget from the imperial exchequer.

Mr. Birrell's bill is confessedly not a complete educational measure; for instance, it contains nothing about training colleges for teachers; it is, however, an excellent scheme for English primary education.

The outlook is not bright for its passage through Parliament. Even if it should get through the House of Commons, it could hardly pass the House of Lords, with thirty bishops and perhaps a majority of the peers in opposition. As an indication, nevertheless, that the Church of England is not a unit under the lead of the Archbishop of Canterbury in opposing the bill, such broad-minded ecclesiastics as the Bishop of Hereford, the Dean of Ripon, and Canon Hensley Henson have already come forward in its favor. Their expressed opinions show that a popular discussion of the subject is the necessary means to bring two principles closer than before, not only to "the Nonconformist conscience," but also to the native good sense and good judgment of all Englishmen: that there shall be no public taxation without public control, and that the existence of a State Church does not necessarily involve direction of the schools.

EARTHQUAKES AND THEIR CAUSES

BY JAMES F. KEMP

Professor of Geology, Columbia University

THE past few years have brought home to people in all parts of the world, and with exceptional emphasis, the destructive work of those two mysterious geological agents, the earthquake and the volcano. Of the two, the earthquake is the more to be dreaded. It rises without warning from the unknown and invisible depths; it shakes into dismembered fragments the structures on the surface and dies away. leaving irrepressible and incurable apprehension in its wake. The volcano, on the other hand, gives warning. monitory rumblings, columns of steam and dust, and even earthquakes themselves, attest its growing restlessness. The lingerers who remain too long within the range of its bombs and ashes are the ones who run the risks. The molten lava moves too slowly to cause danger, and rarely indeed has a blast of hot gas destroyed a town as at St. Pierre. of the two the earthquake is the easier of explanation by natural causes.

Close observation of the rocky strata forming the visible portion of the earth has led inevitably to the conclusion that they have often been subjected to move-Beds which must once have ments. been flat upon the floor of the ocean are tilted at angles or bent into arches and Strata which were obviously troughs. once continuous over wide areas are now broken by great rifts called faults. and the portion on one side of the break has either risen or sunk with reference to that on the other. \vee The movement may be slight, or, in the course of time, it may become a total of imposing dimensions. North of San Francisco, for instance, on the western side of Mount St. Helena, is a fault whose displacement is estimated at 2,500 feet. The movement in all such cases has progressed, it is thought, a few feet or inches at a time.

Three great causes have been suggested by geologists for the readjustments of the rocky strata. The timehonored view is that the earth was originally a highly heated and probably gaseous mass, which has cooled, and in consequence has consolidated. Experience in deep mines and determinations with self-registering thermometers at various points in deep bore-holes have shown that the temperature rises with descent. The general rate is one degree Fahrenheit for approximately each seventy-five feet in depth. A simple calculation based upon this rate of increase soon reveals a highly elevated temperature at moderate depths. These relations and the general conception of the heated original lead to the further conclusion that the earth must be still radiating and losing heat, and therefore contract-When the loss becomes appreciable, then contraction asserts itself; the outer portion bulges in folds from the strain, or else adjusts itself along the great fissures mentioned above.

The objection to the contractional idea is this: When, with any loss of heat which we are justified in assuming, we endeavor to calculate the shrinkage, it appears to be much too small to accomplish the familiar results. Some have therefore sought another explanation, as follows:

Theearth is a rapidly rotating spheroid, and is flattened at the poles and swollen at the equator. Its shape is precisely that which centrifugal energy would produce upon a somewhat plastic, rotating mass. The flattening is proportionate to the rapidity of rotation. Were this more rapid in the past, then the polar flattening must have been greater. Is it diminishing at the present, then the spherical shape must assert itself, and a return to a true sphere must result. The return would cause readjustments; the

Digitized by Google

equatorial diameter must become less. the polar greater. Wrinkles, faults, and surface movements follow. The chief objection to this view is that we would expect our great ranges of mountains to run around the earth, roughly parallel with the equator and on either side of While the vast line of upheaval marked by the Pyrenees, the Alps, the Caucasus, and the Himalayas does coincide with the inferred direction, yet other great mountain systems run north and south as do the Andes, northeast as do the Appalachians, or northwest as do the Cordilleras.

There is one other fundamental suggestion which should be outlined before we pass to the more immediate causes of earthquakes. For the sake of analysis the spheroidal earth is imagined to consist of a series of sharply tapering pyramids whose apexes come together at the center and whose bases form the sur-Despite the apparent stiffness and resistance of rocks, considered in small masses, they must, when taken in huge masses, such as these pyramids, balance one another, and the earth must preserve equilibrium as does a drop of water. If we add to the bases of some pyramids, and increase their weight, they will overbalance others and cause the surface elsewhere to bulge outward. Readjustments follow. Now, the rivers, shore currents, and tides are constantly wearing away the land and piling up the materials in other places on the sea bottom. After a time the balance around the center is altered, and movements result.

There may be other causes than these three, and ones of which we are as yet uninformed, yet the above are the ones in which the chief confidence has been hitherto placed.

Let us now return to earthquakes, and, admitting the movements and readjustments, see if they throw light on the cause of these vibrations in the rocky strata. When the shocks occur in regions remote from volcanoes, we have no reason to connect the two phenomena. For these localities we must turn to something else. The fault furnishes the most probable cause. From time to time, when the strain becomes too great for the sides

longer to resist, a slip occurs. Great masses of rock move along on others, until, with a jar almost inconceivably great, they come suddenly to rest. Vibrations spread in every direction, and when they reach the surface and have the much lighter atmosphere alone to restrain the movement, they become very violent. In their march they pass through different kinds of rocks. Some varieties transmit the shock better than others or vibrate at different rates. Their adhesion may not be able to resist the strain, and they part, leaving crevices or rents. When the shock passes from hard rocks to soft and incoherent sands or gravel, critical places are met, and if a crevice does not form, the sands may be shaken up and settle. When the earthquake passes to the crest of a cliff and causes a precipitous front to swing back and forth like a cantilever standing on end, the upper portion may be wrenched away from the rest and fall with a crash. Were a great hotel placed upon such a cliff above a beach or above the water below, it might go off in a heap of ruins.

In the special case of San Francisco, the inquiry is natural, Are these faults in its vicinity? There are several, and they have been long recognized. As much as twelve or thirteen years ago Professor A. C. Lawson, of the State University, established the existence of two principal ones and others of a minor character on the peninsula upon whose northern point the city stands. The two master faults run northwest and southeast. They look off with precipitous escarpments toward the southwest. slipping down upon these or upon others like them is the most natural explanation which can be advanced for the Realizing this faulted structure. and knowing from the records of shocks in California, which have been very carefully kept, that the State is a fruitful field for disturbances, many geologists have looked for some years for the appearance of a great one. While no such destruction was anticipated as we have recently seen, it was felt that the behavior of tall steel buildings would be tested. On the whole, they seem to have stood well.

The San Francisco shock differs in

one respect from other notable ones along a coast line. No tidal wave seems to have been caused, at least none which wrought havoc. Yet in the great Lisbon earthquake it was rather the onrush of the sea than the fall of the buildings which destroyed the victims. That fire should follow the shock and consume even the uninjured buildings is an experience at once exceptional and harrowing.

In volcanic regions earthquakes are one of the common attendant features of eruptions. While even amid these surroundings they may be produced by the slipping along faults, yet there are other causes more closely connected with the eruptive outbreaks. Thus one of the common forms in which the hardened lava appears in a volcanic district is the one called a dike. A mass of molten rock has been forced from below into a fissure and has there consolidated. It is revealed as a relatively narrow, dark band crossing older strata. All visitors to the shore resorts along the coast north of Boston are familiar with them, since the "trap dike" is one of the most striking features of the cliffs. At Nahant something like five hundred have been mapped within a rather small area. A moment's reflection will show that a wedge of this character could not have been driven into a fissure without starting not only one but numerous shocks. And as we have every reason to infer that the movement of the eruptive rock deep within the earth at any active cone of to-day is reproducing these familiar phenomena of eroded and dissected volcanic districts. so we naturally refer the shocks in part to the entrance of dikes.

But there are other possible causes. The records of the self-registering instruments in volcanic districts sometimes exhibit curves whose characters are similar to those obtained when great quantities of dynamite are exploded in engineering operations. So far as possible, scientific men improve the opportunity to record and study the earth vibrations whenever blasting takes place on an unusually large scale. For example, at the excavation of the old reefs at Hell Gate, in the East River, New York City, the oscillations were very carefully investigated, twenty-five or thirty years

ago. When, therefore, similar records are obtained near a volcano, the presumption is raised that some subterranean explosion has occasioned them. Lava, we know, comes to the surface highly charged with steam and other gases. Explosions, often of enormous violence, take place in the crater. Were the uprising tide of heated rock to encounter quickly a body of water and cause it to flash into steam, a shock would inevitably result, analogous to the work of dynamite.

But, again, still other possible causes may not be overlooked. The outpouring of lava removes in a brief period of time a vast volume of rock from the interior. For example, one of the flows from Hecla, in Iceland, has been estimated to be equal in volume to Mont Blanc. rocks surrounding the reservoir whence this passed to the surface must have closed in and readjustments quite sufficient to produce shocks could not but result. Even in mining regions where great amounts of coal or ore have been removed without due precautions, the collapse of the wall-rock has caused small earthquake shocks, which have spread to moderate distances and have caused alarm to local residents.

The uprising of mineral springs and of waters carrying in solution former components of the rocks underground may in time transfer much material to the surface and lead to collapses which produce mild shocks.

In many minds the question at once arose, when the news from San Francisco spread abroad, Has the earthquake any connection with the eruption of Vesuvius which is now subsiding? The coincidence in time is somewhat striking, but when one reflects on the thousands of miles of ocean and continent separating the two localities and upon the superficial nature of the two phenomena as compared both with the horizontal distance and with the diameter of the earth, it is impossible to reach any other conclusion than that the connection was purely fortuitous. California is a place of rather frequent shocks. Vesuvius, with short intervals of comparative repose, is almost constantly in eruption. It is not surprising that a

shock and an outbreak, each of somewhat exceptional severity, happened near-

ly together.

Much interest has been felt by investigators in determining the probable depths at which earthquake shocks originate. The method pursued is as follows: We believe that from some interior place the vibrations spread in roughly spherical The place where the waves first emerge at the surface will be directly over the place of origin, since this is the shortest course, or will be nearly so, for rocks of different conductivity may be involved. If, therefore, we can carefully learn the times at which the shock was first felt in different localities, and mark these on a map, the later times will surround the earliest in widening circles. The earliest time will be approximately over the place of origin.

Again, if we have instruments which show the direction and angle of emergence of the waves, or if, in a few concentric places, we can determine this in any other way, we can project the wavepaths downward, and the point where they intersect the radius of the earth passing through the point of earliest shock will be the place of origin. It is improbable that earthquakes from slipping originate at a greater depth, even in the hardest rocks, than six miles.

Instead of the times of emergence we may use the violence of the shock, as shown by the destruction of buildings, and plot upon a map an interior area of greatest effect, surrounded by concentric circular areas of diminishing injury. The area of greatest destruction usually corresponds quite closely with the place of earliest emergence, or, in other words, with the place immediately over the point of origin. Order and system of observation and deduction may thus be established, and from what would otherwise be almost hopeless confusion some tangible conclusions may be drawn. Undoubtedly this course will be at once undertaken by some of the San Francisco scientists, and their results may be awaited with interest.

THE PRAYER OF SOCRATES

BY JOHN H. FINLEY

Socrates

Ere we leave this friendly sky, And cool Ilyssus flowing by, Change the shrill cicala's song For the clamor of the throng, Let us make a parting prayer To the gods of earth and air.

Phædrus

My wish, O Friend, accords with thine; Say thou the prayer, it shall be mine.

Socrates

This, then, I ask, O thou beloved Pan, And all ye other gods: Help, as ye can, That I may prosper in the inner man;

Grant ye that what I have or yet may win Of those the outer things may be akin. And constantly at peace with those within;

May I regard the wise the rich, and care Myself for no more gold, as my earth-share, Than he who's of an honest heart can bear.

THE SPECTATOR VISITS A BUFFALO HERD

I was the morning after the close of the recent Sportsmen's Show in Boston, and the Spectatorentered the main hall of the Mechanics' Building to watch the removal of the animals which

had been on exhibition, and which were now to be returned to their respective homes. A man clad in light corduroy had just entered a pen containing elk, which he intended to remove in separate crates, one of which was even then at the door of the pen. There were three animals in the inclosure, two does and a superb stag, as large as a horse

and crowned with massive, pointed antlers. This creature was evidently in a bad temper. He had been in close confinement for three weeks, and now the presence of the man seemed to make him furious. He strode up and down, held his head high in the air, turned back his lips, and ground his teeth until the sound could be heard all over the large Suddenly there was a chorus of "Ohs" from the crowd about the pen as the big brute sprang forward and with almost incredible speed struck out with both fore feet. Quick as he was, the man was quicker; otherwise the Spectator would have been writing some other story. And the man, smiling just as though it was not Death he had shaken hands with, prepared to throw a lariat over the horns of the angry stag.

moment later the noose left his hand and whirled in the but as air. touched an antler the great elk flung it off, charged upon his would-be captor, and, with a scythe-like sweep of his antlers, knocked the man down and speared him through the thigh. Quick as a cat the man was on his feet again, and, though bleeding profusely, went quietly on with his work, and did not stop until not only the stag, but both the does, were safe in the crates and ready to put on the cars. Then, after giving orders con-

cerning the shipment of some other animals, he allowed himself to be taken to a surgeon.

The Spectator was interested. Here was a man who took risks as other men took oatmeal for their breakfast, and who juggled with his life as if he had a dozen more in reserve.

"Who is he?" was asked of the man left in charge of the work.

"Why, that's Will Morrison, of Corbin Park—the Corbin buffalo man some people call him, because he's had charge of the Corbin herd for sixteen years, and is said to know more about the breeding and handling of buffaloes than any other man alive."

"Why, how many buffaloes are there at Corbin Park?"

"Don't know; biggest herd in the country, anyhow; Morrison could have told you all about it."

One bright, frosty afternoon, not long after the above conversation, the Spectator alighted at the little railway station at Newport, New Hampshire, and, declining the assistance of the hackmen, started on the six-mile walk to Corbin

WILL MORRISON AND SOME OF HIS CHARGES

Park to have a chat with "the Corbin buffalo man." After leaving the busy little town, the road stretched. northward through flattish country covered with spotless snow, but far in front there loomed up a range of forested mountains. The sleighing was excellent, and the Spectator had not walked more than a mile when the rapid jingling of bells in the rear announced the approach of a sleigh, evidently drawn by a fast-trotting horse. As it drew near, a glance behind revealed a great brown stallion

fairly flinging the road behind him, and through the shower of snow which mingled with the flying mane and tail could be seen the form of the driver. The latter reined in his splendid horse with a steady pull, and a broad Scotch voice asked, "Will ye ride?" It was Will Morrison, the "buffalo man" himself.

The invitation was promptly accepted, and the Spectator, pulling one end of a heavy sleigh-robe over his knees, found himself snatched along beside the very man he had come to see.

On learning that he himself was the special object of the visit, Morrison was highly amused, but promised all possible information concerning the game preserve in general and the buffalo herd in particular. The line of mountains we saw in front of us were for the most part in Corbin Park, he said, and were a part of the twenty-four thousand acres inclosed by a thirty-mile fence. The preserve contained, besides the great buffalo herd, large numbers of Virginia deer, elk, wild boar, and some moose. The deer and the moose got their own living the year round, but the buffalo,

elk, and boar required feeding in the winter. In answer to an inquiry as to whether the animals did not become too numerous, Morrison said that they were never allowed to; that the deer and elk and boar were thinned out regularly every fall and winter. Last winter over two hundred deer were taken out, some alive for the restocking of other preserves and others dead for the market. It had not been necessary to take out more than half that number this year, but nearly a hundred elk and almost as many boar had been shipped away.

The brown stallion was now making good time over a woodland road, which ran along a hillside, from which were caught occasional glimpses of the park. Great stretches of evergreen forest, alternating with belts of hardwood, doubtless marked the hiding-places of thousands of wild creatures which found a home in the great preserve, while broad snow-fields on the mountain sides showed where the buffaloes would find good grazing in the spring.

Another mile through a shower of hoof-tossed snow, and presently the big horse swung round a bend in the lane and stopped before a tall gate, and from a sign above it concerning hunting and fishing, and signed "Austin Corbin," the Spectator knew that he had arrived. Morrison opened the gate, and presently drove along a road which traversed a large amphitheater of meadow land, surrounded by woods. The road itself was bordered by an avenue of young white pines, and at the end of this there was seen a neat red building, long and low, from whose chimneys white smoke curled cheerfully against the dark mountains which rose behind. Beyond the house were many buildings, including an immense barn, all in perfect order and painted red like the house. The whole place bore the stamp of order and good management.

Morrison put up his horse, quickly changed his coat for one of light corduroy, and invited the Spectator to go with him and get an idea of his evening's work. This work consisted chiefly in feeding the animals under his care. Scarcely had our footsteps sounded on the floor of the barn than from a dozen directions came expectant voices—the whinnying of horses, the lowing of cows,

FEEDING

the bleating of sheep and goats, and the whining of puppy dogs. And, with a kindly smile on his bronzed face, Morrison went from stall to stall, from pen to pen, distributing, besides the welcome food, a gentle word, a pat, or a stroke to each of his many charges. And over each he ran his experienced eye, noting at once the least thing wrong. Here a horse had received a scratch which needed and received attention; there a goat was not getting her fair share of food, and was quickly lifted into another pen where there was less competition. He knew each individual animal by sight, and most of them by names he had given them. And they knew the man, and trusted him. Not one was there that was nervous in his presence; not one that would not allow him to handle it as he pleased.

This work was about finished when a man was seen filling a sack at one of the corn-bins.

"Hello, Charley! Going to feed the boar?" cried Morrison; and on receiving an affirmative answer, he inquired if the Spectator would not like to go into the woods and see how the wild boar were fed in winter. The Spectator being willing, snow-shoes were produced, and the party set out. After passing through a well-wooded inclosure known as Number 4, which contains several acres and which is used to hold elk and other animals intended to be shipped alive, the main park was reached, and Charley led the way to the feeding-grounds.

The latter were not far away, for presently the guide turned from the trail and entered a bit of dense spruce woodland entirely clear of undergrowth. The snow on the floor of this woodland was beaten down hard, by wild boars, it was presently explained. Charley now threw down his sack and began to distribute his corn; and he did so after the manner of a sower, strewing it far and wide, a handful at a time. Asked why he scattered it thus, he answered that this method assured all the animals an equal chance and gave them exercise which they needed and which they would not get if they found the grain in heaps.

It was now getting dusk, and as Charley told us that the boar would soon be coming in, we decided to wait and watch them. Each member of the party crouched behind the trunk of a big spruce, near the outskirts of the woodland. The Spectator had picked out a splendid tree for this purpose, but Morrison suggested that as it was on the windward side of the feeding-ground, the boar would starve to death before they would venture in with the human odor in their nostrils. So there was nothing to do but move to another tree on the side away from the wind.

After watching for perhaps ten minutes in silence, there came a grunting sound which told us that the boar were on the march. It was very much like the grunting of domestic pigs, and soon there came some vigorous squeals, as though the animals were squabbling over something. Then, as the Spectator looked off through the trees, he saw a number of boar running toward the feeding-grounds in single file. Only the upper halves of their bodies were visible, for they were coming along a deep, trenchlike trail which had been beaten in the snow during previous journeys to and from the feeding-grounds. In a moment the leaders arrived, and at once began to pick up the nearest grains of corn. Before long there were more grunts from a distance, and other herds of boar were seen coming in from different parts of the woodland. In a few minutes there were some forty animals of all sizes, running back and forth in every direction, picking up the corn as if they were doing it on a wager. There was nothing slow about these pigs; they were active, muscular beasts, apparently full of health, and ready at an instant's notice either to fight or to run for their lives. They were of all ages—some small, and evidently born last spring, for they still bore traces of the stripes which, Morrison said, were characteristic of young wild boars, and others huge gray, hairy brutes, weighing perhaps two hundred and fifty pounds, and with gleaming white tusks, the sight of which made the Spectator glad that he was near a tree. Every pig of the lot was absorbed with his interesting occupation of gobbling up the scattered corn, when suddenly the wind changed for a moment and blew from behind us

directly over the feeding-ground. Instantly a dozen of the animals started as if bullets had struck them. Then, after an almost imperceptible pause, there came a storm of disgusted "whoofs" which sounded as though the pigs were attempting to blow from their nostrils the obnoxious odor with which they had been offended, and the next instant a few savage, rolling grunts set the whole herd in rapid motion, and they fled for life along their deeply beaten snow-paths leading to the deeper recesses of the forest.

It was now too dark to think of seeing the buffaloes, so the Spectator accepted an invitation to stay all night at the low red building, which, with the ground which surrounds it, is known as "Central Station." After supper he was shown into a neat, clean little room by the housekeeper, who first, however, showed him with pride the room which had been occupied by President Roosevelt when he visited the park some years ago.

After an early breakfast, Morrison led the way to the buffalo yards, where his special charges spend the winter months. Down a narrow lane we went, until, rounding a turn, we saw a high and heavy wooden gate; it barred the en-

trance to the first of the buffalo yards. As the Spectator approached it he saw a group of perhaps a score of brown creatures which reminded him more or less of domestic calves, except that they had longer horns, longer hair, shorter necks, and a much greater appearance of strength and vigor. As the gate was opened these creatures stared very hard for a moment, then threw their short tails in the air, and galloped like mad to the farther end of the inclosure, where they turned and stared as before.

"Those," said Morrison, "are the babies. They're only ten months old." Then to the buffalo calves, "Hello, bossies, d'ye want some hay?" And, going to the door of a shed, he took out an armful, clean and sweet-scented, and in a moment the youngsters had surrounded him and were eating from his hands. The Spectator asked to be allowed to feed them too, but when he held out the hay the calves backed up and stood in a circle about three feet off, eying him with suspicion. He advanced a foot, but they retreated about as much. and it was only after ten minutes of patient waiting that two or three of the boldest calves consented to thrust their hairy little faces forward and take a mouthful of the food held out to them.

A YOUNGSTER

A PATRIARCH

Splendid, healthy-looking, bright-eyed creatures, these—every movement full of rugged character; nervous enough to stampede if necessary, but apparently not vicious in the least. Morrison threw them some more hay and led the way to the next yard.

Here, evidently, were the grown-up buffaloes, but the Spectator was disappointed. There were about fifty—splendid animals all of them—but they were not what the Spectator had pictured to himself as the former lords of the prairies. Perhaps, after all, the great size and grandeur of the buffalo had been exaggerated, and he was simply paying for his credulity with disappointment. With half an apology he asked if these were the largest animals in the herd, and it was with considerable relief that he learned that this yard contained nothing but young stock, and that there were larger animals to see.

In the next yard the Spectator saw what his fancy had painted, and more,

for there he found buffaloes like those he had read about—like those old plainsmen had told him of; only he felt that none of the descriptions had done the animals justice. Here was grandeur difficult to describe in words-grandeur which depended not wholly upon the form and bearing of the kingly beasts themselves, but partly on what they stand These were not merely animals: they were living, moving pictures from the pages of early American history. The Indians who hunted them, and whose lives depended on them; the pioneers, whose tasks would often have proved insurmountable but for the presence of the great wild ox; the early settlers, whose hard lives would have been harder still but for the buffalo—all these have passed away forever; yet this great picturesque figure still remainsin small numbers, to be sure—a valuable aid to the study of the history of those early times.

As the Spectator watched the giant

forms before him the fences seemed to fade away; Morrison and all connected with Corbin Park were for the time forgotten, and in place of the buffalo yards he saw in imagination a limitless prairie. rich brown as far as the eye could reach with a myriad marching buffalo. Hundreds of thousands there were in sight, and millions, perhaps, beyond. The scene changed, and the Spectator stood in front of the great medicine tent in a Mandan Indian village. A band of "braves" had assembled, and each, donning a mask made from the skin of a buffalo's head with the horns upon it. and taking a bow or spear in his hand, joined in the weird ceremony known as the "buffalo dance," performed in order "to make the buffalo come." Then he saw the naked Indian hunters, astride the bare backs of their well-trained ponies, ride into the thick of a flying herd, shooting down the shaggy monsters in full flight, while the air was filled with the sound of rolling thunder and the earth itself trembled beneath the impact of their countless hoofs. Again the scene changed, and he saw a herd of buffalo standing in the snow, watching in calm preparedness the approach of a great gray wolf. But he saw what the buffaloes did not see-the bronzed and sinewy arm of an Indian steal from the shoulder of the wolf, and he marked the flight of the long, keen arrow as it whistled to its mark and caused the nearest bull to sink upon his knees. Once more there was a change of scene, and the white man came in hordes and camped upon the prairie, and soon the

turf was soaked with blood and the air polluted with the rotting carcasses of unnumbered buffalo. The white man disappeared, and the moonlit prairie gleamed with whitened skulls and bones, practically all that was left of one of the grandest animals that ever trod the globe.

It was with a feeling of relief that the Spectator came back to the present, to see that little band of healthy, vigorous creatures. Here at least was proof positive that the buffalo was not quite a thing of the past, and a suggestion that, if action was taken promptly, the great race might yet be saved from extinction. Then came the recollection of a recent account of the organization of a society which has for its object the preservation of the buffalo. The particulars had escaped the Spectator's memory, but as he shook hands and bid Morrison goodby he asked, "Do you know anything about a society which has just been formed to save the buffalo?"

"The American Bison Society, ye mean? Well, I ken a bit. But ye see that highest peak yonder [pointing to Croydon Mountain]? Well, the secretary lives right over there at Meriden. Theodore Roosevelt's the president of it, ye ken, an' that's a gude sign. The buffalo is the grandest beast in this country, or in ony country for that matter, and he should never be allowed to dee out. And I dinna think he will dee out, if folks'll only back Roosevelt. That lad says the buffalo maun hae his due, so he maun hae it, mark ye, for the hour has come and the mon,"

BIRDS OF THE SEA LEINLEY & H.T.BOHLMAN

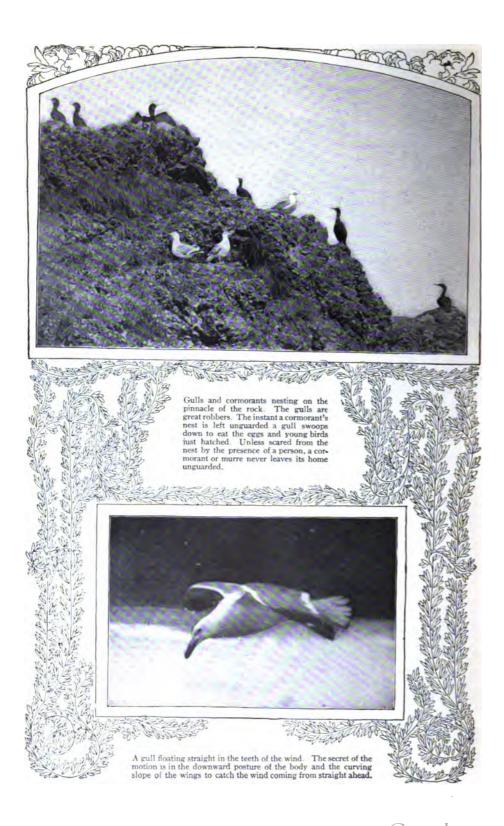

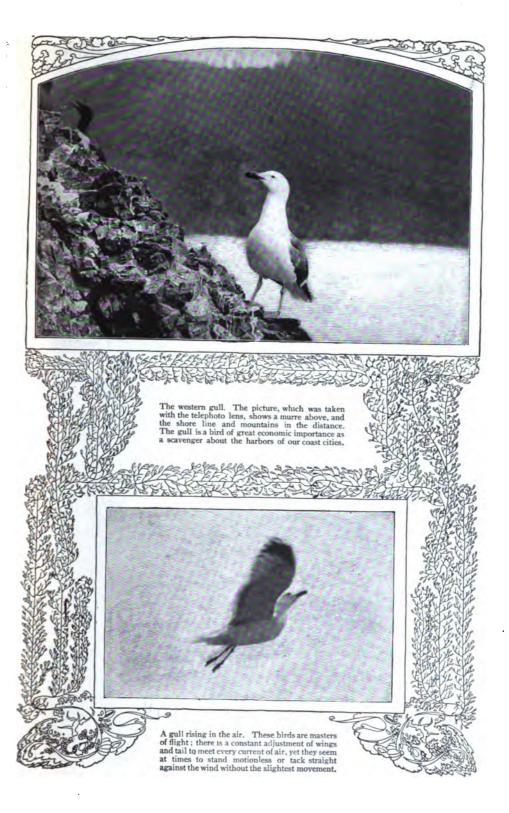

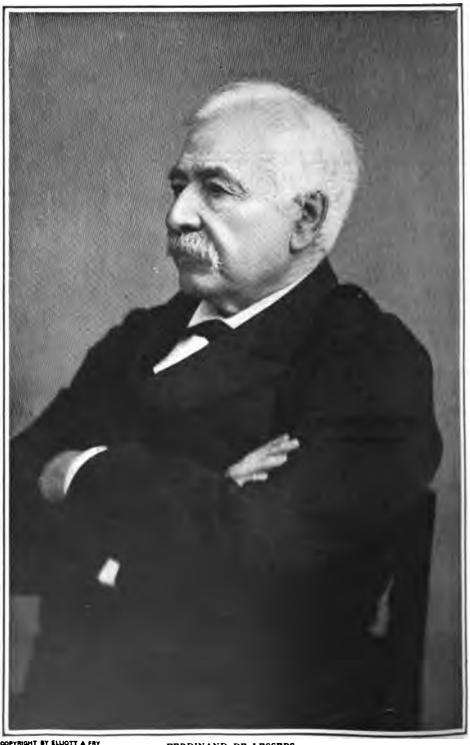

FERDINAND DE LESSEPS

THE PANAMA CANAL

History—Conditions—Prospects BY JOHN FOSTER CARR

First Paper

USTING after gold and adventure, the explorers of the sixteenth century eagerly scoured the seas of the western Atlantic, and searched the rivers and bays of America for the shorter course to the Indies. The Northwest Passage was a universal dream, and for nearly two centuries life and treasure were squandered in its vain quest. Yet

undauntedly Spaniards took up the splendid alternative of a canal across the Isthmus almost as soon as Balboa, with the young Pizarro, had clambered up the jungle-covered heights of a Darien peak and discovered the Pacific. Angel Saavedra, a galleon's captain, or a man of arms-for the tales differ-in 1520 made the first suggestion to pierce the Isthmus. Soon afterwards Cortez had Tehuantepec surveyed for a canal. Nicaragua found its first advocate in an Alvaredo in 1535,

and it was in 1551 that Lopez de Gomara first talked of the advantages of Panama. His eloquence finally moved the heavy-jawed and morose Philip of Spain to send two Flemish engineers to examine the Isthmus. Charles V. found time from his wars and imperial intrigues to study the project; but he soon grew wearied and disgusted over the impossible task, and

threatened death to the man who should again speak of it.

Balboa had his ship carried spar by by spar through the matted forest and over the divide, and for more than three hundred years the plundered gold of Peru and the spoil of commerce were borne on mule-back to Porto Bello or over the paved Cruces road to the Chagres. But before the final destruction of her empire Spain again grappled with the problem which only the pyramid-buildcould have solved without mod-

ern machinery. In the winter of 1814 the Cortes ordered work begun on Tehuantepec; again a survey was made, but the scheme died out in an unused concession. The French interest in a canal dates back to the early forties, when Garella reported to Paris a well-developed Again the project was actively discussed, and the proposed routes multiplied until there were seven of them. The last of the princes in the list, the futile Louis Napoleon, in exile at Ham, meditated a grandiose scheme for an Isthmian waterway to which his Imperial name should be given.

Practical beginnings of work at Panama were made in the brief, businesslike surveys of the young naval lieutenants Réclus and Wyse in 1876, 1877, and 1878. Upon their labors De Lesseps based his first great plan for a sea-level

canal. He was a diplomat and not an engineer; but his prestige, his enthusiasm, his genius for organization, made the scheme a popular success. He had carried through the Suez project when some of the most eminent engineers of the day had said that a canal at Suez would become a stagnant ditch, that the sands of the desert would fill it, that it would be impossible to keep open its entrances, that labor sufficient could never be found. But M. de Lesseps appealed to the pride of France in those excited days of '81. He became the idol of the nation, and over two hundred thousand people, men and women of every class, rushed to subscribe to his scheme.

Never since the days of the South Sea Company had there been such a national frenzy of speculation. Again the un-

BALBOA
The Discoverer of the Pacific

known wealth of Spanish America was the bait, and it is said that, in the end, securities amounting to a face value of nearly \$440,000,000 were sold. An old French engineer in Panama has told me the story of the failure of De Lesseps. Neither yellow fever nor engineering difficulties prevented his success; it was thievery and "graft." During the eight years when work was being done on the Isthmus there was an orgy of extravagance in Paris. The bankers seized upon perhaps half of their subscriptions, Senators and Deputies had to be bought

by the dozen, contractors and manufacturers with influence made great fortunes, and the blackmailing press grew rich with bribes. Work stopped in 1889, and again the days of the South Sea Bubble were recalled; for the crash of the Canal Company beggared tens of thousands and brought a crisis in the nation. The Ministry resigned, ten Senators and Deputies were directly inculpated, suicides and arrests became the order of the day. Men said that Prince Victor was in Paris. Royalist plotters were busy about the Duc d'Orléans. But the

According to the plan recommended by the Isthmian Canal Commission of 1999-1901, and inferentially adopted by Congress in the Act approved June 28, 1902. This plan is for a lock canal at an 85-ft. level

storm died down in protracted investigations, and a number of the responsible promoters, under promise of immunity from prosecution, were allowed to reorganize the company on condition of raising a capital of \$12,000,000 to proceed with the work. Henceforth economy reigned; plans were carefully restudied; energies were concentrated on the mountain of Culebra. But the confidence of the peasant investors of France was definitely lost, and it was seen to be impossible to charm another hundred millions from their pockets. Progress became fitful, until, with the exhaustion of financial supplies, it ceased altogether, and the only hope of the company lay in selling outright to the United States.

A dozen different Colombian interests—patriotic, speculative, corrupt—conspired to defeat the Hay-Herran treaty. When the news of its rejection came, the whole Isthmus was thrown into despair. Radical measures were needed or Panama would lose its long-promised prosperity; and the revolution of 1903 was soon being plotted by the notables of the city as they met in each other's houses over the savory sancocho stew. There were a few men of character and standing to head it, and they had the help of as fine a band of whispering conspirators and professional revolutionists—some of them Americans—as ever strode the boards of comic opera.

Dr. Amador, who became the first President of the fledgling republic, was sent to New York on a mysterious mission. His first cable message was the word "Disappointed;" his second, before his return, "Hopes." The official historian of the movement, in bombastic adjectives of praise, describes the event of the final stroke. It had long been rumored that General Huertas, the commander of the Colombian garrison in Panama, was to be removed by the Government at Bogotá. He therefore became a speedy convert to the revolutionary cause. The uprising of the people was set for the 4th of November, but the arrival of a Colombian war-ship off Colon in the early morning of the 3d precipitated the great act.

COLON Executation done up to February. ON THE PLAN SHOWN ON THE OPPOSITE Exoavation remaining to be done at that time Summit Level Length 21.58 Mile

Four of the new detachment of generals were rash enough to cross the Isthmus alone. In the small plaza before the Cathedral, set like a stage with its palms and benches, the conspirators assembled. Twice the generals visited the barracks. "With great acuteness General Huertas took note of his critical position, and realized that, in spite of the apparent affability of his superior officers, a tremendous tempest was about to burst upon his head. Then, in a moment of sublime heroism, he resolved to execute a plan as bold as it was dangerous. He ordered a captain with a squad of thirty men to arrest the generals. He narrowly observed his army, but his orders were carried out without a hitch, and the prisoners were marched to the police station accompanied by some of the conspirators and by a part of the populace." No war game played by two college professors was ever more bloodless than this revolution, and if you sniff a doubt at the

Charles E. Magoon, Governor of the Canal Zone Brigadier-General O. H. Ernst, Engineer Corps Joseph Bucklin Bishop, Secretary Rear-Admiral M. T. Endkoott, U. S. N. Benjamın M. Harrod, C. E. Brigades-General P. C. Hains, U. S. A., retired Theodore P. Shonta, Chairman

official version, you will have pointed out to you in the Cathedral Plaza the very man who paid the Colombian generals their \$8,000.

Among the mixed results of so much buffoonery, the people of the Isthmus at least won freedom from Colombian oppression; the Canal was saved to the French stockholders to be transmitted to us at a better bargain than we had ever dreamed of getting; and a number of the conspirators acquired fortunes that are considered large when judged by Panamanian standards.

The interest of the French in the Canal was not political, but speculative, commercial. It spoke to their idealism and roused a delirium of enthusiasm. A Frenchman had pierced the Isthmus of Suez, and the same Frenchman was to transport the Straits of Magellan to Panama and complete a great equatorial highway for commerce that would belt the globe. For the United States, present interest in the Canal is more political than commercial. While we have been becoming a great world power, and the dominant nation of the West, the Monroe Doctrine has been developing from a benevolent will to oppose foreign aggression when it threatens a weaker neighborhood to a calm assertion of paramountcy. Our isolation has ended in a logical growth of policy involving no violent break with the past. Hamilton foresaw it when he wrote in the "Federalist" that "our situation prompts us to aim at an ascendant in American affairs." There is no rivalry for the possession of the Canal, but Panama has become as important to the United States as Suez is to Great Britain. America has become to us like the Balkan States to Europe, with Cipriano Castro playing the Sultan's part. We carefully avoid interference in the domestic politics of these southern republics, but their turbulence and the incapacity of their governments may at any time burst into a dangerous conflict with Europe. With the open canal our naval power for offense and defense will be doubled. The ocean coasts of the United States will be drawn nine thousand miles nearer each other, and it will be possible to concentrate our fleets in three weeks—a

feat that might otherwise require three months.

The recent expansion of the United States has made the Pacific almost an American ocean, and we are beginning to see with Captain Mahan that the empire of the sea is the empire of the world. Our coast line on the borders of that ocean is nearly as great as that of Russia, China, and the islands of Japan taken together. With a single small interruption, it runs from Mexico to the Arctic, circling by the Aleutian Islands almost to the northern shores of the Japanese Empire. Then, beginning close to Formosa, the Philippines stretch for more than a thousand miles along the coast of Asia. The Canal will not only give us a highway to lands where some of our most necessary food staples are produced; it will bring Japan, China, Siberia, and Australia as near the Atlantic seaboard and our chief manufacturing centers as they now are to western Europe. In other words, it will give us an equality in competition for the trade of half the population of the earth. Our commerce with the awakening East is already developing by such leaps and bounds that before the Canal can be finished it will have become a greater commercial than political necessity. Consider the recent growth of our trade with the Far East, in spite of our scanty merchant marines. Our imports from Asia and Oceania have mounted from 105 millions in 1891 to 185 millions in 1905. During the same time our exports to these far countries and islands of the Pacific have more than quintupled. late as 1895 they were only thirty millions; by last year they had risen to 161 millions. As the industry and intelligence of the Nation becomes organized for greater conquests of commerce we shall build ships equal to the demands of our trade. As it is, although Panama will divert little European traffic from Suez, the merchant fleet of Great Britain. the great carrying power of the world, will be the first to profit from the new waterway.

At midday in the Caribbean the sea looks like indigo oil; the sun blazes all about you and the heat is heavy. The

noon bell rings; the officer on the bridge takes the position of the sun, makes his calculation, and the day's run is posted up in the companionway. You study his chart more closely as you approach Colon, and you find that the Isthmus is a place of surprising geography. It runs east and west, and not north and south; and the western end of the Canal lies east of the eastern end. Colon is more than two hundred miles south of the northernmost point of South America.

and disordered succession. It is not very hot, but you had not thought that the sunlight could be so flaming and blinding, the shadows so black, the green of the leaves so dazzling. Colon has about it something of a Southern village, something of a mining town. It is a wooden encampment, a dusty—in the rainy season a muddy—city of shacks. The grime and hustle of the canal work fill the streets. The "Engineering News" lies about on the little round tables of

DIGGING A DRAINAGE CANAL IN COLON

These canals will be connected with the sea, permitting a fast flow of sea water through them

An old resident tells you that in Panama the sun rises in the Pacific and sets behind a rugged chain of hills—the beginnings of the Rockies. You get a large map in the chart-room, and you discover that the Canal is almost in a line with Pittsburg, and that the continent of South America is swung by the Isthmus, as by the great arm of an Atlas, so far out into the Atlantic that the whole of it lies east-of the longitude of Savannah.

You land at an ancient dock, and your first impressions of the Isthmus are vivid, and come crowding upon you in rapid

the cafés, and men in loud voices tell each other how the Canal ought to be built. English is spoken everywhere, and the Panamanian is almost a stranger in this one of his two largest towns. You walk out in the direction of Fox River; you see a house on stilts with green scum beneath it, and you remember that your train leaves at four-thirty.

For the first ten miles the railroad runs mostly through swamp land. The trees, creepers, and ferns are gorgeously, tropically, they seem even dangerously, beautiful. At Bohio you reach higher

ENTRANCE TO THE MAIN CULEBRA CUT

ground, and the country gradually becomes rolling, hilly, almost mountainous in places. Negroes swarm about all the stations; and continually getting on and off the train, nervously quick in their movements and full of business talk, are ruddy and sunbrowned white men in khaki breeches and brown leather leggings, in colored shirts and cowboy hats. A dog's-eared memorandum-book, a surveyor's pole, a quiet "hello," tell you that they are all fellow-employees of the Isthmian Canal Commission. In the last ten miles, before Panama mountains fill the distance, the near-by hills are bolder and show their volcanic origin. You begin to wonder that you have never read that the Isthmus is a beautiful place. You see the Bay of Panama and its lofty mountain islands, and you think that it should be famous among bays for its loveliness.

Panama itself needs to be known well. It dominates the Isthmus and is the crux of many of the difficulties our Government has to face. The overhanging balconies, the red-tiled roofs, the dazzling 958

plastered walls, that seem all white in the direct sun, are relics of old Spain. But you see many costly stone houses abandoned, crumbling to decay, and splendid churches of which only bare, roofless walls remain. Walking on the sea-beaten ramparts of Las Bovedas by moonlight, the romantic history of the ruined city throws a spell over you. But to know the people you must study them by the broad light of day.

They are very unlike in appearance, not molded to one type by ancient blending, as in Taboga. You will hear fullblooded Africans speaking Spanish. You will see a swarthy policeman with Indian cheek-bones and Chinese almond eyes. You may meet a slender, graceful woman with soft black eyes and a face of Spanish pallor. A thin black shawl is over her head and wound tightly around her body. You will bargain in the clatter of the market with the oldest wife of them all. She has the face of a squaw and wears her hair in two braids, each plaited close behind the ear. Her skin shows startlingly dark out of her low-cut

white blouse. They are all Panamanians and all equal, and yet from those in which the white blood predominates the aristocracy and the ruling class are formed. Still, the different races are here in the melting-pot, and the Indian beyond the Zone, the negroes along the line of the Canal, and the diluted Spanish of the towns are fusing, and a national type is slowly being evolved. The mark of the Indian is stamped heavily upon it; there is nearly always a trace

of the negro; only a lightened skin tells of the white.

Although no two Panamanians look the same, there is yet a likeness of character that is national. The Isthmus is the land of mañana—and of a long-deferred to-morrow—where proverbs of up and doing are unknown. Mañana is the word you hear most often along the streets and from the open doors and windows. I went with a friend to the custom-house for a trunk that had come

on a preceding steamer. The official stared stonily and dreamily at us, blew a ring from his cigarette, and said, "Manaña." We returned the next day, and were told to come again on the next. We finally had to appeal to an American of authority.

The primal curse seems remitted in Panama. Men do not need to labor in order to eat, and the large local profits of truck-farming no more excite the poor native's ambition than the generous wages paid laborers on the Canal. Of the 22,000 employees of the Commission and the Panama Railroad only about 500 are Panamanians. The native will sell what he has in the garden, if he is tempted with a good price, but no desire "to get ahead" leads him to quick replanting. The soil is marvelously fertile, but vegetables are scarce and dear.

Oranges and bananas are poor and cost as much as in our Middle West. Sleek cattle, the pride of the Isthmus, are seen everywhere along the railroad, but Ancon Hospital cannot buy milk for less than \$1.20 gold a gallon, and the only butter you can buy comes from Denmark. Indolence lies like a blight over the whole land, and you are not astonished when you are told that there was not a savings bank in the Republic of Panama until our advent.

Colonel Gorgas, the Chief Sanitary Officer, believes that this is less the result of tropical degeneracy than of malaria and the hook-worm disease. In an extensive series of microscopical tests made by his department it was found that more than seventy per cent. of the natives examined had the malarial parasite in their blood. Their physique is so

uniformly poor that our American boys seem a race of giants beside them. Yet the tropics undeniably have a powerful effect in producing sloth. At home selfhelp is the condition of existence, but in Panama the handicap of nature is not livening and tonic like the cold of the north. Such eternal summer reigns that the falling flowers of some overhanging tree are always floating down the Chagres. Nature is prolific, and the rapidly advancing jungle must be fought through a great part of the year in depressing heat. It is so difficult an enemy to overcome that the crushed stone roadbed of the railway can be kept free of vegetation only by frequent spraying with a solution of arsenic. The jungle is so dense that a party of surveying engineers hacking their way through it with machetes passed within twenty feet on

either side of a hill as high as a threestory house without seeing it. It was only discovered when the ground was completely cleared for a careful survey. It takes energy to get on in the world in the face of such obstacles.

Panama is a republic precisely after the kind of those of South America. The old civilization inherited from the Spaniards is decaying. Many of the virtues of the Spaniards have disappeared; many of their vices have survived. There is a perfect lust of blood, seen in cock fights, bull fights, and in the incredible ferocity of the policeman when he makes an arrest in which the smallest amount of force is necessary. Colombia passed through fifty-three revolutions in fifty-seven years, and in Panama, its emancipated province, revolution is still thought of as an ordinary legal

Photographed by the author

process of election. It is now a very general expectation that an attempt at revolution will accompany the next election. Secretary Root's letter pledging the United States not to interfere with the liberties of Panama is interpreted to mean that fighting without the Zone will be permitted. Distinction is not made between a declaration of policy and the legal right to suppress disorder which our Government may assert at any necessary time.

To complete the picture: The Panamanian who succeeds is generally either foreign born, or of more virile foreign extraction. The men of eight families hold all the realities of political and financial power in Panama. One is Cuban, one is English, two are Colombian, three are Jewish; only one is of the ordinary mixed Panamanian blood, and he has his position, not through his own force or ability, but by the accident of marriage. One of them has the tobacco monopoly, just renewed, though all monopolies were abolished by the Constitution. Another has the market concession. A third has the lottery. A fourth makes a handsome yearly sum from the assessments of liquor licenses and from blackmail levied on gamblers—and gambling of all kinds is strictly forbidden by the Constitution. Another has the telephone and telegraph concession. Another enjoys various banking privileges, and another is the Fiscal Agent and the head of the cattle trust. New forms of "graft" are being continually discovered.

Bolivar gave his life to an attempt to weld the ancestors of these Panamanians, and their kinsmen, into a great and free nation. His dying words were: "I have plowed in the sea." We have adopted the generous and impossible faith that the Panamanian is a man the equal of all other men; and as far as his salvation depends upon us, it is bound up in that faith. But we shall need to take care to see that we do not treat him like a child and spoil him like a child.

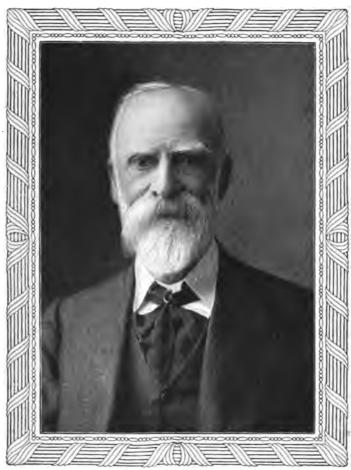

Into the quiet streets and plazas of Panama our men have come like an invading army. They have brought an incessant din with them, from typewriter,

saw, hammer. The sound of pick, shovel, and stone-crusher rings loud under the balconies as they rush the paving of the newly christened "Central Avenue." A foreman like Kipling's type American "shambles forth in cosmic guise," and with his brisk "Come on! Come on!" he makes his gangs of Jamaicans and Martiniquans work as I have seen negroes work nowhere else on the Isthmus. And this is only one thing of the thousand they are doing. Reservoirs and pumping stations are being built to supply the entire line; Colon is being sewered and paved; new quarters, hotels, houses for married folks, hospitals, are going up everywhere; huge docks are under way at Colon and La Boca. They are double-tracking the railroad; fifteen seventy and ninety ton shovels are excavating between Pedro Miguel and Bas Obispo. A vast network of rails is being laid to carry off the spoil from the great The sanitary men are at work in every division inspecting, burning, fumigating. I have talked with the judges of the courts; watched the work of the police managing crowds, making an arrest, patrolling the savannahs. I have seen the plan for the organization of a fire department, for the building of schools. I have attended the first teachers' convention ever held on the Isthmus, where a dozen papers in pedagogy were read—one of them on Expressive Reading, another on Children's Farm Gardens.

Gradually there pieces itself together a splendid human story. You begin to understand that our Republic is doing something more on the Isthmus than the mere building of a canal. It is creating a State with all the machinery and equipment of our home civilization adapted to strange needs. The work is being done in a hurry, but it is being done Not perfectly, as these articles may show, but still well enough to justify the pride of the Nation. Best of all, it is being done at no serious cost of life. Less than a week ago I attended morning inspection of the fever wards of Ancon, our largest hospital. About fifty patients were being cared for; only one of them was in peril of death.

Panama, Republic of Panama.

THE RIGHT HONORABLE JAMES BRYCE Chief Secretary for Ireland

THE NEW IRISH GOVERNMENT

BY JUSTIN McCARTHY

Author of "A History of Our Own Times," etc., etc.

HE results of the recent general elections and the arrival of Lord Aberdeen for the second time as Lord Lieutenant of Ireland must have seemed to the Irish people like the opening of a new era for their country. There was, indeed, a common impression everywhere throughout these islands that the new Liberal Government must be greatly strengthened in power by the results of the appeal to the country. But it was hardly expected anywhere,

so far as I know, that the defeat of the Conservative party could be so absolute and so overwhelming as it proved to be. It will be remembered that Sir Henry Campbell-Bannerman and his colleagues had come into office because the Conservative Government under Mr. Arthur James Balfour did not care to face the immense financial and political difficulties into which they had brought themselves, and probably thought their best chance lay in resigning and in leaving

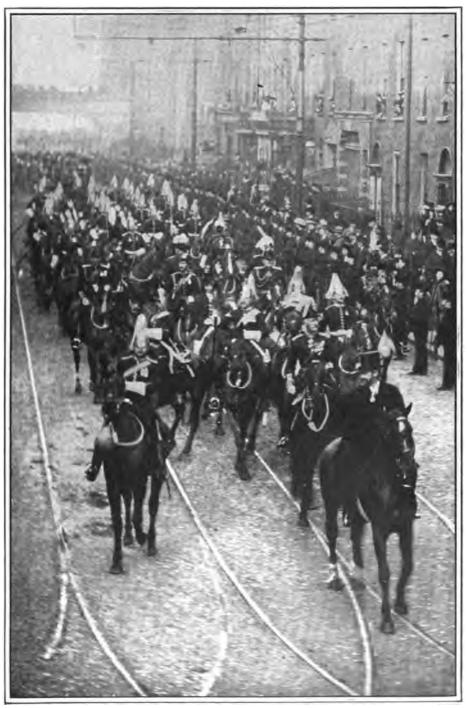

Digitized by Google

to a Liberal Government unprepared for such a responsibility to make the best they could of the conditions bequeathed to them, or to fail utterly in the attempt, and thus mar their chances for the The Liberal Government, however, very wisely determined to throw upon their Tory predecessors the full responsibility for their ten years of office, and to appeal at once to the constituencies of all Great Britain and Ireland for their deciding choice between the two political parties. The choice de-. clared itself, I need hardly say, in a majority for the Liberals the like of which has never been known in the history of that party, or of any other party here since the great Reform Bill of 1832. In all recent generations a Ministry has been held safe and strong which could count on a majority of 100 in a party division—the Liberal Ministry under Sir Henry Campbell-Bannerman has already on several occasions defeated the Conservatives by majorities of more than 300.

Under these auspicious conditions Lord Aberdeen occupies for the second time the Irish Viceroyalty. Nearly twenty years have passed since Lord Aberdeen's first appointment to the place which he now holds. The first appointment was given to him by Mr. Gladstone at the time when Gladstone brought out in the House of Commons his earlier measure for the granting of Home Rule to Ireland. At that time, however, there were no such prospects open to a Viceroy of Lord Aberdeen's principles as those which welcome him now. When he first came to Ireland as Viceroy, the great mass of the Irish people were ready to give him their most cordial welcome because he came as the representative of a Home Rule policy, but few indeed had any real hope just then that Gladstone's great reform was des-Yet it must be said tined to success. that no Irish Viceroy had ever before been sent to Dublin who endeared himself more to the people he was commissioned to govern than did Lord Aberdeen during the short time allowed to him by adverse political fate for his maintenance of the office. He would, of course, have been welcome in any case

were it only because he came as the representative of the Home Rule policy, but he soon showed personal gifts and graces, a generous heart, a sympathetic spirit, and an intellectual capacity which must have won for him the admiration and the affection of the Irish people. He now returns to Ireland the same man, to hold the same position, but under very different conditions. He is now in Ireland as the representative of the strongest Liberal Government we have had for many generations. The present Prime Minister has long been a proclaimed Home Ruler, and in his Government leading places are held by men like John Morley, James Bryce, and many others who have always in the darkest times for Home Rule held firmly to its principle.

The Irish Nationalist party is stronger now in numbers than it ever was before, and is thoroughly united in political purpose and has even won some seats from that Orange province of Ulster which at one time made itself the camping-ground of every anti-Irish faction. Then it has to be added that the Labor party, which is now for the first time a numerous and powerful party in the House of Commons, is prepared to stand shoulder to shoulder with the Irish Nationalists on the question of Home Rule for Ireland. Within the last few years, also, some of the British colonies have in their local parliaments passed strong resolutions calling upon the Parliament at Westminster to grant Ireland's demand for the right of governing her own domestic affairs while remaining under these altered conditions a contented and loyal partner in the British Empire. My American readers will readily understand what a difference these changes make between the conditions of Lord Aberdeen's former mission to Ireland and the conditions which welcome his second Vicerovalty there. The present Liberal Government have not thus far delivered any formal announcement of their resolve to bring in a Home Rule measure at any definite time. But it has been clearly made known by Sir Henry Campbell-Bannerman and by other leading members of his administration that the principle is accepted, and that when the

STATE ENTRY OF THE LORD LIEUTENANT INTO DUBLIN

LADY ABERDEEN

huge burden of unfinished work left upon their hands by their predecessors shall have been dealt with to some reasonable extent, and when the errors of their predecessors shall have been as far as possible corrected, the Government will begin the movement to give to Ireland her right and her system of selfgovernment.

Lord Aberdeen was not trained to political life in the House of Commons, because he succeeded too early to his family title, which gave him at once a place in the House of Lords. A man of ability. devoted to a political life, loses much by having no training in the stirring and vivid debates of the House of Commons. The House of Lords is for the most part a rather dull assembly; its meetings do not usually occupy more than an hour or two; it very seldom becomes the scene of any great parliamentary struggle, and only on rare occasions listens to a really important and thrilling debate. There are always some powerful speakers and eloquent debaters in the House of Lords, but most of these have come from the representative chamber by the succession to or gift of a title, and some of these have already accomplished the great political work of their lives and do not feel called upon to trouble themselves much about making a display in the unstimulating atmosphere of the House of Lords. Aberdeen, however, soon gave evidence in the Peers' chamber that nature had given him some of the best qualities of a parliamentary debater. He had a fine voice, had been a devoted student of literature and art as well as of history and politics, had a ready and fluent utterance, and a remarkable power of sustained argument; and these qualifi-. cations were enhanced by his fine figure and handsome face. Lord Aberdeen soon discovered that the old-fashioned Conservative political principles were not suited to his progressive mind, and he became before long an advanced Liberal and a devoted follower of Glad-The result was that Gladstone stone. soon saw in him a man who could render high service to the State if only the State allowed him opportunity; and when he brought in his Home Rule measure,

he made Lord Aberdeen Lord Lieutenant of Ireland. I have often wondered whether Gladstone did not at the time take account of some other advantages possessed by Lord Aberdeen which must help to make him especially welcome to a susceptible and enthusiastic people like those of Ireland. Lord Aberdeen was the husband of one of the most gifted and charming women that it has ever been my good fortune to meet. Lady Aberdeen was the daughter of a noble house, and she always appeared to me as if nature had especially designed her to be the wife of the man whom she had accepted as her husband. She was a handsome and singularly interesting woman, endowed with a remarkably fine intellect, a most attractive manner, and a generous love and devotion for every noble cause and enterprise. Her whole life seems to have been guided by a love for humanity and a sympathy with human suffering, and she had a certain instinctive originality of perception which made her an invaluable companion, and often, I should think, an invaluable guide to a husband with such a career before him as that which was assigned to Lord She had been in a certain Aberdeen. sense a ruling power, among some sections of the aristocratic and fashionable society of London, and she had won that position, not by making herself an exponent of fashion or a light of aristocracy, but by devoting herself to the cause of the poor and suffering. Lady Aberdeen was a true and energetic champion of the genuine emancipation of woman, and she accomplished her work with such grace and such sympathetic charm that the humorists of the time, who loved to describe the advocates of women's rights as unsexed declaimers and termagants. could not but feel that Lady Aberdeen was in herself a living refutation of their satirical arguments and illustrations. For all her high intellect and her practical activity in the cause of progress and human welfare, she was the very type of gentle and graceful womanhood. who were interested in the cause of Ireland could not but feel that the career of Lord Aberdeen as Lord Lieutenant must be sustained and advanced in every way by the companionship of such a wife

Digitized by Google

and every one who knew anything of the pair knew that they lived in the most thorough companionship of feelings and of purposes. I had at that time, and for long after, many opportunities of meeting Lord and Lady Aberdeen, and I am therefore not depending merely on the testimony of others, however well qualified to judge, when I thus give my ideas as to the qualifications of both alike for the work which they then undertook and are now undertaking once again. The impression which Lord and Lady Aberdeen made on the people of Ireland during their stay in Dublin on that first occasion was exactly what those who knew them must have anticipated.

The Viceroy in Ireland had up to that time, except in rare instances, represented merely the mastery which English rule had enforced upon a reluctant and resisting people. Dublin Castle, the home of the Lord-Lieutenant, was the social as well as the official center of all that part of the community who maintained the principle of English domina-It need hardly be said that that part of the community was very small indeed so far as numbers were concerned, and consisted almost altogether of the landlord class and such of the Dublin shopkeeping classes as were dependent mainly on Castle patronage. The whole national population of Ireland had no more to do with the social life of Dublin Castle than with the social life. if there be any such, of the planet Mars. Lord Aberdeen and his wife changed at once these conditions of official life in London. They offered their most liberal hospitality to Home Rulers and Nationalists, and at the Viceregal festivities were to be frequently met Irish Home Rule members who had been denounced, over and over again, by leading London newspapers as the enemies of peace and order, the promoters of assassination, and the instigators of civil war. All this was done without the slightest suggestion that the host and hostess were making an effort to secure a welcome in Ireland, but merely as if they were welcoming familiar guests to the Viceregal home. Lord and Lady Aberdeen have, indeed, always been in the habit of associating in England with Irish Nationalists as

freely and as genially as with advanced English and Scotch Radicals, and it costs them no more effort to be friendly in one place than in the other.

Up to that time, however, it would have been difficult to meet with an Irish Nationalist in the Dublin home of an Irish Viceroy, for even if the Viceroy were to invite the Irish National representative the Nationalist could hardly accept the invitation, because its acceptance might lay him open to the odious suspicion that he was seeking to court the favor of Dublin Castle and might thus be regarded as failing in his devotion to his National cause. Now the Irish Lord-Lieutenant and his wife had come to Dublin as proclaimed advocates of Home Rule, and they were welcomed by a national enthusiasm rarely expressed or felt by the Irish people for the representative of English dominion Ireland.

My American readers know already how the golden promise of that happy time was not destined then to be realized. Gladstone failed in carrying his first Home Rule measure through the House of Commons, and the great Liberal leader went out of office. Lord Aberdeen went out of office with his chief, and he and his wife took their leave of Dublin amid public demonstrations of gratitude, affection, and regret such as an ordinary mortal, living before those days and unendowed with prophetic vision, could hardly have believed it possible for a British Viceroy and his wife to receive in the Irish national capital. When the Liberals came into power again, Mr. Gladstone brought in his second Home Rule measure and succeeded in carrying it through the House of Commons, but, almost as a matter of course, it was rejected when brought up for consideration by the House of Lords. There was nothing astonishing or alarming to the advocates of Home Rule in this action on the part of the hereditary chamber. Every measure of political reform brought forward in England is sure to be rejected by the House of Lords when first it is sent up to them. We all know that it will have to be sent up to them time after time until they can at last bring themselves to recognize the fact that the majority of

DUBLIN CASTLE

THE OLD PARLIAMENT HOUSE

Now the Bank of Ireland

the constituencies are determined to carry the measure, and that further resistance may be fraught with danger to the principle of legislation by hereditary lawmakers.

The appointment of Lord Aberdeen has especial and peculiar interest and importance just at present. It is well known that there are in the new Liberal Government, and even in the new Liberal Cabinet itself, some members whose minds do not seem to be quite made up on the subject of Home Rule. I do not know that any one of these has proclaimed or is likely to proclaim himself an absolute opponent of Home Rule; but it is certain that some of the new Ministers give to it only a qualified and rather reluctant acceptance, and are anxious to put off as long as possible the raising of the whole question in Parliament. Under these conditions it is a matter of the highest importance that Lord Aberdeen has been sent to Ireland as Lord Lieutenant. It would have been quite easy for the Prime Minister, had he been so inclined, to obtain the appointment to the Lord Lieutenancy for some Peer who, even if a Home Ruler, had never pledged himself publicly to the principle, and thus have allowed uncertain Liberals to hope that the question was not pressing, according to the judgment of the new Ministry. But when it was made known that the Prime Minister had chosen as the Government's representative in Ireland a man like Lord Aberdeen, already devoted heart and ... soul to the cause of Home Rule, there came an end to all possible doubt as to the policy of the men who will lead the new Government. The appointment has been welcomed with the utmost delight by the Irish people. If the whole event were _ to have no other result, it might well be a subject of congratulation to every patriotic Englishman and Irishman, because it will at least help to make it evident that the more Liberal an English Prime Minister is, the more firm he is to the Home Rule principle, and the more thoroughly he recognizes that Home Rule for Ireland must be a blessing to the English as well as to the Irish people.

It is no part of my purpose in this article to say much about Lord Aber-

deen's career as Governor-General of Canada. When, some years after the failure of Gladstone's first Reform measure, the Liberal party came back into power, Mr. Gladstone appointed Lord Aberdeen to act as the representative of English rule in Canada—one of the highest and most important positions which can be given to an English public man. It is enough to say that Lord Aberdeen and his wife made themselves as popular in Canada as they had been in Ireland, and were regarded with equal confidence and admiration by the French as by the British Canadians. To accomplish such a success as this is indeed as high a proof as can well be given of statesmanlike impartiality, sympathy, and justice. My object in this article is to speak of Lord Aberdeen as he showed himself in his dealings with Ireland, and we have him now once again as a representative Dublin Castle of a Government pledged as a whole to the principle of Home Rule for Ireland.

The return of Lord Aberdeen to his former position bears, in one of its conditions, a special and peculiar resemblance to his first appearance on that political stage. When he came to Ireland for the first time, he brought with him as Chief Secretary a man who had won an equal fame in literature and in politics-Mr. John Morley. Now that he comes for the second time, he brings with him another man who also stands in the foremost rank of authors and of Parliamentary statesmen. It is a curious fact that in a volume of "British Political Portraits," which was published for me in the United States nearly three years ago, I said that, "In a certain sense, James Bryce might be described as belonging to that Parliamentary order in the front of which John Morley stands just now." There was at that time but little prospect of any return of the Liberal party to power in England, and there was not, in my mind, any thought of the possibility that James Bryce might come to hold the same position under Lord Aberdeen in Ireland that John Morley had already held.

James Bryce is one of the very foremost of modern historians. His work "The Holy Roman Empire" is already

recognized as one of our modern classics. and his book "The American Commonwealth" must be well known in the United States. He was born in Ireland, but his family belonged, I believe, to Scotland, and the city in which he was born, Belfast, has much of the Caledonian atmosphere about it. Belfast is the leading city in that small part of Ireland which still strives to hold out against Home Rule, but is becoming less and less able to maintain its old influence in Parliamentary representation. James Bryce was educated at the University of Glasgow and at Trinity College, Oxford; studied at the Bar, and practiced the profession for a time; became Professor of Civil Law at Oxford, and afterwards gave up that position and went in for a life devoted at once to letters and to politics. He made a distinct mark in the House of Commons, and although he could hardly be described as an orator in the higher sense, he was unquestionably one of the influential debaters in the House. His speeches were always instructive, dealt closely with every subject on which he had to address the House; he never spoke on any question concerning which he had not something of his own to say, and never addressed the House when he did not feel himself compelled by his own knowledge of the subject to take a part in the debate. He was always listened to with the closest and deepest attention, for the good reason that every member of the House well knew that when James Bryce arose to speak the House would be sure to hear something which it would not willingly lose. He was from the beginning an advanced Liberal, to use a phrase familiar in our Parliamentary world, and carrying with it a distinct meaning. He was also a strong advocate of Home Rule for Ireland. He soon won an acknowledged reputation in the House of Commons. When the Liberals came into power, he was made Under Secretary for Foreign Affairs, and during a later Liberal administration Chancellor of the Duchy of Lancaster. As successor to John Morley he becomes the latest of a trio of gifted and high-minded men appointed to the office of Irish Chief Secretary,

and I cannot doubt that Bryce will show himself during his work in that position as a fitting successor to the other two.

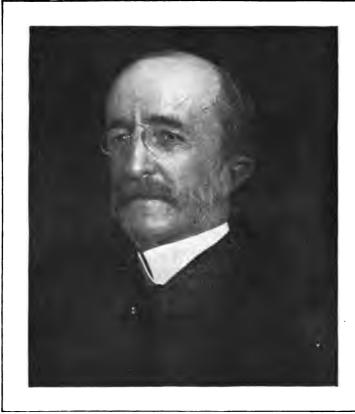

Thomas Drummond was an Edinburgh man by birth, distinguished himself in practical science, then turned to political work, and in 1835 was made Irish Secretary. During his stay in Ireland he thoroughly gained the affections of the people by his absolute impartiality, his sympathy, and his resolute efforts to sustain the Irish peasantry against the tyranny of the landlord class, whom it was the fashion of the ruling British powers in those days to endow with an almost absolute mastery over the tenants. One of Drummond's famous phrases, "Property has its duties as well as its rights," has made itself memorable in the history of Ireland, and it was upon the principle embodied in that phrase that Drummond ever acted while he had to do with the government of Ireland. It may seem to many readers in our times nothing better than a truism, but in the days of Drummond it must have seemed to the ruling class in Ireland an audacious heresy, and some generations had to pass away and many troubles had to be gone through before it became a recognized maxim of constitutional law in the government of Ireland. Each of these three men-Drummond, Morley, and Bryce-had, it will be seen, won celebrity in other than political life before he was appointed to the office of Irish Secretary. John Morley now holds one of the highest positions which can be given by an English Prime Minister the office of Secretary of State for India; and that fact in itself shows how well the present administration must feel satisfied with the work which he was able to accomplish during his opportunities of Irish administration.

I do not, however, desire to convey the idea that no one but an advocate of Home Rule could now make himself popular as representative in Ireland of a British Government. The late Viceroy of Ireland, Earl Dudley, represented, in Dublin Castle, a Government positively pledged to resist the demand for Home Rule, and yet I know that he and his wife won the full respect, and even the affectionate regard, of the Irish peo-

ple, and that their leaving Ireland on the fall of the Conservative Ministry was made the occasion for a most impressive demonstration of popular regard and grateful feeling. The reason for this was that Lord Dudley and his wife did ail in their power to show their thorough sympathy with the Irish people in everything outside the range of political movements: did all they could to help the poor; to make the administration of the laws equitable and merciful; to improve the condition of the farming and the laboring classes; to spread education, and to make the homes of the poor The Irish people knew perfectly well that it was not within Lord Dudley's power, even had he been thus inclined, to help the cause of Home Rule, but they were fair-minded enough to see that the Viceroy and Lady Dudley were sincerely anxious to promote the happiness of the people around them, and to work in the cause of humanity. Lady Dudley helped her husband in his good work with untiring energy and sympathy, and the Irish people would be the last in the world to fail in the recognition of

such purposes and such merits merely because the Lord-Lieutenant and his wife were not advocates of Home Rule. I have been reading lately an article written and signed by my friend T. P. O'Connor, in which he pays the highest tribute to the work done by Lord and Lady Dudley during the late Viceroyalty, and to the manner in which that work was recognized and appreciated by the Irish people. My readers in the United States do not need to be told that T. P. O'Connor is one of the most thoroughgoing, as he is one of the most gifted, among the leading members of the Irish Home Rulers in the House of Commons, and that the praise which he gives to a Conservative and anti-Home Rule Viceroy of Ireland and his wife must have been well deserved. I have to say is that the one great cause of estrangement between Lord Dudley and the Irish people does not exist in the case of Lord Aberdeen and James Bryce, and that the Irish Lord Lieutenant and Chief Secretary are now in political as well as in personal sympathy with the people whom they are sent to govern.

DR. TRUDEAU

EDWARD L. TRUDEAU: A DEVOTED PUBLIC SERVANT

WENTY years ago a young physician, unknown outside a small circle of men in his profession, had been carrying on a series of experiments in a room in his house in Saranac Lake, and while he lay ill in New York during a temporary visit to that city, the lamp used for heating the thermostat in the little experiment station exploded, and in a few minutes the home and the workshop were totally destroyed. Two days later this note came from Dr. Osler:

"Dear Trudeau: I am sorry to hear of your misfortune, but, take my word for it, there is nothing like a fire to make a man do the Phœnix trick."

The great physician not only made a prophecy which has been brilliantly fulfilled, but he described the career of the sick man upon whom had fallen one of those blows which often prostrate strong men and send them to that shabby shelter of the unheroic and ineffective-bad luck, or fate. Dr. Edward L. Trudeau, educated at the Lycée Bonaparte in Paris, graduating from the College of Physicians and Surgeons in the city of New York in 1871, had barely set out in that city on what promised to be an exceptionally successful career when he fell a victim to tuberculosis of the lungs and sentence of death was pronounced

Digitized by Google

upon him. On the ruins of those early hopes, with a courage as intrepid as Ney's, he has accomplished a work which puts him in the front rank of scientists in his field, and has rendered a service to his generation which places him among the first public men of America.

Two years later, in 1888, Robert Louis Stevenson was in Saranac Lake railing against the climate and nursing a wood fire with much picturesque and minatory language. The house in which he lived stood on a plateau overlooking the river, and within sight of a bold sweep of mountains. Those who saw the author of "Treasure Island" that winter will never forget the contrast between that fiery spirit and his surroundings. To see him pacing up and down his living-room, his long hair tossed impatiently back from his forehead, pausing now and again to stir up or hug the fire, and then resuming his quick tramp to the accompaniment of the most vivid description, the most telling criticism, the most exaggerated, semi-humorous condemnation of everything American and wintry, and then to catch sight of the dark river, the bleak opening in the hills, the stretch of still white landscape, made one feel as if some spirit from the tropics had delayed too long the southward flight and was fighting for cheerful vitality in the rigorous northern woods. Stevenson was artist to the tips of those sensitive hands of his; he loved warmth, color, light, and joy, and hated cold, darkness, disease, and death. Dr. Trudeau, on the other hand, was facing and fighting these terrible facts with very little support or comprehension in those days, and giving to a community slowly rising round him a revelation of heroism as great as Stevenson's, a self-denial far more exacting, and a beauty of character and life which have given hope and peace to a multitude who were slow to learn that beauty is in the skill of the artist far more than in the material on which he works.

There has been a surfeit of late of the kind of achievement which, expressing itself in fortune or position, reveals, when the light of revelation falls on it, a pitiful emptiness of spiritual meaning and turns to shabby tragedy in the light of its own

success; it is time to set out the careers of those who have touched the goal and may be ranked with the successful men of their age. Such men are modest and shun the lower kinds of praise, the cheap imitation of reputation which most newspaper notoriety means; but good works ought not to be hidden when evil works intrude themselves at every turn; and, after the pitiful procession of failures who have lately filed across the stage, the country needs the tonic of the vision of the successful man.

Thirty-two years ago Dr. Trudeau went to the Adirondacks to spend a few months hunting rabbits and then to die as other consumptives died. The great stretch of forest, with its multitudinous lakes, was known to men who used the rod and gun and to a few adventurous lovers of outdoor life; but the young physician, whose career had been ended at its very beginning, was a pioneer of the great host who have since found health and life in the bracing air of the pine forests. Saranac Lake was forty-two miles from a railroad; a primitive village with a sawmill and less than a dozen houses and a handful of people; now it is a community of six thousand souls, of whom between seven and eight hundred are health-seekers or the friends who have come with them. "old resident" told the writer the other day, you could have bought a long stretch of frontage on the main road through what is now the center of the town for eight hundred dollars; now "you can't buy a piece big enough to set down on for a thousand dollars."

When Dr. Trudeau found that a summer in the woods helped him, he resolved to spend the winter in the same surroundings. It was a radical step to take, and there were the usual dismal predictions which accompany the launching of new ideas and movements; but the sick man held to his purpose and found the dry cold, severe as it was, beneficent and kindly. He began to hope for a few years more of life; he even began to dream of some professional work. His first winter in Saranac Lake was spent out-of-doors; he and one other man, who sought refuge in the village, were the advance guard of the army of

health-seekers. There was little interest in consumption among physicians, and it was generally accepted as a form of fate by its victims. A Silesian physician had published several articles, to which small attention was paid here or abroad, urging the curative effect of out-of-door life in all weather, and insisting that the locality was of less importance than the manner of life; and that nutrition, rest, and open air were prime factors in throwing off tubercular diseases. Dr. Trudeau had been moving in the same direction, and was confirmed rather than led by Dr. Brehmer's experiments and conclusions.

After several years in the invigorating Adirondack air he recovered his power of working, and faced the fact that whatever he was to do must be done where he was. He was practically alone; a long distance from a railroad; without apparatus or money; crippled in health and an exile for life. Under these conditions he began a career which has been marvelously fruitful in three directions.

He was eager to make a test of the new methods of treatment, and conceived the idea of founding a sanitarium at Saranac Lake. Dr. Alfred Loomis gave the new enterprise the backing of his great professional reputation, and the earliest of the large group of devoted friends whom this single-hearted physician has bound to himself with bands of steel furnished the necessary means. A site was selected on a sheltered hillside commanding a noble view to the east and south, and two small buildings were put up; the first cottage consisted of one room, was heated by a wood stove and lighted by a kerosene lamp, and cost three hundred and fifty dollars. was a small covered piazza, and there, with two patients, began the first out-ofdoor treatment of consumption in this country.

On this beautiful hillside, with Whiteface and Marcy and their kindred peaks against the horizon, and the river flowing through the heart of the landscape, there is now a charming village of about twenty-five attractive buildings; including a picture sque stone chapel, a large assembly-room where fur-clad audiences gather

for plays and other entertainments, and where, with a temperature below zero and the many-windowed sides of the room wide open, ardent billiard-players pursue the game without regard to weather. There are a library, an infirmary, a corps of trained and devoted physicians and nurses, and every appliance which science has devised to fight this terrible disease. When the first cottage was opened, there was no money for physicians or nurses; there was widespread skepticism among physicians, and the feeling that exposure in such a climate was little short of suicidal was so general that it was difficult to fill the beds. Dr. Trudeau has lived to see a large community rise about his first modest venture; to have a million dollars pass through his hands for construction, equipment, endowment, and support; to develop a large institution free from the institutional atmosphere; to accumulate an endowment fund of about three hundred thousand dollars; to organize a staff of expert physicians and nurses; to be compelled to raise every year a deficit of about twenty thousand dollars. The Sanitarium needs a further endowment of half a million dollars, and the need ought to be met at once. A work of such magnitude and importance, created and carried on for twenty years by a semi-invalid, ought not to rest on that willing but overburdened courage any longer. patient costs the institution about nine dollars a week and pays five! A more vigorous and interested group of patients has never been collected than the men and women who live the out-of-door life on the piazzas by night and by day, or tramp over the hills about Saranac Lake.

In the field of institutional work Dr. Trudeau has also lived to see an imposing sanitarium erected by the State within a distance of two miles, two similar institutions organized in other parts of the Adirondacks, a large number of such institutions starting into existence in remote sections of the country, and to be constantly consulted with reference to their construction and management. He has also had the satisfaction of seeing a generous and far-sighted woman, who was formerly his patient, build a most attractive and thoroughly equipped hos-

pital on one of the most beautiful sites in the village.

Not content with providing the conditions and to test methods of treatment, Dr. Trudeau became a scientist as well as a physician, and side by side with his curative work he has carried on the work of an original investigator. A paper by Dr. Koch, published in 1883, inspired him to make an exhaustive study of the nature of tuberculosis, and started him on an ardent and patient search for a preventive and a remedy. His first laboratory, the destruction of which has been noted, was a small room in his house, and his only apparatus a microscope. He devised and made his apparatus as he went along, and, after many failures, he obtained the tubercle bacillus in pure cultures, and with these cultures began his experiments in inoculation. His guinea-pigs were kept in a hole under ground, heated by a kerosene lamp; there were no other accommodations in Saranac Lake in which these humble helpers in scientific research would not have frozen to death. He studied the conditions of infection, the effect of different conditions on inoculation, the production of artificial immunity in animals, tested all specific methods of treatment and cure, made a long series of experiments with tuberculin; every phase, aspect, and condition in any way related to the disease in any stage was subjected to the most searching analysis, and a long list of publications preserves the record of more than two decades of tireless study and experi-Dr. Koch, Dr. von Behren, and Dr. Trudeau have been patiently moving to the same great and benignant endthe discovery of an antitoxin which shall destroy the tubercular bacillus and rid the world of one of its most terrible scourges.

The value that scientific men attach to Dr. Trudeau's experiments is brought out in a recent paper by Dr. Flexner, of the University of Pennsylvania:

To whom belong the credit of protective inoculation against tuberculosis? In biological science, as in the physical sciences, discovery proceeds, not by isolated independent observation of fact, but by orderly procession. Even the newest, most unexpected, and startling discoveries are bound

up with previous knowledge. The successful attempts to produce immunity from bovine tuberculosis do not stand out as isolated performances, but are merely the ultimata of many unsuccessful and some partially successful experiments which have gone before. It is a matter of congratulation and National pride that the two essential prerequisites to the later important studies upon tuberculosis just cited should have been supplied by American investigators. The first of these was the demonstration by Theobald Smith of the differences between bovine and human tubercle bacilli; the second, the protection by Trudeau and de Schwenitz of rabbits and guinea-pigs from certain tuberculous infections by previous inoculation with tubercle bacilli of diminished virulence. Because of the high intrinsic value of Trudeau's experiments, and because they have generally been overlooked in the published accounts of the protective inoculation of cattle, it is only just that they be recalled and be given the high place they deserve among the facts of this recent important addition to our knowledge of tuberculosis.

In this work, as in the building of the Sanitarium, Dr. Trudeau has found devoted friends, and has turned what appeared to be his misfortune into the most fruitful opportunities of advancing and broadening the scope of his activi-Dr. Osler's prophecy was fulfilled when the burning of his house was followed the day after by an offer to build a fireproof laboratory. A substantial stone building, with tiled floors and walls, lighted by electricity and furnished with every appliance for chemical and bacteriological work, has taken the place of the little room and has become one of three or four outlying posts of scientific investigation in this field. Dr. Trudeau collected about him a staff of able young physicians, equally devoted to him and to science, who worked with him and under his direction; and, in connection with the Sanitarium, has made Saranac Lake a center of special study in one of the most important departments in modern medical science. If the writer were giving a report of this work, the services and attainments of Dr. Edward R. Baldwin would call for special comment; they are known to the profession everywhere; but this brief sketch is a study of a great personality rather than an account of the development of a center of medical study and teaching. Four physicians and two assistants constitute the staff of the Laboratory, which has

been supported of late years by the generosity of Mrs. A. A. Anderson, a large-minded woman whose benefactions to higher education constitute an important part of the beautiful housing and of the endowment of Barnard College in New York. Dr. Trudeau has lived also to see the movement for the study and prevention of tuberculosis started, developed, and become National in its scope, and to be the first President of a society to further the great work and educate the public to a sense of its immense importance.

The establishment of the Sanitarium and of the Laboratory have been parts of the larger work of Dr. Trudeau as a physician. The little village of guides and a sawmill has grown to the dimensions of a town, and the health-seekers have increased from two in 1876 to seven or eight hundred. Drawn thither by the reputation and presence of the widely known expert and by the provision made for comfort and the facilities for treatment, Saranac Lake has become a great sanitarium; the inspiration, the center, and the example of the curative energy, the recuperative vitality of the out-of-door life. The "Journal of the Outdoor Life," well edited and charmingly housed at the Sanitarium, commenting on the occasional skepticism expressed touching the possibility of curing tuberculosis, reports that of a certain large number of patients discharged from the Sanitarium apparently cured, ninety-three per cent. of the "expected living" (according to a life table) are still alive; of those discharged with the disease arrested, sixty-five per cent.; and of the cases discharged with active symptoms, twenty-three per cent.

On the coldest day the streets of the village look like the deck of a steamer in mid-ocean, so continuous are the rows of reclining chairs. In that dry atmosphere the fear of fresh air, which survives from the times when Nature was a source of terror to men, and they hugged the fire in the great mediæval fireplaces as a refuge, not only from cold, but from demons, vanishes and leaves behind a new sense of liberty. The caller in Saranac is cordially wel-

comed on a hospitable piazza with the mercury ten degrees below zero, is given an extra rug, and recalls with a glow of present satisfaction the stuffiness of over-furnished and under-aired drawingrooms.

Never were invalids and semi-invalids more cheerful and buoyant. The whole community is pervaded by a quiet courage, an unpretentious and for the most part an unexpressed pluck, which cover the casual visitor with shame at the remembrance of his repinings over petty inconveniences.

At a time when the story of self-seeking and greed is writ large in the newspapers, and honorable reputations are shriveling in the fierce heat of a great indignation, it is in the last degree heartening to report a community in which mutual helpfulness and service, generous bestowal of great gifts of skill and experience, and indifference to the lower ambitions are pervasive and characteris-At first in loneliness and isolation and now with the companionship of expert physicians, Dr. Trudeau has ministered to hundreds of men and women who have gained strength from his strength and serenity from his courage. They have known that he has himself passed through all that they are passing through, and that he is not only an expert physician but an expert patient. Sorrows too great to be recorded, a support and faith too sacred to be commented upon, have been part of his personal life. They have given him a depth of sympathy, a quiet tenderness of touch on overborne spirits as well as on wasted bodies, a simple, unrepining, pervading strength, which have made him to a multitude of those who have been under his care, to a whole community which reveres and honors him, a living incarnation of the spirit of the Great Physician who suffered that he might heal and died that he might cure. Singleminded devotion, indifference to opportunities of "making money," self-forgetfulness, quenchless enthusiasm, and the habit of tireless observation and research, have made this semi-invalid the great figure he has become, and touched his career with a heroic quality and dignity.

Charles Ray Dean Secretary of the Delegation Edmund J. James

William I. Buchanan New York Chairman of the Delegation

Tulio Larrinaga Porto Rico

THE AMERICAN DELEGATES TO THE PAN-AMERICAN CONGRESS

N the development of America as a world power Dewey's gun at Manila, May 1, 1898, was a historic event. It is safe to assume that on or about July 21, 1906, another equally important event in that development will take place. On that date, it is expected, an American Secretary of State will, for the first time in history, officially visit South America, and the event will have a double significance because of the assembling at Rio de Janeiro, the capital of Brazil, of the third Pan-American Congress.

The leader of the American delegation to that Congress is, very appropriately, the Hon. William Inseo Buchanan, one of the most efficient agents ever sent by this Government to Central and South America. For six years Mr. Buchanan was Minister to the Argentine Republic. During that period he was designated by the Chilian and Argentine Governments, with the approval of the Congress of each country, as the deciding arbiter of the commission to fix the boundary between the two States. Mr. Buchanan. who had been in charge of an important department in the World's Fair at Chicago, became in 1901 Director-General of the Pan-American Exposition in Buffalo. The following year he was one of the delegates from this country to the second Pan-American Conference. The Conference met in the City of Mexico. Mr. Buchanan's latest service to his country was as the first United States Minister to the Republic of Panama.

Mr. Buchanan's colleagues are President Edmund J. James, of the University of Illinois, formerly Professor of Political Economy at the University of Pennsylvania, and Professor Leo S. Rowe, who now fills that chair at Philadelphia. Drs. James and Rowe are publicists of standing and will add weight to the commission. President James has given special attention to the subject of federal constitution: and city charters, as is indicated by the titles of his many publications. Five years ago Professor Rowe

was a member of the commission to revise and compile the laws of Porto Rico, and reported codes which were, with some modifications, adopted as the law under which the island is now governed. He is President of the American Academy of Political and Social Science.

Two other members bring to the work a special equipment by reason of work already accomplished in Spanish-speaking countries. They are, first, the Hon. James S. Harlan, a son of Associate Justice Harlan, of the Supreme Court; Mr. Harlan was Attorney-General of Porto Rico from 1901 to 1903. The second is Señor Tulio Larrinaga, Resident Commissioner in Congress from Porto Rico formerly Chief Engineer of Provincial Works, and a member of the Porto Rico House of Delegates.

The secretary of the delegation is to be Mr. Charles Ray Dean, at present Chief of the Bureau of Appointments in the Department of State. In the Venezuelan preferential treatment case before the Hague Tribunal Mr. Dean was secretary to the American Consul, and is familiar with South American customs and methods, both social and legal.

Such a personnel certainly ought to strengthen the t.es between the Washington Government and those south of They will certainly have well prepared the way for the Hon. Elihu Root, Secretary of State, who is prepared to reassert at Rio, and at the other South American capitals which he will visit in his circumnavigatory tour, the Monroe Doctrine in a way to assure to every Government in the Americas the respect and friendliness of our own Government. The interpretation of the Monroe Doctrine by a world-statesman like Mr. Root, in conferring personally with the ruling Powers of South America, ought not only to conduce to their own individual good but also to mark the advent of the United States Government to a beneficial social, commercial, and political influence throughout the Western Hemisphere.

MISS HELEN KELLER

HOW TO BE BLIND

Give the Blina a Chance to Become Self-Supporting, Self-Respecting Citizens

BY HELEN KELLER

THE New York Association for Promoting the Interests of the Blind lately held a great public meeting in New York City. Its object was to present a truthful account of the condition of the blind in America, who are now living in a state of idleness more terrible even than loss of sight, and to rouse the people to secure for these neglected thousands man's greatest privilege. opportunity to work. The blessings of a liberal education, equivalent to that provided for seeing children in common schools, are within the reach of all blind children in this country. But almost nothing has been done for industrial education, which is necessary to alleviate the tragic condition of blindness, and without which the benefits of other kinds of education are all but annulled. this moment thousands of strong, intelligent blind persons who could be trained as workers in the world of honest toil are enduring the keenest anguish because they are numbered among the unproductive dependent classes.

I am sincerely glad that our country is at last awaking to a realization of this condition. But at the same time I deplore the fact that this realization did not take place fifty years ago. For the problem is not one that began to-day or that can be solved in a day. It has called for solution ever since the first blind man faced the terrors of darkness. We had a champion and liberator half a century ago, but we failed to follow whither he so bravely led. Our leader was Dr. Samuel Gridley Howe, founder of the Perkins Institution for the Blind in South Boston, who brought the light of his genius into every corner of the cavern where the blind man dwells.

Constantly as he labored to instruct, by the best methods available, blind children and youths, he never forgot that in the nature of things blind girls and boys become adult blind, that most of the blind lose their sight in adult years, and he never ceased to plan and provide as far as he could for their wel-He opened a workshop for them connected with the Perkins Institution. He demonstrated their ability to earn and their skill to work. He even looked forward to the establishment of workshops large enough to receive all the sightless of New England who could be taught to work. At the end of five years he found that he had paid to twentyeight blind persons for the work of the fifth year nearly two thousand dollars, at a cost to the Institution of only three hundred dollars. Six vears later the amount paid in wages was forty-six hundred dollars. Ten years later, during war time, the amount decreased only a thousand dollars. Dr. Howe's reports outline for directors of schools wise, careful plans for the training and employment of those who are blind from childhood, and also for those who lose their sight in years of maturity. He was tireless in his efforts to open wider fields for their usefulness and self-help. What has the last half-century done to fulfill Are the blind in this his labors? country the self-supporting, self-respecting citizens that he prophesied?

According to the recent report of the Massachusetts Commission on the Adult Blind there are "some fifteen or twenty" blind persons employed in the workshop which Dr. Howe founded and which, under his supervision, half a century ago employed twenty-eight. It may be manifest to others, as it is to the Springfield "Republican," "what advantages this long-established institution . . . must have over any volunteer organization in

the matter of finding the right blind persons to employ, of directing their industry and marketing its product." These advantages certainly have not been fully

appreciated by those who enjoy them, for it was the "volunteer organization" referred to, the Massachusetts Association for Promoting the Interests of the Adult Blind, which took up the work of industrial education for the blind of Massachusetts about where Dr. Howe left it, secured the appointing of a commission by the Governor, and directly inspired the organization in New York of a similar volunteer association.

Three years ago, at one of the early meetings of the newly organized workers for the blind in Massachusetts, a blind man gave his experience. He had been foreman in a lithographing establishment. At the age of

thirty-six, young, vigorous, industrious, he had been stricken with blindness, and for four years he had groped his way from one kind of work to another and

had failed. He declared that he was eager to work, and craved no other boon in the world but work. "What can you do?" asked one of the investigators. "I do not know," he replied. "That is what I have been trying to find out." There was no one to advise him what he could profitably learn to do, much less a place where he could learn to do it. could not go into the little shop at South Boston. The only occupations outside it which seemed to have survived in Massachusetts as suitable for blind men were pianotuning, caning chairs, and selling pencils and

shoestrings on the street corners. It had been nobody's business to teach a blind man to work, to find him work after he had been taught, even to give him intelligent advice. Many important

things seem to be nobody's business. The agent of the commission which was afterward appointed to find out something officially about the blind, discovered in the State eighteen blind children of school age not in the Perkins Institution which the public had provided for them; it had been nobody's duty to see that they were educated. This has been the state of things a few miles from the scene of Dr. Howe's labors.

children, and enjoyed his recreation after the burden and toil of the day. With God's candle shining upon his head he has worked and thought and planned and faced the vicissitudes of life with his own help in him and a strong heart. In a moment all is changed. The terrors of a strange dark world close in upon him. He no more knows his way in the street, along the familiar road, even about his own house. He is as a cap-

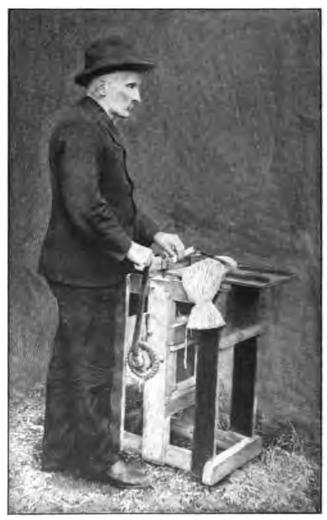

STRIPPING TOBACCO

This partially blind woman does the work practically as well as a seeing person. The manager of the factory says that her presence "calls out the humanitarian side of the others in her department"

Imagine, if you can, the feelings of a worker like that lithographer, stricken with blindness and cast out from the occupation to which he had been trained and in which he had risen to a position of competence. To him light and life have been synonymous. He has earned his bread in work which required his sight. He has known his family and his friends by the light that shines upon their faces. In the light he has read his newspaper, and walked abroad with his

tive, dependent on any one he may chance to stumble against, and if he has no relatives or friends, he becomes an object of charity along with the pauper and the degenerate. He flounders in a stagnant sea of apathy, without course or horizon or guiding star or haven. Or he grows bitter against a fate that he cannot master. The blind are brave, they try to be cheerful, but the "happy disposition" with which seeing people so often tell you the blind are endowed is a fiction more comforting to the seeing than to the sightless. With new hope the blind man hears that there are people who will teach him to read with his fingers. That is something; but it cannot lead him back to the active joy of work. Perhaps he visits the school for the blind in his State, with the hope that he may find something to do and something worth doing. He is speedily disappointed, for he learns that the blind children will be almost as helpless as he is when they graduate from school!

Great as the misfortune of blindness must always be, it has been much greater in this country than it need be. For the blind of Europe have advanced far through their limitations toward self-maintenance. The causes of failure in America are not far to seek: lack of initiative, intelligence, and enthusiasm on the part of those to whom the public has intrusted the welfare of the sightless, including the managers of the schools for the blind, whose attitude toward industrial ventures the Massachusetts Commission characterizes as "unsympathetic, to say the least." What we need, and what we have not, is expert supervision, adequate industrial training, some

agency to find positions for the capable blind, to stand behind them till they get a start, and to find a market for the work of their hands.

It is the policy of most American

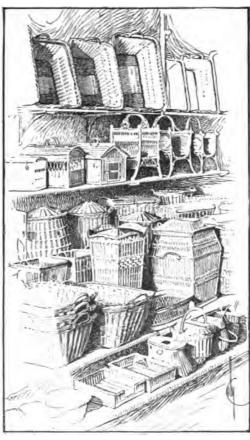

institutions for the seeing and the unseeing alike to let their graduates shift for themselves; to keep a record of their signal successes, but not of the failures. the blind such a policy is ruinous. A blind man cannot, like his seeing fellow-citizen, learn his work after his schooling is done, bear the brunt of learning it alone, and know the excellence of his work without the eyesight of another.

Suppose a young woman tries to knit and crochet in her home. She may work constantly, yet earn nothing. This is one of the kinds of work for the blind which can be

profitable only under careful supervision. Hand-made articles must be of the finest design, color, and workmanship in order to compete with the cheap machine-made articles, and only the well-to-do will pay

for them. Now, most of the blind are poor, and have but crude ideas of design, so that if their shawls and afghans are to fetch anything in the market, they must be done under the eye of a skillful teacher.

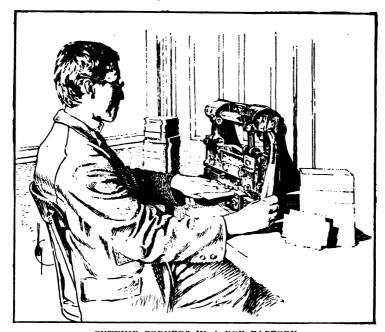

Even if a blind person can do something premely well, he cannot find a position for himself. Some sympathetic and intelligent agent is necessary to help him, not only to hunt a place, but to overcome a prejudice against Unfortunately, there is a presumption in the public mind that blind a man's work must be inferior to that of a seeing com-

THE WIDE VARIETY OF BASKETS MADE BY THE WISCONSIN WORKERS

petitor. The blind organist hears of a vacancy, goes to the church committee himself, applies for the position, and proves his musical powers. They refuse his services simply because he is blind. It is assumed that he cannot read new music, that he cannot teach others, that he cannot even be depended upon to get to church and find his seat at the organ. The deepest pitfall to the feet of the sightless is the black gulf of ignorance in the minds of the seeing. Modest, disappointed, abashed, the blind man does not argue his case. He needs a special

for the blind, instead of taking a minimum of interest in this work, ignoring it as outside their province, even openly or secretly opposing it, ought to be the leaders in all undertakings for the welfare of the blind. Does the real friend of a class, head of a respected and powerful institution specifically intended for a part of that class, bound his interests with the walls of his institution? A great educator like President Eliot understands that, if only for his own sake, if only for the welfare of his institution, he must concern himself with the entire

CUTTING CORNERS IN A BOX FACTORY

This blind boy works in a factory with seeing people, and does as good work as his companions

friend whose business it shall be to insist that people give the blind man a chance. What State in this country has long had any such authorized agent?

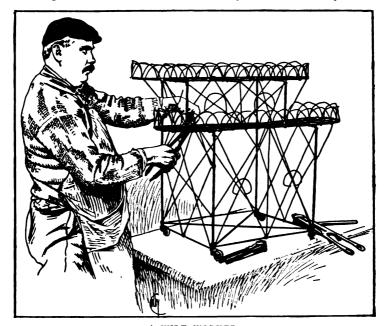

The existing schools for the blind are good as far as they go; there is little to censure in their instruction of children. They cannot do everything for all the blind, but they should feel that the problems of the blind are related, and they should be the first to encourage, inspire, and demand, with all the influence of their institutions behind them, the right kind of industrial aid for the sightless who need it. The directors of the schools

problem of which his special work is a part. We find him interested in a trade school across the world from his university, and laboring upon the curriculum of the lowest primary school. We quarrel with none of the excellent work for the blind which the existing schools are doing, but we say to the directors and trustees, "Encourage others to do for the blind what your excellent school is not intended to do for them. Do it all if you can and will, otherwise do not look with unfavorable eye upon efforts guided by other wisdom than that which emanates from you and your institution."

All these circumstances furnish a clue whereby to understand a great deal about the actual condition of the blind and explain the nature of the assistance that must be given to them at once. America, proud of being "progressive," has not learned the lessons which the practice of conservative European nations has mutely striven to teach us these many years. What the blind of America need, to open the door of usefulness and keep it open, is organized aid and intelligent encouragement. Europe affords good types of such organized aid for the blind.

When the graduate goes into the world as musician or weaver, an agent persuades the doubting employer to give the blind applicant a fair trial, and pledges his word for the candidate's ability. The blind man comes, surprises his judges by his skill and ease and freedom of movement, and conquers his fortune.

The results of the energy and good sense of these societies and agents are splendid. At the Glasgow Asylum for the Blind the average annual sales for three years were twenty-nine thousand

A WIRE WORKER

This man, after he became blind, was encouraged to continue his trade at home, which he has done successfully. His work is as good now as before he lost his sight

The "Saxon system" in Germany aids blind men and women in their homes, secures raw material at favorable rates, and markets their wares. The Valentine Haüy Association in France, and the associations connected with the institutions for the blind in Great Britain, find positions for capable blind persons and hold up their hands until their employers approve and accept their work. The schools co-operate. They strive to give their pupils a good industrial training and then pass them on to an agency that will turn that training to practical account by finding employment for it.

pounds, and for eighty years the workers have produced salable articles. Not only do the women make bedding for the institution, but they have secured contracts with shipping firms and other institutions. In London, which is declared behind the times but is far ahead of us, six per cent. of the blind are in workshops. In other English cities thirteen per cent. of the blind are employed. The chief industries open to them are many kinds of mat-weaving, a few kinds of carpentry, cordage, massage, brushmaking, mattress-making, and the manufacture of all kinds of baskets, from

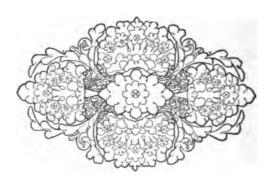

ornamental ones to heavy baskets used for bales, coal, and food. There is, moreover, a tea agency in London, the managers of which are wholly or partially blind. Hundreds of blind agents sell its teas, coffees, and cocoas all over England. Finally, eighty-five per cent. of the graduates of the Royal Normal College and Academy of Music for the Blind in London are self-supporting.

What shall we say when we contrast with this the report of the New York Commission for the Blind, which finds that only one per cent. of our sightless countrymen are in workshops? We have delayed all too long in our work for the adult blind, and the example of other countries is witness against us.

But already the States are roused. Better days for the blind are coming. Massachusetts, Connecticut, Maine, Pennsylvania, Michigan, Wisconsin, have turned from their darkness of ignorance, prejudice, and neglect, and have begun to help the blind to help themselves in the darkness from which there is no turning. As soon as the people know the needs of the blind all the States must answer in justice and generosity to a cry that is not for charity, but for rightful oppor-We must experiment carefully The little and then act with energy. experiment station which the Massachusetts Association opened two years ago has already shown what blind persons

can do. Here industries and processes are tested with a view to their fitness for blind workers. In a surprisingly short time the small group of blind people has acquired skill in making beautiful curtains, sofa-pillows, table-covers, and rugs, and the public has bought their work because it is beautiful. They also manufacture a mop invented by a blind man and made and sold by the blind. If the Association succeeds in keeping its title to the patent, this mop will go far toward giving the blind profitable occupation.

The general direction of the work of the Massachusetts Association is the right one for other States to follow in their first experiments. The effort is to find three kinds of remunerative workfirst, for those who cannot leave their homes; second, for those who can do best in workshops for the blind; and, third, for those who can learn some process in a factory for the seeing. people are ready to help if we show them the way. A prominent manufacturer in Massachusetts said that if it could be demonstrated that a blind man can work side by side with the seeing, the State should insist that a man losing his sight be trained to work in a factory near his home. No objection is feared on the part of seeing labor. There would be only one blind man to a thousand seeing workmen. And the human heart is kind.

GRATITUDE

BY HENRY VAN DYKE

Do you give thanks for this, or that?—No, God be thanked, I am not grateful

In that cold, calculating way, with blessings ranked As one, two, three, and four,—that would be hateful!

I only know that every day brings good above My poor deserving;

I only feel that on the road of life true Love Is leading me along and never swerving.

Whatever turn the path may take to left or right,

I think it follows

The tracing of a wiser hand, through dark and light, Across the hills and in the shady hollows.

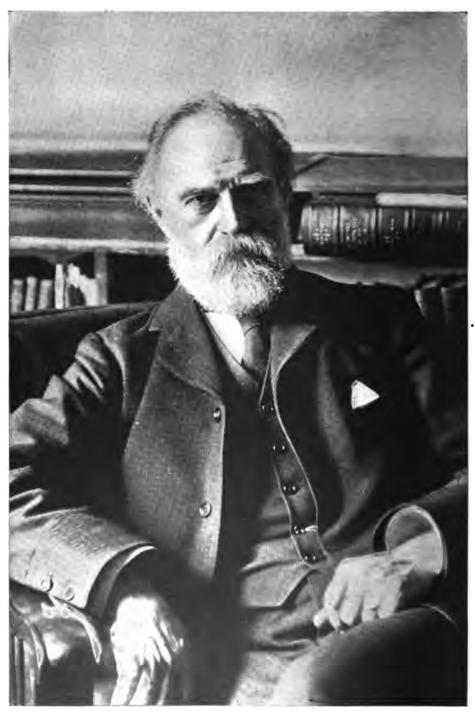

Whatever gifts the hours bestow, or great or small,

I would not measure

As worth a certain price in praise, but take them all And use them all, with simple, heartfelt pleasure.

For when we gladly eat our daily bread, we bless The hand that feeds us;

And when we walk along life's way in cheerfulness, Our very heart-beats praise the Love that leads us.

N. W. TCHAYKOVSKY

Photographed for The Outlook by Arthur Hewitt

THE RUSSIAN REVOLUTION-ARY MOVEMENT

BY N. W. TCHAYKOVSKY

The author of this article is sometimes called the "Father of the Russian Revolutionary Movement." He has been for over thirty years actively engaged in organization looking to political reconstruction in Russia. He was graduated at the St. Petersburg University in scientific courses in 1873, but during his final examination was interrupted and put under arrest, was detained in prison for several months, and there prepared the concluding papers of his examination. The fact that after such a detention no serious proofs were brought forward against Mr. Tchaykovsky illustrates the arbitrary methods employed against Russian students suspected of disaffection. Partly as a result of this persecution, Mr. Tchaykovsky took up his life-work of political agitation, spent several years of study in free countries, including a stay of four years in the United States, partly in the Russian colonies in Kansas and New York. In 1879 he returned to Europe to rejoin the active work of the Revolutionary party, and has since made his headquarters in England. While he has written articles and pamphlets bearing on the world's radical movements, the greater part of his time has been occupied in forwarding, as organizer and practical manager of societies, the cause of Russian political freedom. His experience of life covers a variety of professions, such as student of science, farmer, ship-carpenter, laborer in a sugar refinery, newspaper correspondent, editor of a technical periodical in Russian, teacher, manager of works, commercial agent, managing director of an industrial concern, consulting chemist, and writer He is now visiting this country once more.—THE EDITORS.

THEN the magic word "volia" (freedom) first swept the whole length and breadth of Russia in 1861, I was but ten years old. Living with my parents in their country estate in the northeastern part of Russia, I spent most of my playtime with the village boys, and learned very early to understand the joys and sorrows of the peasant life. I sympathized with them instinctively; their secret thoughts and aspirations were familiar to me. They actually believed at the time that the Czar, the "Little Father," was at heart on their side against nobles and chinovniks (officials), and no arguing could persuade them to the contrary.

With age and learning these early impressions of mine gathered into a consciousness of deep historic injustice to the peasants, a conviction that all privileged Russians must make reparation to the toilers of Russia. This feeling was very general among the youth of our generation. It formed a sort of philanthropic though quite sincere undercurrent for the reform movement of that time. The question of how this debt to the people could be most successfully re-

paid formed one of the standard problems and its solution a common mission of the decade 1860 to 1870.

The factors that caused this undercurrent to be transformed into a widespread craving for deep revolutionary upheaval later on were two: first, the reaction of the Court, headed by men like Muravieff, "The Hangman," and P. Shuvaloff, the arch spy; and, second, the tide of new republican and socialistic ideas flowing in from Europe. The former tended to paralyze all reforms of Alexander the Second, while the latter proved to us the futility of merely political liberal reforms granted from above and not obtained by sportaneous efforts of the people themselves.

This explains the fact that the first steps of men and women of our generation like Peter. Kropotkin or Katharine Breshkovskaia were invariably merely liberal attempts to help the toiling masses in their cultural development by starting private schools, spreading and reading among them useful booklets, assisting them in court in numerous disputes for land, procuring medical assistance, etc.

I was not an exception to this rule. I

started my public career as soon as I entered the University in Petersburg in 1868 as a member of the circle for organizing a private school for children, together with Sophie Perovskaia. But by the end of the same year the students' movement was started for obtaining corporation rights and privileges, and I was involved in it. The broader current of political ideas soon swept away the previous philanthropic thread of our views, and we began to think of the destiny of the whole Russian nation instead of our personal obligations to the poor and the oppressed. The necessity of forming an organized popular force for advancing the interest of the toiling masses became clear to us, and we decided to work for it. A group of five prominent students representing the three most important higher institutions in St. Petersburg the University, the Medical Academy, and the Technological Institute—was the result; and I represented the University. This was the group of initiative for recruiting and organizing all the revolutionary elements of our generation into an advanced guard of the future popular party on the basis of common political and ethical ideas.

At first the work was limited to the intellectual youth, but in the course of two years our organization grew so strong and spread so far throughout the country that it was decided in 1872 to transfer the main field of our action from students' lodgings in cities into the industrial suburbs of towns and into villages. This new work was carried on at first through individual connections and by forming small groups of factory workmen and peasants animated with the same ideas as ourselves.

The new gospel we announced was a "true volia." It included the communal possession of the whole land by the peasants, and our adherents were urged to gain their rights and liberties themselves by fighting instead of waiting till the Czar would order re-allotment of the land. This was the famous movement "back to the people," and our organization, to which my name was usually attached, occupied the central position in this agitation. So swiftly did it spread that in the report of Baron Palen, the Minister of Justice, in

1874, it was said there were signs of revolutionary propaganda in thirty-six provinces of European Russia, and the persecutions followed as a matter of course

The further evolution of this movement under the names of "Zemlia and Volia" (1877-79) and the "Narodnaja Volia" (1879-87) has been so admirably described by Mr. George Kennan, S. Stepniak, and recently by Prince Kropotkin in his memoirs, that I do not need to dwell upon it now. It is to be pointed out, however, that although this movement failed to involve in its ranks broad popular masses, and eventually was crushed in 1885 by the reactionary party, it accomplished an important historic mission. It destroyed the mystic faith in the "Little Father" in the breasts of the masses of people; it produced a splendid band of heroes and martyrs of the democratic cause; it created glorious revolutionary traditions for the future, and it outlined the platform of the democratic party in Russia.

A question probably will be asked why peasants and masses of workmen did not respond to the call of "Zemlia and Volia" (land and freedom), in 1877. This question has formed a disputed ground for the two last decades in Russia. Its answer can be given in the light of the recent events. mass of peasants at that time still continued hoping, against evident facts, for further reforms from the Czar. They actually believed the story invented by the reactionaries—that Alexander II.had been assassinated by nobles for having liberated the serfs. The only response which those revolutionary organizations received from below came from the town artisans and factory workmen, who formed several half-economic and halfpolitical organizations of some thousand members which formally joined the " Party of the People's Will." The author of the attempt of 1880 (Narodnaja Volia) to blow up the Emperor in his dining-hall in the Winter Palace was one of the leaders of such a purely workingmen organization (the Northern Union), a cabinet-maker by trade, S. Kholturine. Nevertheless, it has to be admitted now that the revolutionary wave which culminated in the "Party of the People's Will" has been mainly a movement of intellectuals followed merely by groups of town workmen and by only a few individual peasants.

Circumstances have entirely changed since that time. The revolutionary wave of the present day, although it covers all classes of the nation, is mainly based upon the movement of popular masses of workmen and peasants, who form the bulk of the democratic parties.

Therefore this part of the story requires our special attention. These men not only take active part in struggling for liberties and the new democratic order, but they evolve from themselves a new class of half-intellectuals, peasants and workmen, so-called "conscious workers," who undertake and very effectively do the part of the leaders of the masses. Although deficient in the rudiments of school education, they are well versed in all burning problems of the day, and can discuss and argue them from their point of view against any intellectual scholars; as a rule, they are well read in political and economic standard literature, and a special class of current literature sprang up in Russia within the last ten years to answer their mental needs.

When the Emperor Alexander III. went to Moscow to be crowned in 1883, he took particular care to receive the deputations of peasants from various provinces, in order that they should hear his personal declaration that no re-allotment of land whatsoever was to be expected, and that they should obey the heads of the nobles. This solemn declaration of the autocrat was almost equivalent to his abdication. It opened the eyes of the peasants, since they learned from the Czar himself what we had told them long ago-namely, that the Czar of Russia is but the wealthiest and the mightiest noble pomeschik (landlord), wno never could side with them in good earnest against his own class. Similar declarations, almost in the same words, were repeated by the present Emperor to the deputations of peasants when he visited Kursk for maneuvers a few years ago. This cold shower to the patriotic hearts of the peasants, together with

their own economic difficulties, accomplished the miracle. Peasants even of the remotest parts of Russia began thinking for themselves.

The misery of the Russian peasant is almost proverbial, and it has been ever growing since the emancipation of Their land allotments were insufficient enough at that time (1861), on an average of about seven acres per family. The population has doubled since, and the average allotment now is about three acres and a half per family. The productiveness of the land in the meantime has rather decreased than otherwise, owing to the reduced number of cattle in possession of the peasants and the natural exhaustion of the soil. No improvements in the methods of agriculture were possible, owing partly to the want of capital and partly to the deficiency of education, which was systematically denied to them. The only way open for the peasant out of this situation was either to look for a job at the factory gate or to rent more land at an exorbitant rental from the neighboring pomeschiks. He actually tried both, but to no purpose, for the market prices were against him. grain which he produced had to be sold for ready money as soon as it was gathered in order to pay the taxes—and that at prices which grew lower and lower every year, probably owing to American competition. On the other hand, all goods that he had to buy for ready moneysalt, petroleum, iron tools and implements, calico prints, tobacco, and winewere more and more heavily taxed and therefore grew in prices. The two ends of the millions of toilers, that is to say, their earnings and expense, ran farther and farther from each other, to their infinite perplexity and dismay. They growled under the burden, but could not comprehend the causes, "as it was known to everybody from olden times that the market prices are God-made." there was a period, indeed, when our people were on the brink of despair.

Now there comes a clever intellectual who puts into the peasants' hands a concise little booklet which explains everything. It says that market prices are not God but Czar's-Minister made; that there are such things as indirect taxes

and protective duties on articles of popular consumption, which make prices rise as obediently as water in a pump underpressure; that these taxes and duties are made high by the Government of the Czar in order to suit the convenience of the privileged people, such as rich manufacturers and Czar's highly paid officials; that the Government increased the yearly budget of the State for the last ten years from one billion rubles to two and a half billion rubles, and that almost all this enormous heap of money was obtained from the peasant class by means of an artificial rise in the prices by means of indirect taxes and tariffs, since it was impossible to fleece and flog out of the people any more direct taxes (they were 120 per cent. in arrears in 1902) than were already demanded.

This was quite a revelation to the peasants. The booklet went from village to village, was read and discussed at hundreds of private meetings, until it was torn in pieces. Then the readers asked their town friends to send them some more of those precious booklets. Their desire being readily gratified, they further learned that they will never get out of their difficulties and misery unless they have a voice in the matter of prices and taxes through an elected assembly of deputies from all classes, including themselves, and in equal proportion; that they ought to have all officials to be elected and controlled by themselves instead of being appointed by the Czar, as at present; moreover, that they will never be able to elect the right men or control them effectively until the people have liberty of press and speech, liberty of meetings and unions, in addition to the liberty of faith, and that these ought to be guaranteed to them by handing over the land and the control of the budget to the people.

This completed the course of political education of the peasants. They formed, in the course of the last eighteen months, local branches of the Peasant Union, and the ties of friendship between the village toilers and the advanced intellectuals were drawn closer; they concluded an alliance against the whole autocratic bureaucracy and their system of self-aggrandisement and tyranny, and became

parts of the new-born conscious democratic force of the country.

As to the younger brothers of the peasants who went to town to look for jobs, they learned the truth still quicker. As soon as they commenced working they found that there was quite a net of fines and tricks in the factory system, enabling the foreman to exact extra profit from the men. But as soon as the men grumbled and began to discuss the situation, and especially when they declared a strike, they were threatened by the factory police, by the factory inspectors, and, last but not least, by sotnia of Cossacks. In this way they found by bitter experience that the price of their labor was, after all, kept down by the Czar's agents, and that in order to improve their position they ought to change all that; they ought to have liberty of meetings and of strikes, liberty of speech and press, and, above all, liberty of forming unions; and that all these privileges ought to be guaranteed to them by a constituent assembly elected upon equal, direct, and universal suffrage. Consequently they joined the union of their trade, the purpose of which was to get not only improved conditions of labor, but also the rights and liberties of the people. They elected representatives to the council of the workmen's delegates and took enthusiastic part in the political demonstrations and public meetings on Sundays, held in spite of the prohibition of the police. There they heard from their leaders that nothing short of the general political strike could settle their claims; and they believed it. This completed the course of political education of the factory hands, and completed their alliance with the intellectuals who opened their eyes. Next they wrote home to their village relatives that they had joined the union, and learned from them in reply that they had done the same. Now they were parts of the huge national organization which they believed could accomplish miracles and was sure to obtain them liberties, rights, and land, above all.

The year 1905 was the year when such a course of political education was actually completed by many millions of Russian toilers. The "Bloody Sunday,"

when Father Gapon said that the "last link between the Czar and the mass of the workers had been broken," was merely the last straw that broke the back of the camel. Sympathetic strikes and demonstrations in all parts of Russia, involving millions of people, followed. All attempts of the Government at suppressing them acted like oil poured upon fire, and enhanced the enthusiasm. But the practical outcome of all this gigantic commotion was the formation of thousands of unions of all trades and professions, with branches in the provinces. They sprang up all over Russia, met in local conferences, passed resolutions demanding liberties, convocation of the constituent assembly on the basis of universal suffrage and granting the land to the people, besides general improvement in conditions of work. These local organizations sent delegates to the national conference, who formed national unions, and finally these national unions federated into a Union of Unions. The whole federation covered from seven to ten millions of people, including the peasant union (up to three million members) and the railway employees' union (about eight hundred thousand men). Delegates of this most important organization, together with the representatives of local organizations of the capitals and the representatives of the advanced political parties, formed what was called the Councils of Workmen Delegates in St. Petersburg and Moscow, which practically ruled the situation. It comprised 320 delegates, representing 170,000 workmen in St. Petersburg alone.

It would not be right to say that the democratic and republican force covered workmen and peasants alone. Professional unions, as those of doctors, lawyers, engineers, writers, artists, etc., played an important part by placing their knowledge at the disposal of the organi-They withstood the hardships of the struggle side by side with wage-They stopped work when the general political strike was proclaimed, and very often lost their positions after the strike ended. They were arrested for attending committees and public meetings, and speaking at them; some of them attended sick and wounded under the fire of the Government machine guns, and were afterwards shot for doing their duty. Lawyers attended to the legal business of the unions, defended the persecuted members of the advanced parties and of the unions, and looked after the interests of the amnestied comrades, doing all these things of course free of any charges.

These are the elements upon which the present republican and democratic movement in Russia is based. No wonder that these men showed such splendid pluck at the critical moment. They are the pick of the nation. In Moscow they withstood the artillery fire for eleven days. Trains full of railway men came to the town every morning to do their risky duty and used to return home for the night.

There is another question which I may expect from the reader. Are Russian peasants and workmen ripe enough to participate in republican self-government? This I am bound to answer in the affirmative. Russian peasants as a class have not lost the habit of taking active part in the management of their own communal affairs, in spite of all the moralizing efforts of the local autocrats (Zemskie Natchalniki) appointed since Moreover, the new class of halfintellectual peasants alluded to above forms a very effective body of men to guide and protect their interests. as to the want of elementary education and the illiteracy of peasants (who form about fifty per cent. in the central part of Russia), their craving for education is so strong that the greatest probability is that under favorable circumstances they would soon overtake other classes in this respect.

What was the reply of the Czar's government to all these splendid manifestations of the young vigor and constructive strength in the nation? Brutal oppression and promises which it never meant to carry out. Not even an attempt to grasp the needs of the nation as a whole and to satisfy them. Is such a government worthy of another chance to try its skill? It ought to go; and the sooner the better.

A MOTIF FOR AN AUTUMN ROMANCE

BY EMERY POTTLE

T ten o'clock Bartlett conducted Mr. Hatch to the park-an unvarying event on fine mornings. It was late October, and the day was bland with sun. The slight depression incident to the falling, sear leaf and the wane of the season became in the brilliant warmth of the morning hardly more than a motive of gentle retrospect, an agreeably modulated memory of the past. Even Mr. Hatch, keyed to a mood of more than usual petulance, had to admit—as he trotted crossly through the Seventy-second Street entrance, Bartlett properly behind him with a rug—that he'd seen worse weather, though all days in the city were makeshifts.

Mr. Hatch made for the center of the park. Presently, casting about with his little, sharp, gleaming eyes, he drew a gloved hand from his pocket, and, pointing, said, with a mixture of deference and imperiousness, "I'll sit over there on that bench, I guess, Mr.—or—Bartlett."

"Very good, sir."

The footman tucked the rug carefully about the knees of the old man, and then stood impassively back of the bench. Mr. Hatch endured this polite espionage for several minutes, fidgeting in his seat and growing inwardly more irritable.

"Go away," he exploded at last, fretfully, "and walk around—walk way off.

I'll sit here."

"Yes, sir; and when shall I come back for you, sir?"

Mr. Hatch smothered a mild curse.

"Beg pardon, sir?"

"An hour, I guess—an hour! That's about all I can stand of anything," the old man snapped.

"Very good, sir."

Mr. Hatch watched him woodenly depart, with a frown of extreme displeasure on his wrinkled forehead.

"It ain't decent," he muttered, "wearing monkey clothes like that and being

called by your last name. Seem's if a man ain't got any notion of the Constitution or his freeborn rights, to be shilly-shallying around at anybody's beck and call like those fellows do. 'Very good, sir!' Puh! If he'd get out on a farm and do a day's haying! He reminds me of old Sam Ward's idiot boy—he was always standing about, saying nothing, dumb as a pump. They ain't no company to a man, these chumps."

Furtively Mr. Hatch jerked the kid gloves from his knotted hands. He stared at them contemptuously. "Kid gloves! And in October! My Lord! Mittens are good enough for me—when it's cold." He unbuttoned his topcoat, taking occasion to rub the silk lining between his thumb and his forefinger. "Good goods," he grudged. "Must have cost George an awful lot of money. No warmth to it, though. I'd rather have my old brown overcoat than two of these."

He gazed about him critically. "It's the best they can do, I s'pose—nice walks and trees—but they don't seem real. But I can stand it here better than being cooped up in them! He waved his cane indignantly toward the row of imposing stone apartment-houses rearing their handsome heads above the splendid mass of autumn reds and yellows—arrogant mansions confident of their expensiveness.

"Receiving vaults," he sniffed. "And they call 'em houses—no upstairs and no downstairs! Can't see how they stand it in 'em. Don't seem's if I could stand it in George's house. 'Twenty-five foot front'! My Lord, our old house was—" The irascible old gentleman lapsed into a monotone of gloomy, scornful phrases.

Gradually the benignant sun and the placidity of the gracious park began to soothe Mr. Hatch even against his will. He settled more comfortably upon his

bench and let his eyes stray tolerantly over the green lawns and brilliant trees. His mind, indeed, wandered out across the pleasant expanse, beyond the troublesome confines of the city, far into a cleaner, greener land.

"Everything's harvested at home," he mused, lonesomely, " and the boys must be gethering the hickory-nuts and the walnuts on the farm. Everything's harvested but-me. I'll bet 'twas a fine morning home—one of them crisp, sparkled kind of mornings, sort of frosty on the grass and a frisky feeling in the air. I'd hitched up and gone into the village by this time, to get the paper. Seem 's if I got more news out of that paper! These here they have are so big, and fancy, and such liars I can't seem to find out much from 'em except about the divorces. I'll warrant Drummer 'd kick up his heels to-day a littlepshaw! getting too old to drive colts, am I? I could show 'em. I wonder if they'll paint the barns this fall? They need it. My Lord! 'twas twenty-five years ago I put 'em up! Everything is I'm old, too. The women I knew are old or dead. Everything is old but this place!"

Mr Hatch roused himself with a little shiver, and moved into a greater warmth of sun. He looked about him with renewed belligerence. "But this place!" he reiterated, pettishly. "Hullo! there comes that old woman again." He sat up more stiffly, and watched a tiny, delicate old lady slowly moving toward him along the walk. He was vaguely aware that she was expensively gowned, that the furs she wore—even on so warm a day—were very costly. There was a maid with her, a pretty, foreign creature, with a pert air of disdainful service.

"I'll bet that girl don't give a hoot for the old woman," considered Mr. Hatch, with interest, "no more than that Bartlett does for me. Somehow she don't seem city-bred, the old girl, for all her fine clothes. Wonder if she'll sit here like she did yesterday."

Indeed, at that moment the little, fashionably dressed old woman was saying, with a delightful air of importance, "I'll sit right down here, Maree."

"Yes, madame;" and the maid rather

contemptuously folded the rug about her knees.

"You can walk around, Maree. I guess I'll sit here about an hour. You can come back then."

"Thank you, madame, yes." She tripped neatly away.

The little lady fluttered her wings and settled her plumage prettily, with an obvious delight.

"Just like a canary," considered Mr. Hatch.

Presently she glanced curiously at the old man on the next bench. Certainly he was a most respectable old man; his broadcloth was dignity itself, she thought, as he sat in the rigidity of perfect propriety. "A nice-looking old man, but quite feeble, I should think. I shouldn't wonder if he came from the country—somehow he reminds me of—of—dear me, so long ago!" She patted her furs caressingly. Her movement of hands and head was most alert; indeed, her whole body, despite its undeniable age, was vibrant with youthful pride and satisfaction.

The two continued to steal furtive glances at each other. Mr. Hatch coughed suggestively. His neighbor conspicuously arranged her white-gloved hands outside her rug.

They sat silent and decorous. A fat, bold squirrel coquetted lightly toward them. Mr. Hatch, with an involuntary look of pleasure, began to toss the animal nuts which he drew from his pocket. So absorbed did he become in his pastime that he was quite startled to find himself saying to his companion: "Tame, ain't he?"

"Yes—oh yes," she answered, almost unconsciously. "I'm used to the red ones, though."

Mr. Hatch threw out the last nut. He straightened up slowly and regarded the little lady with a franker manner. "I guessed you were from the country when I saw you," he said, simply.

She flushed uncomfortably. "I'm sure I—" she began, distantly.

"No offense, ma'am, and it was not from your clothes," said Mr. Hatch, hastily but diplomatically.

She smiled with ill-concealed pleasure. "Well, how—?"

"Oh, I don't know," he replied, vaguely.
"I just sort of knew."

"I guessed the same of you," she hazarded in a twitter of a voice.

"No! Did you, now? Well, I'm glad to hear you say that—I've been kept dressed up so for the last year, I didn't know, but—and you guessed?"

She nodded.

"Old dogs."

"New tricks?" she queried.

"You've hit it," he chuckled.

She pursed her lips and smoothed her gown admiringly. "I don't know," she asserted, "about that."

"I know about me," he declared, irritably. "Have you been here long,

ma'am? Do you live here?"

She hesitated, but her desire to talk was too strong for personal ideas of decorum. "Not so very long—last spring, and we were away for the summer—and this fall. I live over there in Central Park West."

Mr. Hatch shoved nearer on the bench. "Do you like it here," he asked, confidentially, "in these human warehouses?"

"Where?" she asked, blankly.

"Flats, then? Apartments? Whatever you call 'em?"

"Oh, yes-very much."

Mr. Hatch stared. "You said you were country-raised?"

She laughed outright. "I don't know as I did. But—I was."

"And you like those houses—and this great, big, bellowing city?" He was quite incredulous.

"Yes, I⁻do. It seems to me that for the first time in my life I am actually—" she broke off confusedly.

" What?"

"Living like folks. Seeing things," she completed, defiantly.

"My Lord!" groaned her neighbor.

She sat up very primly, pulling her furs closer about her neck. Mr. Hatch

eved her despondently.

"To me," he continued, gruffly, after a long silence, "it's just like the circus. When I was a boy I used to like the circus. Start off and make a day of it—peanuts, pink lemonade, the whole thing!—if I could run away from the farm. And, great guns! wasn't I tired

when night come? Well, I've outgrown the circus. But I have to go to it—night and day—now. And I'm tired—tired clean through." He sighed laboriously.

The old lady regarded him with compassion. "I wasn't allowed to go to the circus when I was a girl," she smiled.

Mr. Hatch completed the analogy. "And now you're going it to make up for lost time?" he snorted.

She decided not to take offense. "Well, if you call it that. I—I like it."

"I never understood women," remarked Mr. Hatch, with a pious note of self-congratulation.

She replied with some asperity. "I s'pose you were like most men, so busy telling women about yourself you didn't have time to understand 'em."

Mr. Hatch grinned good-naturedly. "I guess you got me there. But I always say they's two times when you don't understand a woman. Before you're married—and after." He chuckled over his little joke until he coughed alarmingly. His companion took it all with a polite smile.

"Some one said that to me once before," she said, abstractedly. "I was trying to think—when I was a young lady—"

"Now that's queer. Your previous remark sounded mighty familiar."

They laughed happily over the encounter. After this the ice was rather more broken.

"Do you live here all alone?" he asked, curiously.

"Oh my no! I live with my married daughter."

"I live with my married son."

They edged closer to each other, quite unconsciously.

"I s'pose—" he essayed, hesitatingly
—" they—you—you said you liked it—"

She was quick to catch his meaning, and drew herself up with proud satisfaction. "You mean—do they treat me well? Why, Harriet—"

"Your girl's named Harriet?"

She nodded. "Harriet can't do enough for me. And her husband—he's something big on Wall Street—why, he—he —he calls me *mother*. He says I'm just the same as— His mother died, you know, when he was a baby. And I

never had a son. Oh, I never thought it would be like this—it's just heaven!"

She looked at her companion with sympathetic, questioning eyes. He interpreted, shrewdly. "Oh, no, nothing like that." She started guiltily. "You probably think that because I—I kind of act discontented, that my boy George — Don't you believe it. That boy'd give his last cent to make it comfortable for me. He's the best boy a man ever had. I say so. Look at these clothes—George got 'em. Wanted to get me a vally, too, but I kicked. And Caroline, George's wife, that girl's doing for me all the time. They don't imagine I don't care for it here."

"I'm real glad," she murmured. "I was afraid—"

"Nothing for it but I must come and live with 'em," he continued, with justice, though with a touch of sarcasm. "Been at me for ten years. Ever since my wife died. And then last year my daughter got married, and that left me alone in the house. I had to come then. They said I was too old to stay alone! Too old! I ain't but sixty-nine. I could have stayed alone. I could do a day's work with any of 'em," he scolded. "But George is a good boy, though; I shouldn't want him to know I want to get home."

The little lady was deeply interested. "I guess he is a good boy from what you say. I thank the Lord every day for the good boys and girls in this world. Oh, there are some children that—it just makes my heart ache to think of their fathers and mothers. I just come last spring to Harriet. I was living alone, except for the shiftlessest fellow and his wife who lived on the place. And do you know, it was the funniest thing," she leaned toward him confidentially. "I don't know why I should be telling you," she hesitated, shyly.

"Go on, ma'am. I guess we're two birds of a feather."

"Well, do you know," she went on eagerly, "they'd been wanting me to come and live with them ever so long, but they wouldn't ask me because they thought I'd be unhappy in the city!" She laughed delightedly over the absurdity of the idea.

"Sensible folks, I should say," grunted Mr. Hatch.

She disregarded this. "And they are so pleased now that I'm here and like it, and so afraid that I'll not stay contented. Honestly, it seems sort of wicked when I look at the things that Harriet and Robert have given me. Dear me, I try to think of the suffering poor in the world that need so much, but—I'm dreadful, I guess-but somehow I don't seem to care. I'm just glad for myself." With a charming ingenuousness she drew off her glove. On a trembling, wrinkled finger, the joints swollen with rheumatism, gleamed a splendid ring of diamonds. "Robert gave me that this morning-it's my birthday. Isn't it beautiful? I've dreamed nights of having a diamond ring."

Mr. Hatch was fumbling at his cravat. "It's a fine one," he commented, "but just look at this that George gave me." With thinly assumed indifference he ex

tracted a shimmering opal pin.

"It's lovely," she breathed admiringly.
"I don't care much for such gimcracks," said Mr. Hatch, sternly, replacing the pin with great pains.

For some moments they sat, quite in silence, basking like aged cats in the

grateful sunshine.

"You can talk about your diamonds," broke out Mr. Hatch, argumentatively, but, ma'am, on a morning like this the diamonds that'd please me are the frost-diamonds in the grass out in God's country. Where it shines and sparkles. And it's crisp and—can't you see it, ma'am?"

"I can," she replied, tartly. "I've seen it for—for a good many years. I don't ever want to see it again. There was a board right by my back steps—I'll warrant I fell down on that old thing forty times—frosty mornings."

"I can smell the fine air of the early day," rhapsodized Mr. Hatch. "Good,

good!"

"So can I. For forty years I got up at daylight—cold, nasty, horrid daylight—and lighted a lamp to see my way around to work. Till my husband died there were fourteen cows to look after. I can't hardly eat butter now, thinking of it."

"I'd had the morning's work done by slightingly, now," sighed Mr. Hatch. bury."

"I wouldn't," she replied, acidly. "I never had it done. I worked day and night. Look at those fingers! And saved and saved, and worked and worked. And they was always more to do. I used to pray God nights to let me get rested—just for one little hour."

"That was living then," he chanted, obliviously. "Work is good for folks. It keeps 'em healthy. You never heard of nervous prostration and—and grippe—and appendixes when I was a boy. But here! Hah! They're having diseases you never knew flesh was heir to. They ought to get out and work. O my Lord, I wish I was back plowing the ten-acre back lot!"

She flashed at him impetuously. "Work! You say you never heard of diseases and grippes and things when we were young? Good reason—they wasn't time to have a disease comfortably and give it a name. Women worked till they dropped in their tracks and went off in corners and died. And the men, too. Work! I never want to see a farm again, or a cow. When I was a girl, I hated it. I said if I ever married, I'd marry a man who'd take me to the city; but I didn't. I married one-of you. He was a good man, too, but I don't know as I wish him back." She sat back breathless in her defiance. "But, thank God, I saved my daughter from it—from the country !"

"Women ain't never satisfied," Mr. Hatch growled, impatiently.

"I don't see that that's any argument. I'm satisfied now."

"Most women are fools," characterized Mr. Hatch, loftily.

"They're men's fools," snapped the little lady. "You leave 'em alone and they are all right."

The attack was growing too hot for Mr. Hatch to combat. He retreated shamelessly. "What part of the country did you come from, ma'am?" he asked, with great consideration.

"Ohio," she responded, briefly.

"Nice country. I've been there," said he.

"Horrid! I wasn't born there, I'm glad to say," his companion remarked,

slightingly. "I was born in Shrewsbury."

"Shrewsbury? New York?" cried Mr. Hatch, excitedly.

"Yes."

"Why, why, I come from there—that's where I live—where I used to live," he finished, gloomily. "And you came from there?"

She leaned toward him, scanning his face earnestly. "What—what is your name?" she demanded, eagerly.

"Hatch, ma'am. Ever heard of it?"
Her cheeks were quite pink and her eyes twinkled with fun. She was a very pretty old lady at that moment.

"Yes, it seems to me I've heard the name—somewhere. Salem?—Don't you know me?—Hattie? Hattie Mills?"

He stared straight into her smiling eyes. "Well, my Lord!" he ejaculated, solemnly. "Why didn't I guess it before? Harriet Mills—Hattie! My Lord!"

"Salem Hatch!"

She took his outstretched hand.

"Well, Hattie?"

"Well, Salem?"

"I kind of thought that conversation of ours sounded familiar," he said, slowly, reminiscently.

She drooped her head. "You mean—"
He laughed gruffly. "Yes, that's
just what I mean. Remember the night
I drove you home from camp-meeting?"
She nodded gravely.

"We talked it all out that night. I was in—love with you then, Hattie. I was going to ask you to marry me right there, but—"

"I always wondered if you were," she laughed softly. "And 'twas so long ago. Think of knowing now that you—"

"'Twas that talk of yours about hating the country that—"

She smiled a little sadly. "I know. I said it because—oh, I meant it, Salem."

"While we're talking, Hattie, did you—ah—sort of—eh? For me?"

She blushed. "I guess I—did, to tell the truth. But my folks moved to Ohio, and—and—oh, I married like the rest—a farmer. And you married, too."

a farmer. And you married, too."
"Sarah Winters—you'll remember
her?—a good girl, God rest her!"

Both sat busy with their own strange,

wandering thoughts. Presently Mr. Hatch straightened up with a laugh.

"And, after all, us two old birds turned up here in New York! Beats all! You, just the same, liking it, and me, kicking, same as ever." He patted her hand affectionately.

"Little Hattie Mills," he mused. "You were the prettiest of 'em all, Hattie."

"You were always fooling, Salem," she bridled.

"Honest, Hattie, you were."

They dropped childishly into the ancient gossip of their bygone day. The eyes of the two shone eagerly, and the years lay lightly on their snowy heads.

At last—"And you wouldn't want to go back again, Hattie?" he asked, wistfully. She smiled tremulously and perhaps a little piteously. "No—no, Salem. Never,

I'm afraid. I—I've got my heart's desire."

He shook his head soberly.

"My, how the time has gone! It's time for my maid to come," she said, consciously.

Mr. Hatch rose painfully. "I get so stiff on these benches," he explained. "There she is, up there, and there's that dam—excuse me, ma'am—that man of mine with her. What do you think of that?" He waved his cane violently.

"There they come," he said, morosely,

"the good-for-nothings. Following us around all the time as if we were babies."

"Maree's real handy," faltered the little lady; "but sometimes, Salem, honestly, I'm kind of 'fraid of her."

"Don't take any slack from her," encouraged the old man, stoutly. "Yes, you can take the rug, Mr. Bartlett. I'm ready," he muttered meekly in the next breath.

"I'll come along with you, Hattie." The two ambled happily together toward the entrance, the servants sedately in the rear.

"It's been a beautiful birthday party, Salem," she smiled.

"I'll be here to-morrow if it don't rain, Hattie," Mr. Hatch said, anxiously. "If you—"

She reddened consciously. "I—I'll come," she murmured.

"I'm real glad—" he essayed, as they emerged into the busy street.

"So am I, Salem. Good-by."

The old man trotted after her eagerly. "I forgot to ask your name now, Hattie. I—I—I s'pose I'd ought to know."

She fluttered to him. "Of course—and where I live, too." They lingered together again gratefully.

"Ain't they the two old jays?" conveyed Bartlett out of the corner of his mouth to Marie.

Comment on Current Books

Among the more notable books New Books of the last week or two may be named the first volume, superbly printed, of "Mediæval London: Historical and Social," in the great "Survey" planned by the late Sir Walter Besant (Macmillan); Professor Friedrich Paulsen's "The German Universities" (Scribners); "Lincoln, Master of Men," by Alonzo Rothschild (Houghton, Mifflin & Co.); "Bird and Bough," by John Burroughs (Houghton, Mifflin & Co.); Thomas F. Millard's "The New Far East" (Scribners); and, in fiction, Agnes and Egerton Castle's charming romance, "If Youth but Knew" (Macmillan), Mr. Rex E. Beach's vigorous tale "The Spoilers," and Mr. Owen Wister's "Lady Baltimore," a book as different as possible from Mr. Wister's earlier stories, but of a singular interest.

Braj: The Vaishnava Certain apostles of Hinduism have at-Holy Land tracted a sympathetic hearing and some disciples in Western countries. The other side of the shield is exposed in this volume by the Rev. Dr. J. E. Scott, a missionary. The chief seat of the cult of Krishna, adored as the incarnation of Vishnu, the second member of the Hindu trinity, is the city of Mathura in northern India, the center of the region here styled the "holy land," the Sebastopol of a gross superstition. Here the Methodist Church in 1888 established a mission led by Dr. Scott, which now reckons a Christian community of ten thousand. As introductory to the story of this enterprise, the "holy land," its towns, its religious sects, their beliefs and practices, are described at length, and particularly the character of the reigning deity,

Krishna. His interest for us comes from the frequent analogies drawn between him and Christ. He is, indeed, the most joyous and human personage in the Hindu pantheon. But, as here described by indubitable testimony, he is the deity of rakes and lust. (Braj: The Vaishnava Holy Land. By Rev. J. E. Scott, Ph.D., S.T.D. Eaton & Mains, New York. \$1, net.)

This is such a delightful The Château of bit of comedy that Miss Montplaisir Seawell should be proud of her ability to bring smiles to the generally downcast countenances of ordinary readers of fiction. Pure merriment, absurd combinations, del cious impertinence, sparkle throughout these pages. The atmosphere is that of French gayety, and the effect is most refreshing. A group of persons including an impecunious youth of good family, his unattainable lady-love, her frisky old aunt, an ambitious and rich soap-boiler, two or three "semi-royal" dukes and generals, and one or two eminently proper individuals, make merry together in the château of Montplaisir. (The Château of Montplaisir. By Molly Elliot Seawell. D. Appleton & Co., New York. \$1.25.)

Congregationalists "Who They Are, and What They Do," their origin, history, institutions, distinguished leaders, and other matters of common interest and frequent inquiry for information, are here stated in the compact and luminous form of question and answer by the Rev. Theodore P. Prudden, of West Newton, Massachusetts. He has made a comprehensive and convenient book of reference and instruction. (Congregationalists: Who They Are and What They Do. By Theodore P. Prudden. The Pilgrim Press, Boston. 40c.)

George Barr McCutcheon has somewhat too heavy a hand for his slight material. Comedy requires a light, graceful touch that is but rarely found among writers of this sort of romance. The drunken men are too drunk, and the vixenish women are too malicious, and the gay girls are too merry for truly artistic effects. (Cowara'ce Court. By George Barr McCutcheon. Dodd, Mead & Co., New York. \$1.25.)

The First
County Park System
County in New Jersey. The work was begun ten years ago, and a considerable part of it is already completed. The credit for the first plan of the system and for much of the energy and initiative which resulted in

the launching of the enterprise is due to Mr. Frederick W. Kelsey, who in this volume has written the history of the movement. The discredit for the marring of the original plan by the seizure for traction purposes of streets necessary to its completeness and homogeneity rests with the Public Service Corporation and its tools in town and county governments. Mr. Kelsey describes with vigor and frankness the progress and the obstruction of the project during his vicepresidency of the Park Commission and afterwards. He makes valuable comments on the subject of park systems in general and wise suggestions to communities interested in securing breathing-spaces for their people. (The First County Park System. By Frederick W. Kelsey. The J. S. Ogilvie Publishing Company, New York. \$1.25.)

The Financier A crude story dealing with the great financial operations and international complications involved in the exploitation of a newly opened up section of Africa. (The Financier. By Harris Burland. G. W. Dillingham & Co., New York. \$1.50.)

Another Life of "Old Hickory"

It is not a difficult matter to write a biography by compiling it from biographies already in existence, and, for good measure, throwing in generous citations from other writings touching on the subject in hand. But it is hardly to be expected that the resultant production will bear the stamp of originality, or otherwise disclose warrant for existence. And for this reason, if for no other, it is impossible to regard favorably "The True Andrew Jackson," written by the Rev. Cyrus Townsend Brady for the series which already includes "True" biographies of Washington, Franklin, Jefferson, Penn, Clay, and Lincoln. Mr. Brady is an indefatigable worker and a facile writer, but in the present instance he has certainly failed to equip himself for what is a most difficult task -the adequate and discriminating presentation of one of the strongest characters this country has ever produced. For both facts and conclusions he seems to rely chiefly on Parton, Buell, Sumner, Brown, and Colyar, excerpts from whose writings make up no small proportion of his book of over five hundred pages. Where he does display originality-as in the closing chapter on "Jackson's Place in Our History"—he is usually happy, which must only increase the regret that he has not shown more independence. His work is further open to objection as ill-proportioned, abounding in extreme statements, and uncritical-defects which quite outweigh the considerations that

it is vivacious, rich in anecdote, and thoroughly readable. (The True Andrew Jackson. By Cyrus Townsend Brady. J. B. Lippincott Company, Philadelphia. \$2, net.)

A great writer has Memories of a drawn a distinction be-Great Schoolmaster tween the literature of knowledge and the literature of power. Of the latter kind is this sketch of the late Dr. Henry A. Coit, rector of St. Paul's School at Concord, New Hampshire, by "an old St. Paul's boy," Mr. James P. Conover. It is an inspiring book for all who, whether teachers or parents, have the perilous charge of either boys or girls in the budding time of adolescence. In teaching and discipline, as in theology, the heart counts for much, and so it counted at St. Paul's. To Dr. Coit must be accorded equal rank with that other prince of his profession, Dr. Arnold, of Rugby, and the task which he achieved, as the creator of a type of school new in New England, was greater than that of Arnold. It is a loving hand which has drawn his noble portrait. Appended to it are a paper by Dr. Coit on "An American Boys' School," a memorial sermon of his on "The Resurrection Life," and a number of tributes to his memory. (Memories of a Great Schoolmaster (Dr. Henry A. Coit). By James P. Conover. Houghton, Mifflin & Co., Boston. \$1.50, net.)

Origin and Development of the Moral Ideas

Although this massive work is elaborately ana-

lytical and critical, it is none the less interesting, not only to those who are fond of philosophical inquiry into the causes of existing conditions, but to those also to whom primitive customs and ideas present an attractive study. Whence, for instance, is derived our repugnance to receiving payment for the hospitality accorded to a guest? From the primitive dread of the stranger's "evil eye" and curse. A multitude of curious facts concerning the crude institutions of early times and savage tribes awaits the general reader of these pages. About onefourth of the volume is concerned with homicide, both in general and in its varying forms down to feticide. The philosophic student finds what he has a right to expect from such an investigator as Edward Westermarck, the author of the "History of Marriage" acute insight and discriminating judgment in tracing the evolution of moral ideas. high rank of charity among the virtues is shown to be due to the early religious connection of almsgiving with sacrifice rather than to the growth of altruistic sentiment. The development of this sentiment has not

been in intensity, but in its extension to classes not originally included in its range. The chapter on "Slavery" has been written, so far as regards slavery in the United States, upon imperfect information as to the attitude and testimony against it in American churches. That they were "the bulwarks of slavery" is true only in part. (The Origin and Development of the Moral Ideas. By Edward Westermarck, Ph.D. In 2 vols. Vol. I. The Macmillan Company, New York. \$3.50.)

Plays, Pleasant and Unpleasant Unpleasant These two very tastefully printed volumes contain the plays of

Mr. George Bernard Shaw which have been most widely talked about, and which bring out the various sides of his work. The pleasant plays are "Arms and the Man," Candida," "The Man of Destiny," and "You Never Can Tell;" the unpleasant plays are "Mrs. Warren's Profession," the production of which was interdicted in New York early last autumn, "Widowers' Houses," and "The Philanderer." Mr. Shaw is not only entertaining in his plays, as are some other men, but he is also immensely entertaining in his prefaces, a kind of writing which rarely reveals either glow or charm. The preface to one of these two volumes, "Mainly About Myself," is an extraordinarily entertaining bit of unblushing egotistical autobiography. (Plays, Pleasant and Unpleasant. By Bernard Shaw. In 2 vols. Brentano's, New York. \$2.50.)

St. Paul,
The Man and
His Work

This volume from the hand of Professor Weinel, of Jena, comes to us under

the auspices of a group of liberal theologians in the Church of England. as edited by one of them, Dr. W. D. Morrison. It is no new distinction which Professor Weinel recognizes between the work of the founder of Christianity, Jesus, and of Paul, the savior of it through his organization of it into a church. But, this distinction being made, two questions of vital importance follow. Can Christianity survive if separated from the peculiarly Pauline theology of the Church creeds? Again: Which is true-the stern morality of Jesus and Paul, with its note of hostility to the world, or the ethics of the Church in its compromise with the world? Professor Weinel lets go the Pauline theology except so far as explicitly authenticated by Jesus; he insists on the Pauline ethics. He finds in Paul's letters no trace of the later Trinitarianism, but sees a great advance in the field of ethics, raising the moral imperative from bounden duty to free desire, from a constraining law to a personal affection drawing to the Master. In this field Professor Weinel finds that the unsolved and formidable problems that have come down to us from the Reformation era have devolved upon present-day Christianity a demand for thorough work. His conception of Paul is that of a saintly hero, endeared by his human greatness and also by the human weaknesses that blended with it, a manysided man, still misunderstood and undeservedly disparaged, "a pattern of the perfect Christian gentleman," whose choicest passages should be read more frequently in the public schools. Innovator as he was, he was a true conservative. Though in him we find the starting-point of ecclesiasticism, of dogma, of liturgy, he unintentionally laid foundations on which they arose. He consciously aimed rather to steer the movement for a universal religion, which he started, away from fanatical excess, uncharitableness, and decay. Professor Weinel is no bloodless exegete or dry historian. He is deeply imbued with human sympathy for the living man he depicts. His translator, the Rev. G. A. Bienemann, has rendered him into lucid and finished English form. While the interpretation he puts on a text here and there can hardly command assent, he has admirably portrayed one of the greatest of mankind. (St. Paul: The Man and His Work. By H. Weinel. Translated by the Rev. G. A. Bienemann, M.A. Edited by the Rev. W. D. Morrison, LL.D. G. P. Putnam's Sons, New York. \$2.50)

Another volume of the Seven Years of the " American Nation " serial history has appeared. This deals with the important period 1811-1819, is aptly entitled "The Rise of American Nationality," and is written by Kendric Charles Babcock, President of the University of Arizona. The chief topic of the book is, of course, the War of 1812 and its results, and it is pleasing to find that President Babcock has not only mastered his subject but is able to treat it in a way that affords the uninformed student a clear, just, and adequate idea of the course of our second struggle for independence and its bearing on the National development. Like the other writers in this series, he depends mainly on original sources for his material, but he has not hesitated to avail himself of the researches of such authorities as Henry Adams and Captain Mahan, and of the enter-

taining memoirs of the period. Being the possessor of a vigorous and fluent style, he is thus able to impart a fresh interest to a long-explored theme. He cherishes no delusions respecting the unfavorable progress of the war, but he rightly lays stress on the immense gains it ultimately brought the United States. His chapter on the war's results is, indeed, by far the best in a work that is written exceedingly well as a whoie. Accuracy and impartiality are also distinctive characteristics, but from the standpoint of proportion there is no room for improve-President Babcock, for instance, would have acted wisely had he devoted less space to the peace negotiations and more to the brilliant naval engagements that went so far to redeem the failures of the land campaigning. His treatment of the many difficult internal problems of the seven yearsfinancial crises, tariff agitation, etc.—is on a par with his treatment of the war and other matters of foreign policy. At no time does he allow the interest to flag, and he is always explicit and forceful. Altogether his is a most creditable addition to this standard work. (The Rise of American Nationality. Vol. 13 of The American Nation. (Harper & Brothers, New York. \$2, net.)

The Spur A unique story, marked by much strength, but somewhat marred by the unrelieved wickedness of one man. Any one who knows aught of Australian or island life, of sheep farms, or copra gatherers and traders, will respond to this vivid writing, as those who know India used to respond to Kipling. The one improbability in it all, unfortunately, is found in the keynote of the plot. Kin, the hero, is a fine creation. The author, G. B. Lancaster, has written other tales. (The Spur. By G. B. Lancaster. Doubleday, Page & Co., New York. \$1.50.)

A Summer in the Apple-Tree Inn

This pretty play-house sheltered a group of children who were diverted by a Japanese companion. He, an educated youth, was the center of a romantic plot. Incidentally he taught the children courage and good manners, so that his restored fortunes were in reality simple justice to so exalted a character. The author is Ella Partridge Lipsett. (A Summer in the Apple-Tree Inn. By Ella Partridge Lipsett. Henry Holt & Co., New York. \$1.25.)

Armour's Extract & Beef

is to Meat what Cream is to Milk

Armour's Extract of Beef

has the flavor and richness of prime roast beef, concentrated and packed in convenient jars for household use. A small quantity added tosoups or sauces gives them that rich, beefy flavor that comes only from good beef.

Cooking without Armour's Extract of Beef is like making

fine pastry without cream.

Be sure you get ARMOUR'S Extract of Beef. There are a number of cheaper brands of inferior quality. Our Cook Book, "Culinary Wrinkles," tells how to use Extract of Beef in a hundred ways or more. It is sent free on request. All druggists and grocers sell Armour's Extract of Beef.

ARMOUR & COMPANY, :: CHICAGO

The Macmillan Company's Announcements

READY NEXT WEEK

The Life of Lord Randolph Churchill

By WINSTON SPENCER CHURCHILL, M.P.

When it became known that Mr. Churchill was engaged in writing a book dealing in an exhaustive manner with the brilliant career of his father, the liveliest anticipations were aroused in all circles where an interest is taken in the public life of England. Lord Randolph Churchill occupied so conspicuous a position among his contemporaries in political life, and impressed his personality so effectively on the public mind of his time, that it was immediately recognized that a book dealing adequately with his career, by a writer who in his turn has achieved distinction both as author and politician, must possess more than ordinary interest. In two volumes of more than eleven hundred pages in all; several portraits and some other

Price of the set, \$9.00 net. Carriage extra illustrations are included.

RÉADY JANUARY 13-THE SECOND EDITION OF

Salve Venetia! Gleanings from History

By Mr. F. MARION CRAWFORD. Illustrated by Joseph Pennell.

Two volumes in a box, crown 8vo, \$5.00 net. Carriage extra

The book presents in attractive form all that is stirring, picturesque, and memorable in the history, art, and architecture of Venice and the life of its people.—" Even better than the book on mediæval Rome does 'Salve Venetia' reveal Mr. Crawford's splendid gift as historian, as a medium for the dramatic presentation of the chronicles of a wonderful community." (Record-Herald, Chicago.)—"An ideal book about Venice." (New York Tribune.)—"Venice affords Mr. Crawford full opportunity for the exercise of his great power of dramatic presentation, and for graphic descriptions of bygone scenes which throb with life and reality." (Boston Herald.) Herald.

READY JANUARY 17

Pre-Raphaelitism and the Pre-Raphaelite Brotherhood

By WILLIAM HOLMAN HUNT, author of "The Life of Williamson," etc.

Two volumes. Richly illustrated. \$10.00 net. Carriage extra

Great interest has been aroused in all art circles by the announcement of this profoundly interesting contribution to the history of British art. The work will be uniform with the "Memorials of Edward Burne-Jones," published last fall. It will be devoted to the lives and work of that band of men who did more than any other to restore life and vitality and meaning to English art during the last century. "I trust," writes the author, "that my story of the private life of these men of genius will glorify them not less than those more ceremonious histories of their career, in which they appear as it were in stiff brocades and fine coats, donned to fence them from the eyes of the vulgar." The author was one of the three founders of the Pre-Raphaelite Movement.

NOW READY

The Modern Trust Company

By F. B. KIRKBRIDE and J. E. STERRETT, C.P.A. Cloth, 309 pp., \$250 net (postage 17c.) This is the first book to give a full and consistent description of the various lines of work in which a modern trust company engages. It discusses the duties of trust company officers and the relation of trust companies to the banking community and the public.

The Re-Shaping of the Far East

By B. L. PUTNAM WEALE, Author of "Manchu and Muscovite," etc. Cloth, 8vo, illustrated from fine photographs.

Two volumes in a box, \$6.00 net. Carriage extra

Mr. Weale's earlier volume, "Manchu and Muscovite," issued at the beginning of the late war, attracted much attention not only as "a remarkably interesting book . . . to be relied on absolutely as to the facts" (Boston Transcript), but also from the way in which the later events of the war verified the author's forecasts and vindicated his judgments. His new book, like its forerunner, is full of the genuine atmosphere of the East, is exceedingly readable, and gives a lucid summary of the political history of the last ten years in those countries. It explains fully how they have become entangled with each other and with rival European nations, and contains in Appendices the official text of the important treaties and other documents affecting the interests and nations at issue. The photographs showing scenes in the great war were

taken by Japanese officers during the actions, and were supplied for this book by the Japanese Government.

MACMILLAN COMPANY, 64-66 Fifth Ave., N. Y. THE

HOW OFTEN DO YOU OPEN YOUR DICTIONARY?

HOW MUCH DO YOU READ IN YOUR ENCYCLOPAEDIA?

Has it ever occurred to you that it was possible to construct a reference work which would have all the merits of an encyclopædia without any of its drawbacks? Have you ever seen a reference work which was in narrative form?

Have you ever bought a reference work which was so interesting that you found yourself reading it as you would read the latest novel?

THE HISTORIANS' HISTORY OF THE WORLD

is a fascinating, brilliant narrative of people and events from the building of the pyramids to the fall of Port Arthur. It is more. It is a reference work, as necessary to you as an encyclopædia, and a hundredfold more valuable, because it is a work which you will read.

Hugh Chisholm, the Editor of the Encyclopædia Britannica, commends in strongest terms the reference features of the Historians' History of the World.

Dr. John P. Peters, in speaking of its sustained interest as a narrative, writes, "It has proved so fascinating that night after night I have sat up until the wee small hours; one night shivering with the cold, and yet unable to tear myself away from the fascinating pages."

Please send me iurther details and illustrations of "The Historians' History of the World," also your special offer. You owe it to yourself or to your family to examine carefully into the merits of a work so unusual. You owe it to your business judgment to inquire about the History now, at once, while we can still extend to you our special offer.

THE OUTLOOK, - - NEW YORK
THE HISTORY ASSOCIATION, LONDON

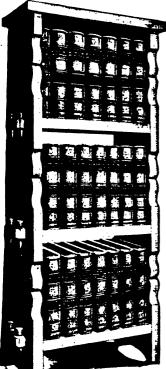

Digitized by Googlett T

The New International Encyclopaedia

has a greater scope for the average man to-day than any other work of reference, because it tells what the average man wants to know.

It presents in a clear, concise and uniform way what the majority of present experts consider the main features of every subject from the earliest times to those in which we live. |

¶ The "signed article" by one expert has given place to the "approved article" vouched for by many experts.

- LExpert editors have given this authoritative verdict encyclopædia form—thus insuring uniformity of treatment throughout the work.
- While it deals with everything everywhere, it deals with especial fullness, on all American questions, geographical, governmental, political and social, questions of finance, the trusts, insurance, municipal ownership, trades unions, etc.
- It includes biographies of our leading men in politics. business, the army and navy, the professions, in religious and philanthropic work, in literature, in music and on the stage.
- The illustrations bound together would make a volume larger than Webster's International Dictionary.
- The various departments bound separate would make nearly 300 volumes, costing hundreds of dollars.
- There are about 30,000 more articles in The New International Encyclopædia than in any other encyclopædia in the English language; there are 10,000 more biographies; there are more maps, more colored plates, more engravings and more illustrations of every kind, than in any other. But the real point lies not in the mere number of articles, nor in the quantity of biographies, nor in the great profusion of illustrations, but in the fact that every bit of information in The New International Encyclopædia is of interest to the average man.
- I Furthermore, the arrangement is so simple and com. plete, an answer may be found on any question without an instant's loss of time.

The Food Problem

HE food problem is not the one thing in housekeeping nor the only factor affecting health, but it is perhaps the most important. From our food we must derive all our power to think clearly, to work effectively, to live happily. Everyone should know the effect of the food he eats—its nutritive value, its fuel value, its money value, its digestibility, and the best methods for its preparation.

Diet is of especial importance. What food should the business man have to keep his mind and body in the best condition? What food is the best for the woman in the home? What is best for the manual worker? What for the growing child? The whole subject is taken up systematically in the Food Course of the American School of Home Eco-It is given by correspondence by acknowledged authorities and at small expense.

The attractive booklet of the School on the "profession of home-making" tells all about the Food Course, Health Course, Housekeeping Course, and Motherhood Course. The "Catechism on Home Economics" contains a long list of free Government Bulletins on pure food, diet, etc. Both booklets will be mailed free to those sending a post card or note addressed A. S. H. E., 3322 c Armour Ave., Chicago, Ill.

LADIES' BEST FRIEND

ONCE TRIED—ALWAYS USED

DEAR SIR: Your Frostilla entered my family years ago unheralded by any advertisement, and proved itself such a faithful friend in the matter of chapped hands, sore lips, and cutaneous eruptions, that we now lay it in by the dozen bottles. It is the best remedy I have ever tried for any irritation of the skin, and a most delightful toilet article for general use.

Gratefully yours.

MARION HARLAND.

Give effective relief in bronchial and lung troubles. Contain nothing injurious.

MALARIA???

Generally That Is Not the Trouble

Persons with a susceptibility to malarial influences should beware of coffee, which has a tendency to load up the liver with bile.

A lady writes from Denver that she suffered for years from chills and fever which at last she learned

were mainly produced by the coffee she drank.

"I was also grievously afflicted with headaches
and indigestion," she says, "which I became satisfied were likewise largely due to the coffee I drank. Six months ago I quit its use altogether and began to drink Postum Food Coffee, with the gratifying result that my headaches have disappeared, my digestion has been restored, and I have not had a recurrence of chills and fever for more than three months. I have no doubt that it was Postum that brought me this relief, for I have used no medicine while this improvement has been going on." (It was really relief from congestion of the liver caused by coffee.)

"My daughter has been as great a coffee drinker as I, and for years was afflicted with terrible sick headaches, which often lasted for a week at a time. She is a brain worker and excessive application together with the headaches began to affect her memory most seriously. She found no help in medicines and the doctor frankly advised her to quit coffee and use Postum.

"For more than four months she has not had a headache—her mental faculties have grown more active and vigorous and her memory has been restored.

"No more tea, coffee, or drugs for us, so long as we can get Postum." Name given by Postum Co., Battle Creek, Mich.

There's a reason. Read the little book "The Road to Wellville" in pkgs.

Mr. OWEN WISTER'S new novel

Lady Baltimore

By the author of The Virginian

"Mr. Owen Wister's 'Lady Baltimore' stands out in the weary waste of present-day fiction like a palm-tree in the desert. Here is taste, here is wit, delicacy, humor, . . . tempting one to apply many rather extreme expressions of approval to this book."—Baltimore News.

"A very different book from The Virginian . . . but a love story, pure and simple, dainty and full of grace. . . . Very rare indeed is it to come upon a novel which gives one so much satisfaction as does 'Lady Baltimore.'"

—Brooklyn Eagle.

"It is the quiet annals of an old Southern town told in the half whimsical, wholly sympathetic style of Cranford, to which it is closely akin in charm."

Record-Herald, Chicago.

Charmingly illustrated. Cloth, 12mo, \$1.50

THE ELECTION OF SENATORS

(American Public Problems Series)

By George H. Haynes, Author of "Representation in State Legislatures." \$1.50 net, by mail \$1.63.

Shows the historical reasons for the present system of election, and its effects on the Senate and the Senators, and on State and local governments, with a detailed review of the arguments for and

against direct election.

IMMIGRATION

(American Public Problems Series)

By Prescott F. Hall, Secretary of the Immigration Restriction League. \$1.50 net, by mail \$1.63.

"A fascinating subject as treated by Mr. Hall. . . . He writes with conviction but not with prejudice or passion. Perhaps nowhere else can be found equally full and conveniently arranged statistics, and as good an epitome of legislation."—N. Y. Times Review.

THE NEGRO AND THE NATION

By George S. Merriam. \$1.75 net, by mail \$1.98.

"Sensible people who wish to know, who wish to form good sound opinions, and especially those who wish to take their honest part in the great duties of the hour, will read the book, will study it, and will find nothing else better worth reading and study."—EDWARD EVERETT HALE.

AMERICAN TRADE UNIONISM.

J. H. Hollander and G. E. Barnett, Editors. \$2.75 net, by mail \$2.98.

"A study of trades unions in the concrete. Impartial and thorough . . . expertly written."

—N. Y. Times Review.

PROBLEMS OF BABYHOOD

By Dr. and Mrs. George Wells Fitz. With some twenty illustrations by E. A. Bell. Just published, 2d printing already called for. \$1.25 net, by mail \$1.33.

Discusses the vital problems connected with the constructive control of the baby's health and strength of body and of character. Based on the experience of the physician and the parent, it furnishes a rare combination of practical hygiene and accurate psychology simply interpreted and charmingly illustrated.

NATURE AND HEALTH

By Dr. Edward Curtis. Sensible advice on the care of the person and the home. \$1.25 net, by mail \$1.37.

"One can dip into it here and there, and be certain always of finding something worth while, told succinctly with a dry wit that, like the claws of the burr, makes it stick. . . . He believes in cultivating the imagination and the memory. His book will make its readers think."—Times Review.

"Writes from long experience and with simplicity of language and robust directness. . . . May be heartily commended to the lay reader desirous of leading a sane, clean, wholesome life."

—Literary Digest.

RAHAB

By Richard Burton, Author of "Forces in Fiction," "Lyrics of Brotherhood," etc. Just published. \$1.25 net, by mail \$1.31.

A verse drama portraying the fall of Jericho, with Rahab, the Old Testament enchantress, as the central figure.

"A poetic drama of high quality . . . simply and fluently written, with many felicities of phrase . . . there is plenty of dramatic action. The 'human interest' is sufficiently strong, . . . the tale one of repentance and pure love requited."—N. Y. Times Review.

THE DIVINE FIRE

By May Sinclair. A story of the regeneration of a London poet. \$1.50.

"Pervaded by . . . seriousness of invention and stamped with the distinction of high-class work manship. . . . A novel to be reckoned as one of the real things of the time."—The Outlook.

PUTNAM'S NEW BOOKS Send for New Illustrated Catalogue

Send for New

Reminiscences of Bishops and Archbishops

By HENRY CODMAN POTTER, Bishop of New York

8vo. With 13 photogravure Portraits.

In his own easy and graceful manner Bishop Potter has recorded illuminating anecdotes and experiences connected with tamous bishops. These reminiscences are very human and personal and reveal the men themselves under their vestments. Bishop Potter has done more than write a charming book; he has performed a genuine service in preserving these intimate memories of distinguished prelates, and some of the memoirs which his readers will find most precious concern himself.

From a College Window

By ARTHUR C. BENSON, Fellow of Magdalene College, Cambridge

Crown 8vo. Net \$1.25

A collection of familiar essays, in which the reader is brought under the spell of a singularly interesting and attractive personality. The book is a frank outpouring of the author's intimate thoughts, a frank expression of what he prizes and expects in life. The papers are characterized by the intimacy of self-revelation, the allusiveness and sense of overflow that belong to the familiar essay at its best.

In Thamesland

Cruises and Rambles through England from the Sources of the Thames to the Sea

By Henry Wellington Wack, author of "The Congo Free State," "Romance of Victor Hugo and Juliette Drouet," etc.

Crown 8vo. With about 100 illustrations and a map. Net \$3.00

A book literally packed with historic and romantic associations which adorn the story of the great little river. It is indispensable company in boat, trap, and automobile, and to all travellers in the region most characteristic of English life and manners.

Life in the Open

Sport with Rod, Gun, Horse, and Hound in Southern California

By CHARLES F. HOLDER, author of "Life of Darwin," "Big Game Fishes," etc.

8vo, 02 illustrations. Net \$3,50

Mr. Holder has ridden, driven, sailed, tramped, fished, and shot over every foot of the forest and sea, plain and mountain, which he describes so picturesquely and with such keen delight. His book is a chronicle of sporting experiences that carries along with it a good deal of exciting narrative and a considerable amount of interesting information in regard to social life, as well as the flora and fauna of the country he loves so well.

wheels in France

By MICHAEL MYERS SHOEMAKER, author of "The Heart of the Orient," "The Great Siberian Railway," etc.

8vo. With about 60 illustrations. Net \$2,50

The record of a motor-car trip of nearly 5000 miles over superb highways and enchanting byways through the Rhine Valley and thence to Switzerland. The volume is in no sense a guide-book; no set itinerary was followed with feverish haste, but, as fancy might direct, pausing in some ancient city or quaint village, climbing mountains to visit long-forgotten castles, or rolling into valleys in search of deserted abbeys.

THE GREAT SOUTHERN NOVEL THE "BISHOP" OF COTTONTOWN

By John Trotwood Moore.

Author of "A Summer Hymnal," "Songs and Stories from Tennessee," etc.

A magnificent, once-in-a-lifetime novel depicting the bright lights and deep shadows of Southern life to-day. It is a splendid story of love and passion, broad and human, filled with striking experiences of a quaint, knightly old character called the "Bishop," the hero of many thrilling adventures in the sacred cause of childhood and young womanhood.

The story of a grand pacing race, in which the "Bishop" enters his strange old horse, is one of the most graphic descriptions in literature. You fairly hear the hoof-beats as the foaming horses come down the stretch neck and neck.

To give you a taste of this matchless story, the publishers have bound, separately, the vivid chapter about the horse race. It is free to all who write for it. Frontispiece in colors and four drawings by the Kinneys. Price, \$1.50 at all booksellers.

THE SKULL TOAST BOOK
Compiled and illustrated by Clare Victor Dwiggins. 100 pages of Toasts with new and inimitable illustra-tions in "Dwig's" happiest vein.

Cut out in the shape of a skull and printed on Bone Color paper.
Price, Cloth, 60 cents, Leather, \$1.00.

THE RUBAIYAT OF THE EGG Written and illustrated by Clare Victor Dwiggins. Rhymes and sketches, funny and fantastic, about eggs. Printed on Yolk Yellow paper, Scrambled Egg finish. Cut out in egg shape,

Price, Paper, 25 cents; Cloth, 60 cents; Leather, pyrographic, \$1.00.

PANAMA

THE ISTHMUS AND THE CANAL

By C. H. Forbes-Lindsay, Author of "The Philippines," "India, Past and Present," etc. Cloth. 300 pages. 24 Halftone Engravings. 2 Maps from Latest Surveys. Price, \$1.00 net.

This work of intense and timely interest is absolutely required for a fair, up-to-date knowledge of the greatest question before the country to-day. Its author is well fitted, by his independent position, to tell the story of Panama impactially, and his statements carry the full weight of recognized authority. The story of the Isthmus reads like a romance from the days of the discoverers through those of De Lesseps, with his gigantic scheme and scandal, down to the recent events in the Republic of Panama, which have passed too rapidly for busy people to follow. All this history is given here in the most graphic manner. The description of the latest American plan for the Canal is presented in plain, simple language comprehensible to any reader. Excellent illustrations show the progress of the work, with fine portraits of those who are doing it.

NEW BOOKS FOR THOUGHTFUL READERS

NEW YORK CITY

FRENCH, GERMAN SPANISH or ITALIAN

> To speak it, to understand it, to read it, to write it, there is but one best way.

You must hear it spoken correctly, over and over, till your ear knows it.

You must see it printed correctly till your eye knows it.

You must talk it and write it.

All this can be done best by the

LANGUAGE - PHONE **METHOD**

Combled Rosenthal's Practical Linguistry

With this method you buy a professor outright. You own him. He speaks as you choose, slowly or quickly; when you choose, night or day; for a few minutes or hours at a time.

Any one can learn a foreign language who hears it spoken often enough; and by this method you can hear it as often as you like.

The method has been recommended by well-known members of the faculties of the following universities and colleges: Yale, Columbia, Chicago, Brown, Pennsylvania, Boston, Princeton, Cornell, Syracuse, Minnesota, Johns Hop-kins, Virginia, Colorado, Michigan, Fordham, Man-hattan, De La Salle, St. Josephs, St. Francis Xavier.

We simply ask you to investigate this marvellous system. Send for booklet, explanatory literature, and facsimile letters from men who know, which will tell you of the great merit of our system, also special offer to Outlook readers.

The Right Kind of a Vacation for a Boy

The right kind of vacation should interest a boy; should keep him out of doors; should refresh his mind and harden his muscles; and should give him the comradeship of good associates. All these conditions are ideally fulfilled by the Culver Summer Naval School, with its healthy and beautiful location on Lake Maxinkuckee; its extensive equipment; its large staff of experienced instructors; its fine class of boys from every section of the country; its interesting and muscle making drills in U. S. man-of-war cutters; and its attractive variety of athletic and aquatic sports. An hour or so of the forenoon is spent in study—the rest of the day out of doors. For beautifully illustrated catalogue, address:

The Headmaster.

CULVER SUMMER NAVAL SCHOOL, Culver, Indiana.

HOTEL GREAT CENTRAL

LONDON'S most magnificent terminus hotel in conjunction with the Great Penn Country; Sulgrave Manor, the accessful home of the Washingtons; Nottingham, the glorious Dukeries and great commercial cities of the North. THE HOTEL GRE AT CENTRAL is arranged on the model of a great English country mansion, designed to meet the demand for a hotel offering the utmost comfort at reasonable charges. Since its construction it has steadily grown in favour among the best English families, who, in many cases, adopt it as their Town House during the season. Situated on high ground, emoying the fresh, bracing air from the Northern heights and adjacent parks, an internal plan that permits free access of light and air to every room, lofty and spacious public apartments, the Great Central has the reputation of being the most healthful of London Hotels for summer residence, and visitors to London, returning to the Hotel Great Central, wearied after a day's sight seeing in the heat of the day amid turmoil of public places, find welcome relief and quietude, an oasis of repose, with freshness of atmosphere quite tonic and enlivening. TARIFFS and illustrated brochure from

Erecting a Memorial

is a sacred act which should enlist the most careful thought. Its size and style should be governed by the amount to be expended, and the location and surroundings of the place where it is to stand. In material it must be so faultless that it will serve its prime purpose—that of lasting for generations to come. workmanship it must be perfect.

Miller Monuments

The absolute satisfying of every taste in memorials of every high-class description has been my life work. My own designs—the finest of artists with the chisel—the use of only the highest-grade granite-lowest prices for supreme satisfaction-these insure the highest result.

Let me send you my illustrated book-free. It contains interesting information regarding

Bonds As a Reserve

FASONED Bonds are to-day recognized as the ideal investment for "reserve purposes" by the thoroughly informed Banker and Individual Investor.

It is an accepted fact that a portion of an Individual's or Institution's investments should be in "immediately convertible into cash" securities. Seasoned Bonds fully meet this requirement and are desirable for their security and income.

Bonds for "reserve purposes" are not confined to Railroads and Municipals. Good Traction, Light and Power issues are rapidly growing in favor as permanent investments, and some are admirably adapted for "reserve purposes," while yielding more liberally.

We are Specialists in "Seasoned" Bonds and aim always to be in position to promptly loan upon or re-purchase securities sold by us.

Write for our plan "BONDS AS A RESERVE."

be Key

ONEY saved is money earned. Money invested is money earning. Money saved systematically and invested wisely will ensure a competence in proportion to the amount saved. If you have surplus savings to place for immediate income or desire a safe and profitable channel for

systematic saving, we ask you to consider the unusual advantages afforded by A-R-E Six's, which are issued in either of the following forms:

A-R-E 6% Coupon Bonds

for income investment—purchasable at par in multiples of \$100; interest payable semi-annually by coupons attached; maturing in ten years and meanwhile subject to withdrawal on interest dates after two years.

A-R-E 64 Accumulative Bonds

for income funding-purchasable on instalments during 10, 15 or 20 years and enabling the person without capital available for income investment to accumulate a definite capital in a given time by simply investing each year the equivalent of an ordinary interest on the amount desired. This form also carries cash values after two years.

Illustration

A \$1000 Bond, payable in cash at maturity, costs:

\$71.57 yearly, \$18.30 quarterly or \$6.13 monthly, for 10 years,—total, \$715 \$40.53 \$10.36 \$3.47 , 15

Take life insurance for protection, use the banks for short time savings, but invest in business for business profits. In purchasing A-R-E Six's you not only invest your money in business, but in that one business which stands alone as the safest and most profitable in which money can be engaged—the ownership of New York real estateand thus share, to the extent of 6 per cent., in the assured profits of an established Company with ample resources, large experience and nearly two decades of uninterrupted success back of it.

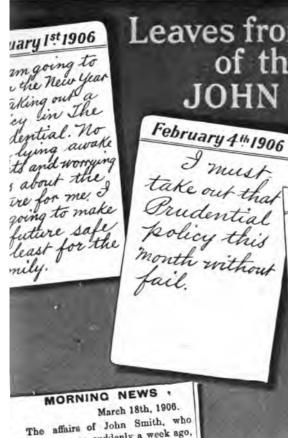

At the end of 18 years' business the Company's Assets of \$8,364,909.97, including a Surplus of \$1,185,047.03 representing profits accumulated in excess of interest on bonds, dividends and fixed charges, fully establishes its exceptional earning power and evidences the conservatism of its 6 per cent. rate.

We offer you the advantage of investment with us in this best of all securities. Write to-day and let us send you literature giving full information concerning our Bonds and the business upon which they are based, including a map of New York showing the location of our extensive properties.

LESCHETIZKY

The Greatest Living Teacher of the Pianoforte PRONOUNCES

The Pianola

The Only Piano-player Deserving Serious Consideration from the Musical World

The Aeolian Company, New York:

Gentlemen: - Of all the piano-playing devices which I have heard your Pianola is the only one deserving of serious consideration from the musical world. Apart from the faultless technic and almost human touch which your instrument has, it is equipped with an invention which is of equal if not greater importance — that is your Metrostyle, which gives the player a true and authoritative guide to the proper interpretation of a composition.

An individual feature of the Pianola is its absofute submission to the personality and feeling of the player, thereby affording one an opportunity of giving his own sentiment full play. This freedom of personal control is of the greatest importance.

Prof Theodor Kerchetylly Mien 8 Februar 1906.

AMONG musicians, this opinion from the greatest living the greatest living teacher of pianoplaying will come with tremendous weight. Who, if not Leschetizky, is able to settle beyond cavil the position of the Pianola in the sphere of musical art?

To the general public there are two points in Prof. Leschetizky's letter that

are of immediate and direct importance: First, that he unreservedly commends the Pianola in all of its features; second, that he is unwilling to give serious consideration to any other piano-playing devices that attempt in an imperfect manner to give similar results to the Pianola.

Caution—It is necessary for the intending purchaser to discriminate sharply between the Planola and all other Plano-players. To be genume, the word "Planola" must appear plainly upon the fallboard of the instrument. Send for Catalog X and name of nearest agent selling the **ensuine** Planola and Planola Plano.

Metrostyle Pianola, \$250; Pianola Pianos, \$550 to \$1000

Easy monthly payments can be arranged

MEDICAL OPINIONS OF

BUFFALO LITHIA WATER

"I Prescribe It with the Utmost Confidence in Indigestion Due to Chronic Catarrh of the Mucous Membranes"

Dr. Wm. H. Doughty, Augusta, Ga., Professor of Materia Medica and Therapeutics in Medical College of Georgia: BUFFALO LITHIA WATER of Indigestion due to Chronic Catarrh of the Mucous Membrane, with excess of acid; also in the secondary or symptomatic dyspepsia of uterine and renal origin."

"In Lithaemia I Always Advise Its Use"

Dr. Stuart McGuire, Richmond, Va., Surgeon in charge of St. Luke's Home, Professor of Principles of Surgery, and of Clinical Surgery, University College of Medicine, Richmond, Va., etc.: "In cases of headache from lithæmia, of headache from passive congestion of the kidneys, of strangury from concentrated urine, and a host of other ills, I always advise BUFFALO LITHIA WATER."

"A Remedy of Great Potency"

Louis C. Horn, M.D., Ph.D., Professor of Diseases of Children and Dermatology in Baltimore University, writes:

BUFFALO LITHIA WATER in my practice in the past eight or nine years, "Having used BUFFALO LITHIA WATER I find it the most pleasant and most reliable solvent in Chronic Inflammation of the Bladder and Renal Calculi; also in gouty and rheumatic conditions. It is a remedy of great potency."

"Have Used It with the Most Satisfactory Results"

Dr. Lewie Boeher, Richmond, Va., Professor of Surgery, Medical College of Virginia: "I have frequent-buffer with the most satisfactory results in all conditions where used BUFFALO LITHIA WATER an active diuretic is indicated, and have found it especially serviceable in Rheumatic and Gouty Conditions, Albuminuria of Pregnancy, Catarrh of the Bladder, and other diseases affecting the urinary organs."

Additional testimony on request. For sale by the general drug and mineral water trade.

Hotel at Springs opens June 15th.

PROPRIETOR, BUFFALO LITHIA SPRINGS, VA.

TARTARLITHINE

We have received the following from a correspondent in Malden, Mass.: I have been a sufferer from rheumatic gout for many years; have taken lithia in various forms, but this preparation of Tartarlithine seems to commend itself to my judgment, and, therefore, I am happy to introduce it to others.

Rheumatism

Tartarlithine rarely fails because it supplies the blood with the necessary substances to dissolve and remove the poison of rheumatism—uric acid. We want every sufferer to try it, and will send a sample package with our booklet on the cure of rheumatism free to every applicant.

Free sample and our booklet on the cure of Rheumatism sent on request

McKESSON & ROBBINS

Dept. L., 93 Fulton St., New York Sole agents for the Tartarlithine Co.

The double chin is the bane of the plump woman and often gives a premature matronly appearance to a young woman.

Double chins are caused by loose skin, sagging flesh and flabby muscles. These are unnatural conditions. When natural conditions are restored by the use of

Pompeian Massage Cream

the double chin disappears as though by magic. Pompeian Massage Cream makes the skin velvety, strong-textured and fine-grained, the flesh solid, the muscles pliant, but firm. It does more—it will take out all wrinkles, round out the contour of face, neck and bust, and bring color to the cheeks.

Test it with Our Free Sample

Simply write us you want to try it, and we will send you the sample together with our illustrated book on Facial Massage, an invaluable guide for the proper care of the skin.

Suggest to your brother or husband that he try Pompeian Massage Cream after shaving; by cleansing the pores of soap it allays irritation, does away with soreness.

> All leading barbers will give a hand massage with Pompeian Cream—accept no substitutes.

Pompeian Massage Soap is appreciated by all who are particular in regard to the quality of the soap they use. For sale by all dealers —box of 3 cakes, 30 cents.

We prefer
you to buy of
your dealer whenever possible, but do
not accept a substitute
for Pompeian under any circumstances. If your dealer does
not keep it, send us his name, and
we will send a soc. or \$1.00 jar of the
cream, postpaid on receipt of price.

POMPEIAN MFG. COMPANY
11 Prospect Street Cleveland, Ohio

Here's a timely warning from the President of the New York Board of Health:

"The open garbage pail is as dangerous a health menace as bad drainage."

You wouldn't take chances with sewer gaswhy risk disease from the offensive odors of decaying garbage?

The only way to make garbage odorless and harmless is to keep it in Witt's Corrugated Can.

Then, no matter which way the wind blows, nobody gets a whiff.

The lid, stamped out of one piece of steel, rigid, fits closely over a strong steel band; easy to put on and never gets out of shape all the years the can lasts.

There's nothing about Witt's Can to wear out.

Made of steel, galvanized inside and out. No iron supports to rust or break off, corrugations give support everywhere alike.

Ask at the stores for Witt's Can and look for "Witt's Can" stamped on lid.

If not on sale in your town order direct from us. Use it and if you don't like it, we'll pay for its return and promptly refund your money.

Dealers sell Witt's Can the same way,

The Witt Cornice Co., Dept. O, Cincinnati, O.

"For Want of a Nail the Shoe was Lost; For Want of a Shoe the Horse was Lost"—

00000000

For want of zinc the paint was lost,—for want of paint the house was lost.—It is far more economical to paint a house too soon or too often than not to paint soon enough or often enough. Paint is cheap, but the beauty it produces and the protection it affords are not cheap. Paints based on OXIDE OF ZINC are more beautiful, more durable, and more economical than other paints; there is a choice here as in other things. Don't let your building look shabby or fall to pieces for the lack of paint, and, while you are about it, see that you get the best kind of paint.

A Suggestive Pamphlet,
"Paint: Why, How, and When,"
FREE to property owners.

"TAKAPART" REEL

the better you will like it

Can be taken apart without tools.

Its solid tubular frame and reel seat made from one piece, steel shaft pinion gear, and bronze adjustable bearings that cannot work loose, give it unsurpassed wearing qualities combined with lightness and strength.

Its watchlike adjustment and perfect finish in every part make it positively the smoothest and best running for bait-

casting on the market.

Dr. C. M. Luckey, who used it in making his wonderful record, winning over all competitors, at Madison Square Garden, writes: "I sincerely advise every sportsman who wishes to leave his troubles behind to carry a 'Takapart' Reel. It is always ready for action and never goes wrong."

We will make all repairs free.

The exclusive friction device prevents backlashing. Handle adjusted to four positions. 80 to 100 yds. Price \$6.00. Send for free booklet. All dealers have it.

A City Water Supply

For Your Country Home

F you live in the country there is a way for you to enjoy all the comforts and conveniences of a city water supply, without a penny for water tax.

It is accomplished by the Kewanee System.

With the Kewanee System you get even more than city service, because, in addition to every benefit the latter affords, you may have

-Soft water in your bathroom and laundry.

The old-fashioned gravity system meant pumping water up in order to get it down again.

Now, to give the necessary pressure for fire protection and service, the elevated tank must be located on top of a tall tower. This is expensive, unsightly, and unsafe.

The water freezes in winter, becomes warm and stagnant in summer, and repairs are a big item of expense.

The attic tank doesn't give sufficient pressure for fire protection. Its weight is apt to crack the plastering, and when it leaks (as it is pretty sure to do) your house is flooded. Just one such expensive accident may cost you many times the price of a Kewanee Outfit—

—Which cannot flood the house because the tank is resting on solid ground, where it can do no damage.

The installation of a Kewanee Pneumatic Tank and Outfit in the cellar (or in the ground) means:

—Plenty of pure, fresh water,

—Cool water in the summer,

No freezing water in winter

Absolute protection from fire,

-Decrease in insurance rates, -A plant that will last a lifetime,

No expensive repairs, -It solves the country water problem completely.

The **Kewanee System** will take care of *all* your needs,—for home, garden, lawn, stables, poultry houses, etc.

Our Kewanee Outfits are complete.

Not an engine only;—which in itself cannot give you a water supply,—nor a tank only, which is useless unless you have some form of pumping power—

But, we furnish the whole thing,—a complete system of

water supply.

Our engineering department is prepared to solve your water problem,—no matter how difficult that problem may

now appear.

Kewanee Outfits are made in sizes, suited to the smallest cottage or largest building,—or group of buildings.

We guarantee every Kewanee Outfit to give perfect

Explains how to produce all latest wood-finishes. How to make pine look like beautiful hardwood. Every home should have this book. Write today. The price is 25 cents, but for a limited time it will be sent free on request by the manufacturers of

==Johnson's== :Prepared Wax=

"A Complete Finish and Polish for All Wood"

For Woodwork, Furniture and Floors

Applied with cloth to bare or all finished wood, it produces a lasting, artistic, sanitary finish, to which dust and dirt will not adhere. It will not crack, blister, peel off, show laps, scratches or heel marks. Johnson's Wax is far superior to any other, one reason is that it contains the most polishing wax to the pound.

Fine for preserving and polishing oilcloth and linoleum. Just try it.

Johnson's Prepared Wax is sold by all dealers in paint—1/2-lb. can, 30 cents; 1 and 2 lb. cans, 60 cents per pound; 4, 5 and 8 lb. cans, 50 cents per pound.

Write today for the above book and mention edition T_5 .

S. C. Johnson & Son

Racine, Wisconsin

"The Wood Finishing Authorities"

Linen—for Freedom

Freedom from the "stickiness" of "close" days. Because the firm, glossy Linen threads stand apart as woven and let the air circulate freely through their meshes. That keeps them dried out and you feel clean and comfortable. And freedom from colds, too.

Because your pores—those busy little heat

regulators are free to work.

And when they do work they never let the temperature of the body vary more than a degree, summer or winter.

Cotton and woolen underwear hug the form.
Their soft, down-like fibres, "mat" and
"pack," get soaked with perspiration and you
are encased in clammy dampness, feel sticky

and uncomfortable.

But, worse still, your pores are choked, quit work, and you catch cold—mayhap contract grip, pneumonia or rheumatism.

Not so with firm, dry, clean Linen,
And that's why your Doctor says "Linen
next the skin"—a prescription as pleasant as
it is healthful. When he says Linen that means
Kneipp Linen, because it's the only pure unmixed Linen Mesh Underwear made.

All other so-called Linen Meshes contain cotton, but the Kneipp Mesh is pure Irish Linen

and nothing but Linen. Its easy, loose fit and "open weave" next the skin leave the pores free to establish the natural temperature of the body.

Its closer woven surface or exposed side protects the temperature thus established.

See both sides of Kneipp Linen Mesh in the folded strip that makes the streamers for the seal. But samples of our several weaves and weights are free—so write for them today.

Sent For Free Inspection

The best dealers everywhere sell Kneipp Linen Mesh Underwear for Men, Women and Children, On request we will send eamples of the different weights and meshes and give you the names of our dealers in your town. If we have no dealer near you we will send Kneipp Underwear direct to you for free inspection. Write today for free Linen Book. It tells the simple proved truth about Linen for Comfort and Health.

Kneipp Wear-Guarantee

The manufacturer's strong wear-guarantee standabehind every garment. If it does not wear estisfactorily your dealer will replace it on his judgment without consulting us ...—orw will if you deal direct with us. Our sweeping wear-guarantee protects both our dealers and the wearer.

913 Filbert Street,

REASONS:

ONE—Every cigar that I sell is manufactured right here in the cleanest cigar factory and under the most careful sanitary conditions

that I have ever seen. It is "finicky" clean, according to some.

TWO—This factory is very close to the business center of the third largest city in the United States, within ten minutes of the City Hall and Broad Street Station, and but five minutes from the Reading Terminal. People familiar with Philadelphia will recognize the fact that I am not trying to hide my factory.

THREE—All visitors to my office are invited to go through the factory and see the cigars made. They can readily see that I am not trying to hide anything in it.

FOUR—My cigars are shipped direct from the factory to my customers, in the best possible condition.

FIVE—The fillers of these cigars are clear Havana of good quality not only clear, but long, clean Havana-no shorts or cuttings are used. The wrappers are genuine Sumatra. They are hand made, by the best of workmen. making has much to do with the smoking qualities of a cigar.

SIX (and best)—I sell them to the consumer by the hundred at wholesale prices.

MY OFFER IS:-I will, upon request, send one hundred Shivers' Panatela Cigars on approval to a reader of The Outlook, express prepaid. He may smoke ten cigars and return the remaining ninety at my expense, if he is not pleased with them; if he is pleased, and keeps them, he agrees to remit the price, \$5.00, within ten days.

In ordering, please enclose business card or give personal references, and state whether mild, medium, or strong cigars are desired.

A FINANCIAL COURTSHIP

Or a Plea for Conservative **Investments**

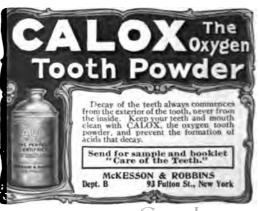

(By Frank W. Rollins)

"Hon. Frank W. Rollins, ex-Governor of New Hampshire, has just issued from his banking house of E. H. Rollins & Sons of Boston a brochure that ought to be in the hands of every woman. It is called 'A Financial Courtship,' and, as the author, Governor Rollins himself, states in his preface, was originally written at the suggestion of his stenographer, who spoke of the need that women have for a simple, concise book that will tell them all about investments.

"Governor Rollins puts his information in the form of a story, thus making it interesting reading. But, in addition, his facts and suggestions are clear-cut and eminently useful. He explains the meaning of a mortgage, a bond, corporation stock, municipal investments, government bonds, and so on through the list of conservative investments. Any woman who has money to invest or who is likely to inherit money which she will be called upon to invest will be well guided by this book. In fact, it would serve admirably as a text-book for young people of both sexes."—Boston Journal.

Copies of the above book will be furnished without cost on application to E. H. ROLLINS & SONS, 21 Milk Street, Boston.

For 1 Mile or 1000 Miles

The Type XII, Pope-Toledo, is the Fastest, Most Powerful Stock Touring Car in America

35-40 H. P. Full Equipment, Price \$3,500

Please note carefully that we say one mile or a thousand miles—Moreover, the Type XII, 35-40 H. P. Pope-Toledo, will run more miles at less cost for tires, fuel and repairs, and with less adjusting than any high powered touring car in the world. Transmission is made of the new chrome nickel steel, having a tensile strength of 225,000 pounds, and is, without question, the strongest, most silent and smoothest running transmission ever placed in an automobile. This year we have adopted the "I" Beam form of axles, drop

forged in our own plant from steel having a tensile strength of 110,000 pounds. Both foot and emergency brakes act on the rear hub bands, thus relieving all brake strain and wear on the transmission. Engine throttles down to a point making it possible to drive behind a team walking, or gives the maximum efficiency of the engine all on the high gear. Catalogue of 20-25; 35-40; 40-50 and 60 H. P. Avoid a Trip to the Police Court

The fine amounts to little—it's the hours of delay, the inconvenience and possible humiliation for you and for those in your company that try the patience and spoil the pleasure of the whole trip.

All this can positively be avoided by equipping

your car with

liles per Hour

KNOW how fast

raveled

The Warner **Auto-Meter**

(Registers Speed and Distance)

This little instrument always tells the truth. It registers with ABSOLUTE ACCURACY from % mile to 60 miles per hour. It attaches to any Automobile made.

Without it you never know your exact speed — and the temptation to go a little faster and a little faster is almost irresistible—you know how it is.
And you know, too, what happens to you and your party when
you think you are going 8 miles
an hour and the Policeman's stop watch says 15.

Don't guess yourself into trouble—KNOW and keep out of it. The Warner Auto-Meter is your salvation.

And it's your ONLY salvation. Because the Warner Auto-Meter is the only speed indicator which is sensitive enough to be absolutely and unfailingly accurate at speeds under 10 miles an hour.

Because it's the only one which works perfectly in all positions and at all angles, on rough roads or smooth, up hill or down.

Because it's the only one which changes with the speed alone and in which the indicator does not dance back

and forth from the jar of the car.

The Warner Auto-Meter is the only speed indicator which is actuated by the same fixed, unchangeable Magnetism which makes the Mariner's Compass reliable FOREVER under all conditions.

669

SEASON

No one else can use Magnetism to determine the speed of an Automobile, though it's the only positive and sure way. Because there is just one way in which Magnetism can successfully be used for this purpose and we have Patented that way.

There is nothing about the Warner Auto-Meter which can give out, or wear out, or get out of adjustment. It is the only speed-indicator made without sams, plates or levers, and in which there is no friction. tion. Friction wears away the cams and levers in ther speed indicators, which are necessarily so small hat I-1000 of an inch wear will throw out the readng from one to five miles per hour.

One Warner Auto-Meter will last a life-time. It is as sensitive as a Compass and as Solid as a Rok. Otherwise it couldn't stand our severe service-test, which is equivalent to a trip of

160,000 Miles at 50 Miles per Hour on Granite Pavements Riding Solid Tires. The practical Warner Testing Machine is shown in Fig. 1. The wheel connection of the Auto-Meter is attached to a shaft running

200 revolutions per minute. Across this shaft lies a plank which is hinged at one end and has the Auto-Meter attached to the other. Brazed to the shaft is a knob of steel, which at every revolution "bumps" the plank, giving to the Auto-Meter 200 shocks per minute while it is showing a speed of \$\mathfrak{O}\text{miles per hour.}\$

Each one of these shocks is more severe then would be suffered in a partite sanger.

than would be suffered in an entire season's riding. After running 10 hours a day for THREE MONTHS, actual tests show the Auto-Meter to be recording the speed with the same accuracy as at first within 1-1000 of 1%, or less than 6 inches per mile.

No other Speed Indicator on Earth could Stand this Test.
This is why we sell each Auto-Meter on a 10 YEARS GUARANTEE

and why we gladly renew any Auto-Meter (which has not been injured by accident) if the Magnet (the HEART of the instrument) is less accurate than 1-10 of 1% after 10 years use. We will gladly tell you more about this wonderful instrument if you will write us. If you write TODAY we will send you something every motorist will prize—our Free Book—"Auto Pointers."

The Warner Instrument Co., 193 Roosevelt St., Belott, Wis.

(The Auto-Meter is on sale by all first-class dealers and at most Garages.)

ORTHER Silent, Safe, and Dustless

A demonstration and a careful investigating comparison will quickly convince you of the importance and value of the Northern Three-point Motor support, encased mechanism, positive lubrication, and twenty-four inch fly-wheel. When you realize that the Silent Northern has the simplest, strongest mechanism of any car—that it is noiseless and dustless, supremely easy riding, and the price only \$1,200, you will see why it is the car for you. Catalogue 51 illustrates seven distinct models, including the Sturdy Northern Runabout at \$650. Let us send you a copy. Write to-day, MANUFACTURING CO., DETROIT, U. S. A. Even the Tots Can Play and Enjoy the Krell Auto-Grand Piano

From nursery to music room may seem a far cry, but, it is merely the step of a Lilliputianif you have a Krell Auto-Grand Piano. With that

instrument a child's touch takes on the rare quality of a master, and

the four-year old boy or girl, the same as older people, can produce without study or practice, the most charming of music.

Two Ways Are Better Than One

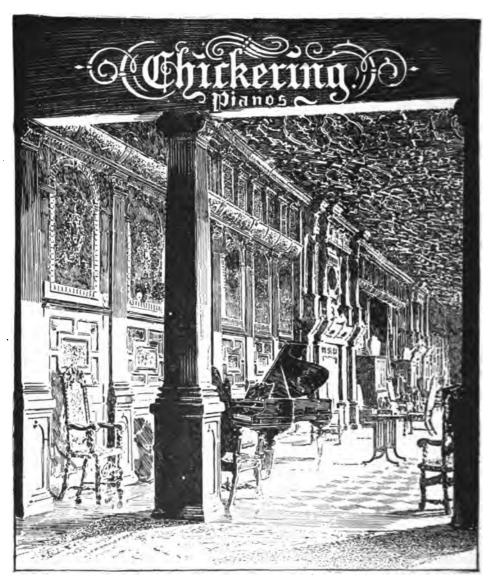

The Krell Auto-Grand Piano is a delight to the artist's soul. Its singing quality and exquisite tone cannot be excelled, and the same unsurpassed points are brought out mechanically by the simple turning of a lever. That action transforms it into an automatic instrument, operated by perforated rolls of music. It will play any standard music of 65 notes, and over 25,000 selections are already on the market. This gives the purchaser a larger selection and variety, than if requiring music made for only some one particular player.

The Krell Auto-Grand Piano possesses a durable charm. The tubing is all of metal, and will never wear ont. Others use rubber. Easily tuned and adjusted. Fully guaranteed for five years, Catalog F and terms, in themselves superlatively attractive, for the asking.

THE AUTO-GRAND PIANO CO., New Castle, Ind.

We offer original plans for increased profit to Dealers, who are invited to write.

CONCERNING THE "QUARTER (1/4) GRAND"

TS Tone Quality is superior to that of an Upright. It occupies practically no more space than an Upright. It costs no more than the large Upright. It weighs less than the larger Uprights. It is a more artistic piece of furniture than an Upright. It has all the desirable qualities of the larger Grand Pianos. It can be moved through stairways and spaces smaller than will admit even the small Uprights.

WATER

A supply of water for country residences, hotels, schools, etc., being a necessity rather than a luxury. the importance of having the supply constant, as well as easily procured, is self-evident. Before the invention of the

Rider and Ericsson Engines

this question of water supply was a vexed one, and not often satisfactorily solved. Since the invention of these engines many thousand residences, schools, hotels, stock farms, etc., have had a constant daily supply of water without danger, complication or material expense. Many of the largest colleges, such as Harvard, Cornell, Columbia, University of Michigan, and many others have the engines in their mechanical laboratories as being the standard machine for illustrating to their students. Thousands of the most prominent citizens of this country, as well as other countries, use them; many of the rulers of other countries, including King Edward VII and the Khedive of Egypt, have the engines in their palaces. The heads of the greatest engineering establishments in this country, such as the Baldwin Locomotive Works, Westinghouse Machine Works and Allis-Chalmers Company, pump the water at their country places with Rider or Ericsson engines. Almost every public school in New York City has one or more of the engines supplying water for the use of the students. Many of the most prominent stock farms in this country pump all of the water for their fine cattle with Rider or Ericsson engines. These facts may not be conclusive, but to the average mind are important. Such people do not buy inferior machines if better ones are in existence. The celebrated Captain Ericsson, of Monitor fame, the inventor of the Ericsson Hot-Air Pumps, considered the Ericsson Pump the most important, from a utilitarian standpoint, of all of his inventions. A boy who can build a fire in an ordinary stove is competent to take entire charge of a Rider or Ericsson Pump. and the cost of running them, with any kind of fuel, is practically nothing. Their absolute safety under all circumstances is not an unimportant consideration. Owing to the recent reduction in the price of many materials we are able to make a discount of 10 per cent. from our present list prices without in any way affecting the quality of the engines. practically no more space than en than the large Is In writing to any of our stores for information delay " "

The people have been knocking at the doors of Congress for a pure food law—a law that will protect them from adulterated, misbranded foods.

You can join "the pure food movement" NOW by eating a pure food—a food YOU KNOW is pure and clean—a food that stands the Test of Tooth and Time.

Such a food is shredded whole wheat, made of the best white wheat that grows, cleaned, cooked, drawn into light porous shreds and baked.

The "Tin-Can Age" calls for a Tin-Can Stomach. Have you got one? Don't leave it to Congress. YOU are the "Speaker of the House" in your own home.

Shredded Wheat is not "treated" or "flavored" with anything—not touched by chemicals or human hands—made in the cleanest, finest, most hygienic industrial building on this continent.

Every detail in the process of cleaning, cooking and shredding wheat is open to the world--no "secret process"--nearly 100,000 visitors last year. YOU are invited.

THE SISCUIT (warmed in the oven) is delicious for breakfast with hot milk or cream or for any meal in combination with fresh fruits, creamed meats, or vegetables. TRISCUIT is the shredded wheat wafer, used as a toast with butter, cheese, or preserves.

Our new booklets are sent free.

Thosewhowouldhe"wellgroomed"

sometimes overlook the importance of or are careless in the selection of shoes.

You have noticed this:-

The "well groomed" man is always well shod.

In shoes, as in all things else, you generally get what you pay for; but in

Hanan Shoes

there is something more than the intrinsic value represented by leather, workmanship and modern machinery. It is that indefinable thing which results in a proper blending of style, good taste, and absolute comfort, and all this depends upon the skill of the last maker. The touch of distinction is the "Hanan in the Shoe." A Hanan of the third generation makes the pattern lasts.

The Hanan last is just like the human foot, because the human foot is used as a model. A preliminary last is designed; shoes are made on it and tested for weeks. If they pinch or bind anywhere, the last is changed and new samples made and tested. When each shoe fits perfectly—no wrinkles, no tight spots, no loose spots—then the last goes to the workrooms. It's expensive, but it's the only way to produce a smart, stylish shoe which will fit perfectly and be absolutely comfortable.

Shoes for Men and Women

The Solution of **Perfect Sanitation**

is exemplified in the escape of sewer gas; the fact that absorption of poison by the material of which common closets are made (iron for instance); and

the gradual discoloration of those interior parts which furnish a prolific breedingground for millions of death-dealing bacilli.

The action of the SY-CLO is two-fold. Besides the copious flush of water, there is an irresistible syphonic action, which, like a powerful pump, literally pulls the contents through the outlet channel, cleansing, scouring, polishing as it goes, leaving the INSIDE of the pipe as clean and smooth as a china bowl. And this is send the name of your plumber. a truism because the SY-CLO is solidly without joint or break or rough place inside or out to furnish lodgment for dirt or disease germs.

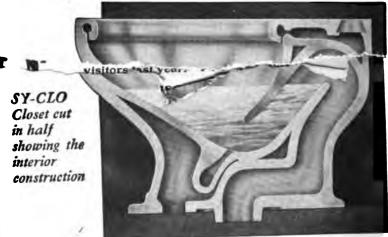

Examine your closet; if it is made of SY-CLO Closet, the enameled iron or has just an ordinary flush, construction and action discard it at the first opportunity for a of which ends at once SY-CLO. Your doctor pays the bill. all the subtle dangers of you are building a house or buying one, disease arising from im- insist on SY-CLO Closets with the trade proper cleansing; the mark name burned in the china. The

Closets cost but little more than other closets—that, with ordinary care, they will last as long as the house in which they are installed, leaves no further excuse for sewer sickness. Ask the plumber. A book on "Household Health" mailed free if you

Lavatories of every size and design constructed of china-pure white china- made of the same material, and on the same principle, as the SY-CLO.

Why not Let HEINZ Supply Your Home Preserves?

HELY2

57

VARIETIES

Instead of doing your own preserving, why not get your family supply from the many choice varieties prepared by Heinz?

It's a long step toward easier housekeeping—and often to better food, for in the Heinz Kitchens preserving is done with equipment and experience that no single home could possess.

Choice, specially-selected fruits and pure granulated sugar—nothing is ever used but these in Heinz Preserves. There can be no question as to purity or cleanliness, for our work is clean by system, with superior facilities and tidy helpers to carry it out.

Even so small a thing as the seeding of a cherry, or the hulling of a berry, receives the individual attention of an experienced worker whose sole thought is, how clean—how well.

This exactness of the Heinz Way manifests itself most forcibly in the goodness and excellence of our foods.

There's greater variety in Heinz Preserves than mostly found in the home stock—Pineapple, Strawberry, Cherry, Peach, Raspberry, Damson, etc. In sterilized crocks, jars or our specially-made sanitary tinsof convenient sizes.

The whole story of Heinz Preserves—as well as of the famous 57 Varieties—is told in "The Spice of Life," a copy of which we will send you upon request.

H. J. HEINZ COMPANY,

New York Pittsburgh Chicago Lone

The Knabe Angelus

COMPETENT critic declared that this player-piano "presents an irresistible strength and is an attraction which must appeal to the

public as no other existing combination can."

He did not overstate the fact, and how could he, for this instrument is the combined product of the two companies — Wm. Knabe & Company and The Wilcox & White Company — occupying the foremost positions in the manufacture of pianos and

piano-playing devices.

The touch and incomparable tone of the Knabe Piano are not impaired by installing the ANGELUS entirely within the piano case, so the instrument is perfectly satisfactory to the trained musician of the highest artistic standard and is a never failing source of delight and entertainment to everyone who plays it by means of the ANGELUS.

For ten years the ANGELUS has been constantly developed by its inventive originators to its present point of superiority. It possesses peculiar and original mechanical advantages such as the wonderful melody buttons and the famous phrasing lever and the diaphragm pneumatics producing the human touch. These give the performer the means to produce truly artistic music and obtain effects not possible with any other piano player.

The case of the KNABE-ANGELUS is of elegant design and beautiful finish and is made of most carefully selected veneers of choicest figure.

Write for handsome booklet and name of our nearest local agency.
